FAST (a word common to the Teutonic
which Grimm derives from a root signifying
to hold, keep, observe, and hence to restra
self; Lat. *jejunium*, Gr. *nēsteia*, Hebr.
the word used to express a certain self-im
restraint with respect to the nourishment
body. The abstinence enforced may be
partial, when the restriction is confined to
articles of food; or total, when all susten
dispensed with for a specified time. The
the custom seems to be coeval with

experience of the salutary influence which abstinence exercises on the health, and with his more or less instinctive consciousness of the necessity of retaining the body in due subjection to the soul. By degrees, the self-mortification which it implied raised it into a sacrifice offered to the Deity; it became a religious observance, was surrounded with rites and ceremonies, and finally bore the stamp of a divine law. Climate, the habits of a people, and their creed, gave it at different periods different characteristics; but it may be pronounced to have been a recognised institution with all the more civilised nations, especially those of Asia, throughout all historic times. We find it in high estimation among the ancient Parsees of Irania. It formed a prominent feature in the ceremonies of the Mysteries of Mithras; and found its way, together with these, over Armenia, Cappadocia, Pontus, and Asia Minor, to Palestine, and northward to the wilds of Scythia. The ancient Chinese and Hindus, and principally the latter, in accordance with their primeval view - which they held in common with the Parsees - of heaven and hell, salvation and damnation, of the transmigration of the soul, and of the body as the temporary prison of a fallen spirit, carried fasting to an unnatural excess. Although the Vedas attach little importance to the excruciation of the body, yet the Pavaka, by the due observance of which the Hindu believer is purified from all his sins, requires among other things an uninterrupted fast for the space of twelve days. Egypt seems to have had few or no compulsory general fasts; but it is established beyond doubt, that for the initiation into the mysteries of Isis and Osiris, temporary abstinence was rigorously enforced. In Siam, all solemn acts are preceded by a period of fasting, the seasons of the new and full moon being especially consecrated to this rite. In Java, where abstinence from the flesh of oxen is part of the religion of all, Buddhists and worshippers of Brahma alike, the manner and times of the observance vary according to the religion of the individual. Again, in Tibet, the Dalai-lamaites and Bogdo-lamaites hold this law in common. That Greece observed and gave a high place to occasional fast-days such as the third day of the festival of the Eleusinian mysteries, and that, for instance, those who came to consult the oracle of Trophonius, had to abstain from food for twenty-four hours is well known. It need hardly be added, that the Romans did not omit so important an element of the festivals and ceremonies which they adopted from their neighbours, though with them the periods of fasting were of less frequent recurrence. See THESMOPHORIA.

As to the Semitic races, although we find the people of Nineveh undergoing occasional fasts, to which even animals were made to conform, yet the Mosaic law set apart one day only in the whole year for the purpose of fasting. The 10th day of the seventh month (Tishri), called 'the Day of Atonement' (Yom Kippur), or, as the holiest of the whole year, 'the Sabbath of Sabbaths,' was ordained for 'the chastening of the *Nephesh*,' which the traditional law explains as meaning the strictest and most rigorous abstinence from all food or drink, as also from washing, anointing, the putting on of sandals, &c., from the sunset of the ninth to the rising of three stars on the evening of the tenth day. In process of time, five days of compulsory fasting were added, in commemoration of certain days of humiliation and national misfortune viz., the 17th of the fourth month (Tamus), as the anniversary of the taking of Jerusalem both by Nebuchadnezzar and Titus; the 3d of the seventh month (Tishri), when Ishmael had killed Gedaliah, the Jewish governor appointed by the Babylonians (Jer. xli. 2); the 10th of the tenth month (Tebeth), in remembrance of the siege of Nebuchadnezzar; the 13th of the twelfth month (Adar), the fast of Esther, and the day most rigorously kept, next to the great Day of Atonement:—the 9th of the fifth month (Ab), the anniversary of the destruction of the first temple by Nebuchadnezzar, and of the second by Titus. That the people had at all times been prone to attach great importance to the use of this penance as a visible sign of outward contrition, is clear from that ordinance of the Mosaic law which puts into the hands of the head of a family the power of confining self-imposed vows of abstinence within due limits. The community loved to express their penitence for sin, or their grief on the death of great men, by occasional fastings. They were also considered an efficient means of averting the divine wrath, of insuring victory over an enemy, or of bringing down rain from heaven. Besides, fasting was not unfrequently resorted to by those who wished to free their minds from all hindrances to meditation, as in the forty days of Moses (Exod. xxxiv. 28), or the fast of Daniel (Daniel, x. 2 and 3). This fast of Contemplation, as it might be called, seems also to have been the model imitated by the Cabbalists, some of whom are known to have fasted from Sabbath to Sabbath. In later times, when, after the destruction of the temple, sacrifices had ceased, fasting, as causing a decrease in the flesh and fat of the individual, was considered to be in some degree a substitute for the animal which had formerly been offered up by the priest. From a means to repentance and inward purification, which purpose alone it had been originally intended to serve, it became an end and a virtue in itself; an abuse, indeed, neither unknown nor undenounced even in the days of the prophets. If we add to this the endless chain of dire calamities and ever renewed persecutions of which the Jews have been the victims for many a long century, the ever-increasing number of their fasts commemorative of deaths and tribulations will be far from surprising. Most of these, however, which were superadded from time to time, soon fell into oblivion. Over and above the six already mentioned, but few entire days are now observed by the orthodox, and these merely of a local character. Fasting, with the Jews, always implies entire abstinence, and lasts, except on the Day of Atonement and the 9th of Ab - when the sunset of the previous evening is the sign for its commencement - from the break of the day to the appearance of the first three stars.

Sackcloth and ashes, the garb of the penitent in ancient times, are no longer worn; but as the special holiness of the Day of Atonement is celebrated by various solemnities (see FESTIVALS), so the deepest mourning over the loss of temple and country is visibly expressed by many ceremonies in the Jewish synagogues and homes on the 9th of Ab. On that day also, to add the individual to the national sorrow, the cemeteries are generally visited. Of several half-days of fasting that have survived, we will mention the first two Mondays and the first Thursday in the second month (Iyar) and in the eighth month (Cheshwan), (sheni va-hamishi vesheni), in celebration of the two meeting-points of summer and winter; as also, several days before the New-year or Day of Judgment, and before the Day of Atonement. The individual is bound to celebrate by fasting the anniversary of the death of his parents, his own wedding-day until the performance of the marriage-ceremony, and the birth of his first-born male child (up to its thirteenth year when the duty falls upon the latter himself), on the day preceding the Pesach (Pasha)

—in commemoration of the sparing of the Israelite first-born in Egypt. For the several hours' fasts on the two New-years' Days, and on the first six days of the Feast of Tabernacles, we refer likewise to FESTIVALS, and we will only add in conclusion, that the Sabbath causes the postponement of any fast—that of the Day of Atonement only excepted—which may happen to be coincident with it; and that children—girls up to their twelfth, boys to their thirteenth year—pregnant women, and the sick, are exempted from the observance.

In the time of Christ, fasting, as we have seen, was held in high estimation. The Mondays and Thursdays—the market-days, on which the judges sat, and the law was read in the synagogues—were especially set aside for this purpose by the Pharisees. The Essenes fasted even more frequently. The Sadducees alone took exception to this rite, and were therefore considered ungodly. Christ himself neither approved nor disapproved of the custom, but, as in all matters of ceremony, allowed his disciples, Jews and Gentiles, to act according or contrary to their old habits. He is distinctly against such a *commandment*, and even excuses those who did not fast. His own abstinence from food for forty days was like that of Moses, entirely an individual act; and against a voluntary and limited imitation of such abstinence, to which the spirit might move a man, no objection whatever was to be taken.* During the first centuries of Christianity, these voluntary fasts were frequent enough: the new converts adhering in most cases to their old rite, and only taking care to change the days, which had been days of abstinence in their former religions, for others. Besides, they were considered a befitting preparation for holy acts and feasts, for ordination and baptism. The time mostly celebrated annually in common by all were the forty hours from Friday afternoon to Sunday morning, during which time Christ lay in the sepulchre. But not before the end of the second century was anything like an ordinance promulgated with respect to fasting in the new religion. It was first Montanus who, as the Paraclete, introduced, among other laws of excessive severity and rigour, fasting, as an inhibition upon the faithful. The Wednesdays and Fridays, as the days when Christ was taken prisoner and crucified, were made days of strictest abstinence from all food; while on the other days of the week, dried, uncooked victuals only were allowed. Asceticism and monachism had their share in the gradual development of the doctrine of the necessity of mortifying the flesh, and as a natural consequence, in the growth and diffusion of the custom of fasting. Yet, in the first six centuries, the difference in the various Christian communities was not greater in any other doctrine or cer than in this. Bishops and councils, howe ally fixed the times and seasons for the Christendom. The 40 hours had gradually 40 days, called the Quadragesima; and the of Orleans, in 541, made it binding upon Christian not to eat any meat during this save only on the Sundays.* The eighth cou Toledo, in the 7th c., declared those who at during Lent, sinners unworthy to partake resurrection. From the 8th c. to the 11th, gradual reaction set in, the laws of fasting a punishments awarded to the transgressors stricter and stricter; interdict and exc cation were among the penalties. By degr had become so numerous and different in kin they were divided into—1. Jejunium gen fast binding for all); 2. Consuetudinari fast, &c.); 3. Penitentiale (atonement for gressions); 4. Votivum (consequent upon a 5. Voluntare (for the better carrying out undertaking). These, again, were kept eit 1. Jejunium naturale (an entire abstinence food or drink, especially in preparation f reception of the Eucharist); 2. Abstinentia food only being allowed, but several times a 3. Jejunium cum abstinentia (the same fo which must be taken once a day only 4. Jejunium sine abstinentia (all kinds of fo only once a day). The food prohibited on fast-days included, during certain periods, the flesh of quadrupeds, fowl, and fish, the 'lacticinia'—i.e., all that comes fr ruped and bird, as butter, eggs, milk, cannot here enter into detail; the discrepanc differences of opinion with respect to the modes of fasting, or to the food prohibit even among successive popes and cont bishops and elders of the church, so and involved in such obscurities, that the historians themselves shrink from enum them. Suffice it to say, that they g developed in the Roman Church into—1. fasts, of which Friday, as the day of the cruc seems to have been early and generally ob To this was added the Wednesday, as the which the death of Christ was resolved These two days received the name of Stat term borrowed from the *stationes* of the soldiers, in accordance with the views held ascetics and monks, that they were the wa Christ. At a synod in Spain in the begin the 4th c., the Saturday was superadded, innovation met with great opposition, esp in the East, where Jewish notions regardi Sabbath had obtained a more permanent tion. 2. Vigils, originally night-services ob by the first Christians on the eve of Sunda festivals, partly in imitation of the Jewish of celebrating the entrance of the sabbath festivals on the evening of the previous da partly in fear of the danger to which a service in the daytime would have exposed the early converts. Although these night-services became unnecessary in the course of time, they were still continued up to the 4th c., when, owing to the abuses to which they led, they were abolished, or rather transformed into fast-days, kept on the eve of great festivals in honour of Christ, Mary, Saints and Apostles. 3. The great or 40 days' fast (Quadragesimal fast), the most important and most rigorously enforced of all. The 40 hours of fast, in commemoration of the 40 hours during which Christ's body lay in the tomb, gradually expanded to 36, or rather 40 days, as mentioned before, in pious allusion to the 40 days of Moses, Elijah, Christ, the 40 years' sojourn in the desert, or the 40 camps—all considered typical, and the fasting became severer the nearer Passion-week itself approached, in which many other signs of mourning and contrition were generally exhibited. 4. The Quatember fasts on the Wednesdays, Fridays, and Saturdays in one week of each season, in imitation of the four Jewish fasts in the 4th, 5th, 7th, and 10th month. There were still many other fasts, such as those of ordination, &c., but as they had only a temporary existence, we cannot treat of them here. Nor can we enter into the various dispensations granted by the church, or the special pastoral letters generally issued before Quadragesima, nor into the variations in the observance of fasts and fasting in our own days; we can only add, that they have in a great measure lost their former severity, and that only partial abstinence is the rule in all cases. The opinion held by the church in former days, that fasting is meritorious, and conducive to the salvation of the soul, has undergone no change.

---

* Roman Catholics, however, maintain that all the words of our Lord, which to Protestants appear to discountenance the obligation of fasting, are directed exclusively against the ostentatious and self-reliant fasts of the Pharisees. They even understand the language which he used in condemning the practice of the Pharisee fasters, as containing a direct exhortation to his own disciples—not that they should abstain from fasting—that they should fast with suitable dispositions. They hold, moreover, that in exempting his disciples from fasting, he had regard only to the actual time of his own presence among them. It was incongruous, he said, that the children of the marriage should fast as long as the bridegroom was with them; but, he added, 'the days will come when the bridegroom shall be taken away from them; *and then they shall fast in those days*' (Mark iii. 20; Matt. ix. 15). Hence they infer, that from the time of our Lord's ascension the practice of fasting became obligatory on his disciples, the temporary cause of the exemption hitherto existing having ceased.

* It is only just to add, however, that Catholics dissent strongly from the Protestant this history. They admit that the followers of nus did introduce greater rigour and frequen their fasts; but they deny that before the Montanus the practice of fasting was not fully nised in the Christian Church, and regarded as obligatory. The very earliest allusions to the days' fast of Lent (*tessaracosté*) regard it as an lished and recognised institution. The very fathers who allude to it, speak of it as 'handed and observed by the church;' and so far is its from being ascribable to the influence of Mont that, on the contrary, the earliest relaxations the church admitted were a reaction ag excessive and intolerable rigour of that fanati

With respect to the Greek Church, we have to observe that fasting was and is kept with much ater severity, the non-observance of it being the venial of sins. The days here extend over three-quarters of the year. The principal e the Wednesday and Friday—with a few ptions—throughout the whole year; the great ter fast, lasting 48 days; that of Christmas, lays; that in honour of the Virgin, 14 days; and s of the Apostles, beginning on Monday after r, and extending to the 29th of June. Besides ller fasts of preparation, which corre- nd vigils of the Roman Church, they have ny more occasional fasts, which we, however, st omit here.

The Church of England considers fasting a praiseworthy, but by no means obligatory custom. According to Hook's *Church Dictionary*, the distinction between the Protestant and the Roman Catholic view of fasting consists in this, that the man Catholic regards the use of fasting as an erative means of grace, the Protestant only as a ual exercise preparatory for the means of grace. In proof how much the Church of England has left the question of fasting to the conscience and discretion of her members, it may be observed that she s neither defined the mode or degree of fasting, r anywhere given a positive command to fast. has been remarked that no bishop of the Church England has in an episcopal charge laid down as a positive requirement. The days named e English Church as seasons of fasting or nce, are the forty days of Lent (q. v.), includ- Wednesday and Good Friday; the Ember) days; the three Rogation (q. v.) days, and the Fridays in the year (except Christmas Day) he eves or vigils of certain festivals.

Scottish almanacs contain lists of the *fast-days* of all the principal places in Scotland. These are generally one in each year, appointed by the kirk-session of the Established Church of the parish, or by concurrence of kirk-sessions in towns, but generally by use and wont fixed as to their date. The fast-day is always some day of the week preceding the *Communion Sunday*, or Sunday set apart in the Presbyterian churches for the dispensation of the Lord's Supper. It is usually appointed as a day for 'fasting, humiliation, and prayer.' Business is generally suspended, shops shut as on a Sunday, and churches opened for public worship. By an act of parliament passed not many years since, factories are prohibited from carrying on work on the parish fast-day, but in consequence of the ecclesiastical divisions in Scotland, it has become more common than it once was for agricultural and other kinds of work to be carried on. The fast-day of a large town is always a busy day on the railways, many taking advantage of it for excursions, and making it a day of amusement; too many, also, a day of dissipation and revelry. That it is right to keep up the annual fast-day in these circumstances is doubted by many who themselves conform to its religious observance, although of that observance *fasting* does not now generally form a part. Many, however, doubt if it ever was a good institution; alleging that it is inconsistent with the frequent celebration of the Lord's Supper, which they deem right and desirable, and to which there is a growing tendency. The Scottish Reformers, as appears from the *First Book of Discipline*, contemplated the ordinary celebration of the Lord's Supper at least once a month; and the fast-day, as it now exists in Scotland, derives its origin from a later period.

A few words remain to be said of the Mohammedan fasts. Islam, as an offspring of Judaism and Christianity, adopted this custom with many others from both churches. During the whole month of Ramadan, in which the Prophet brought the Koran from heaven, eating, drinking, smoking, smelling perfumes, &c., are strictly forbidden from daybreak till sunset; for the intervening nights, however, all these restrictions are removed. There are, besides, many voluntary fasts, expiatory like the 10th of Moharram, corresponding to the Jewish Day of Atonement, or for the averting of the Divine wrath in sudden calamities, or as an indemnification for the omission of certain pious acts, as the pilgrimage, &c. See JEWS, MOHAMMEDANISM, MONKS.

Besides the *Bible*, *Schulchan Aruch*, *Koran*, and the Fathers generally, we refer to the following authorities on this subject: Bingham, *Orig.* vol. ix. 1. 21; Fabricius, *Bibliogr. Antiquaria*, c. 11; J. A. Muratori, *De Quatuor Temporum Jejuniis*, &c.; J. Dalleus, *De Jejuniis et Quadragesima*, 1654; Schöne's *Geschichtsforschungen*, Th. 1; *Briefe über d. Gottesd. d. morgenl. Kirche*, von Dr E. v. Muralt (Leip. 1838); Siegel, *Altchristl. Alterthümer*; Daniel, *De Jure Tempor. Quadrages.*, 1617; Walch, *De Jejunio Quadragesimali* (Jenæ, 1727); Homberg, *De Quadragesima Veterum Christianorum et ritibus in ea quondam usitatis diss. qua etiam de recentior. Papist., Græc., Russ., Syrian., Georgian., Maronit., Jacobit., &c. disseritur* (Helmst. 1677).

Fasting, or deprivation of food, is, in a physiological sense, a state inconsistent with the continuance of life in most warm-blooded animals more than a few weeks. If water is not supplied, the period is much shorter, being in man commonly not more than a very few days, or at most a week. Persons have been found in coal-pits and mines, and in other situations where access to food has been impossible, but where water could be had, as long as six weeks after their seclusion, still alive, though of course in a very feeble condition; and a very small daily allowance of food has supported life [illegible] appearan

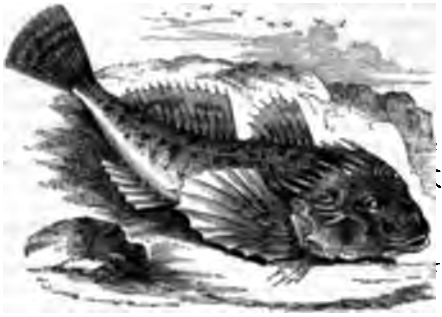
HER-LASHER (*Cottus bubalis*), a very
h on the British coasts, the most spiny
tish species of *Cottus* (q. v.), and parti-
armed with strong spines on the back of the head—which is large—and on the gill-covers. When touched, it distends its gill-covers, sets out its spines, and assumes a very threatening appearance.



Father-Lasher (*Cottus bubalis*).

Its general aspect is indeed forbidding, and even the little boys who angle from the rocks and pier-heads are usually averse to touch it, although it is said to be wholesome and agreeable food. It is of a brown colour above, whitish beneath, curiously marbled and spotted, the fins marbled black and white. In Scotland, it bears the name of *Lucky Proach.*

FATHERS OF THE CHURCH (*Patres Ecclesiastici*), certain early writers of the Christian Church. The term Abba, Græcised ἀββᾶς (Father), in use among the Talmudists as a synonym of Rabbi (my master), and constituting, according to Maimonides, the third or lowest honorary title of a Doctor of the Divine Law, was in the first centuries of Christianity applied indiscriminately to all theological writers who were distinguished by their learning, genius, or piety. Gradually, however, the word Father, or, more fully, Father of the Church, was confined to those teachers whose writings were considered pre-eminently orthodox, and who might be looked upon as the *progenitors*, as it were, of certain dogmas, upon the development of which they had exercised a more or less direct influence; while those writers who diverged into the fields of heretical opinion were called simply *Scriptores Ecclesiastici* (Church-writers). Out of the number of the former, some few master-minds, to whom the church owed a still greater tribute, were again singled out as *Doctores Ecclesiæ* (Doctors of the Church), which title of pre-eminence, however, is bestowed on many writers who lived subsequently to the time of the Fathers, in consideration of their 'purer and more excellent doctrine' (Benedict, xiv., *Bulla, Milit. Eccles.*).

The temporal limits within which the Fathers are to be confined, as well as their proper share of authority in matters of faith, have long been points of grave discussion. While some include the Fathers of the 1st c., generally called the Apostolical Fathers, on account of their being the contemporaries or disciples of Christ and the apostles, they are excluded by others; again, by some, the 7th c. is made the closing period, while others carry the list down to the 12th, or even the 13th century.

With respect to the authority of the Fathers, some, like Fredegis, held their words to be as sacred as those of the prophets and sacred writers; while others, like Alphonso di Castro, Melelius Cano, and Cardinal Cajetan, ridiculed the notion that Symmachus should be made equal to St Paul, or Didymus to St John the Evangelist. Others, again, like Pope Gregory and the majority of writers, took the middle course of regarding them not as infallible, much less as prophets and apostles, but held, that when in matters of faith the most perfect and unswerving unanimity reigns among them, then, and then only, the Holy Ghost is to be considered to speak through them. See TRADITION.

Immense as is the range and variety of their writings, ascetic, apologetic, polemical, exegetical, moral, historical, or dogmatical, so also is the diversity of their individual value. Nothing can be further from historical justice than either the wholesale laudation or condemnation of these writers as a body; but whatever stand we may take, we cannot but see that they are of the utmost moment. Stretching as they do over the entire extent of that period which forms the turning-point between the antique and modern world, they faithfully and often unconsciously portray that awful change, of which they were in no small degree the instruments—the gradual wane of old faiths, and of an old civilisation, and the slow and struggling rise of that which was to replace them; while they preserve the most minute and trifling details with the same accuracy as the most momentous event, as each happened to bear upon their subject. The philosopher, the historian, the antiquary, each and all will find their writings, as a whole, to contain an inexhaustible fund of instruction. Of no less interest, perhaps, are their works in relation to the writers individually. These, issuing from all parts of the then known world, from all ranks, all creeds, could not but impress the stamp of their nationality and callings, besides that of their youth or age, vigour or feebleness, upon their writing—Jew, Greek, Roman, African, Spaniard—orator, poet, lawyer, statesman, priest, they all bring with them that which was their own before they embraced the new faith: their dialectic power, their fantastic poetry, their graceful speech, their stern austerity. What Greek subtlety did theoretically for the development of dogma in Origen and Athanasius, that Roman thoroughness did practically for the erection of the hierarchy in Leo the Great and Gregory III.; while from Egypt came asceticism and monachism, the ascendency of spiritualism over sensualism is owing to those who came from the northern coast of Africa. How far Platonism, and especially neo-Platonism, Aristotle and Greek philosophy generally, are found developed in these works, and infused into the new faith by the former teachers of the academies themselves, who mostly retained their old philosophical garb, upon this, as well as upon many other points, we must forbear to enlarge.

We will now proceed to take a brief survey of these writers—referring for further information to the special articles on the more eminent among them. According to the now generally adopted method of dating them from the 1st to the 7th c., they are divided into two distinct periods, the first of which goes down to the Council of Nicæa, 325 A.D. Of those who head the list, the Apostolic Fathers—so called from their supposed connection with Christ and the apostles—very little need be said, as their writings, which are mostly of an ascetical character, have come down to us in a corrupt and mutilated state, and as the writers themselves owe their chief celebrity to the times in which they happened to live. We have here Barnabas, the son of Teostes, and the companion of St Paul (Acts ix. 27; xii. 25); Clement, supposed to have been the third Bishop of Rome; and the Clement mentioned by St Paul (Philipp. iv. 3); Hermas, identical perhaps with the Hermas of St Paul's Epistle to the Romans (xvi. 14); Ignatius, Bishop of Antioch; Polycarp, Bishop of Smyrna; Papias; Dionysius the Areopagite, &c. Next follow the Apologists, or those Fathers whose chief aim was the defence of the new faith against the Roman state, and non-Christian authors, and who were the first to make their scientific culture, and more especially the Platonic philosophy, subservient to Christianity, for this purpose: Quadratus the 'Evangelist,' a travelling missionary; Aristides, an Athenian philosopher; Justin Martyr, the well-known author of the two Apologies and the Dialogue with Trypho (or rather Tarphon); Tatian of Assyria, who, having examined the different forms of worship, as well as the systems of philosophy prevalent in his time, felt satisfied with none but Christianity, and became a disciple of Justin, and a vindicator of the philosophy of the barbarians; Athenagoras, who addressed his Apology to the Emperor Marcus Aurelius, and his son Commodus, and wrote a Defence of the Doctrine of the Resurrection; Theophilus, Bishop of Antioch; Miltiades, &c. Next come the Church Fathers of Asia Minor, men of more practical and peaceful tendencies: Hegesippus, perhaps an Ebionite; Irenæus, Bishop of Lyon and Vienne, who wrote a refutation of the Gnostic system; Hippolytus, his disciple, of unknown birthplace and renowned name. In the North African Church, the development of which is of the utmost moment, inasmuch as its language, dogmas, and laws were adopted by the greater part of the Christian world in the West, we find Tertullian of Carthage, the rhetorician and advocate, a man of profound mind and vast influence; Cyprian, the author of the *Testimonia* in favour of Christ; Commodian, the writer of the *Rules of Living;* and Arnobius, a rhetorician of Sicca, in Numidia. The first comparatively barren, though otherwise highly important church, is the Roman. The pre-eminently practical Roman mind looked more to the outward growth and wellbeing of the church than to literary excellence, and thus we have only two distinguished authors to be noticed here—the Presbyter Caius, known as an opponent of the Montanists; and the Presbyter Novatian, who wrote a treatise on the Jewish laws respecting food. The church which, more than any other, endeavoured to combine speculation with faith, and which gradually became, through its high degree of culture and erudition, the very centre of Christianity, is the Alexandrian. And here we have Pantænus; Clement the Alexandrine, chiefly known by his Stromata or Elements of the Gnosis; Origen, called Adamantinus, the eminent Neo-Platonist, born 185 A.D., in Alexandria, one of the most influential writers of the whole Christian Church; Herculas, with his disciple Dionysius, a liberal and moderate man; Gregory, the worker of miracles; Pamphilus and Julius Africanus, the first Christian chorographer.

In the second period, which dates from the Nicæan Council, and comes down to Gregory II. 604 A.D., a period altogether superior, on account of the great number of intellectual and erudite men who devoted their lives and labours to the church, we have to distinguish the Greek from the Latin Fathers. Among the former, we have again to draw a line between those of the Alexandrian school—like Eusebius Pamphili, the Herodotus of the church; Athanasius, the father of orthodoxy; Basil the Great, Doctor Ecclesiæ, and his brother Gregory of Nyssa; Gregory of Nazianzen, called the Theologian, by way of eminence; Didymus; and Cyrillus, some time Patriarch of Alexandria, the chief prosecutor of Nestorius—and those of the Antiochian school, where we find Ephræm Syrus, 'the prophet of the Syrians;' Cyril of Jerusalem, the converted Arian; John Chrysostom, of brilliant eloquence; Diodorus, Bishop of Tarsus, one of the chief founders of the Antiochian school; and Theodoretus, Bishop of Cyrus. Besides these, we find, of Greek Fathers who belonged to neither school—Epiphanius, the violent adversary of Origen;

Socrates Scholasticus, the continuator of Eusebius's *Ecclesiastical History*; Philostorgius, an Arian Church historian; Sozomenus; Evagrius; Macarius the Elder, chiefly known through his miracles and combats with the devil; Procopius of Gaza, the rhetorician; and Joannes Scholasticus, famous through his collections of canonical law. Among the Latins, we have to enumerate first the African Fathers: Fabius Victorinus; Augustine of Tagaste in Numidia, the greatest dogmatist of the Western Church; Pope Gelasius I. (492—496), who finally fixed the canon of the Bible for the Roman Church; and the Bishops Fulgentius, Junilius, and Facundus. Of Spaniards, we have Prudentius the poet; Paulus Orosius, whom Augustine used as his messenger to the East in his controversies with Pelagius. Of Gauls there are Hilarius Pictaviensis, Bishop of Poitiers about 350, the Athanasius of the West; Paulinus of Nola; Sulpitius Severus, friend of Martin of Tours; Vincent of Lerins, once a soldier, who wrote under the name of Peregrinus; Sidonius Apollinaris, Bishop of Clermont; Gennadius, the author of an ecclesiastical literary history; Ennodius from Arles, who exerted himself to unite the Eastern and the Western Church; and Gregorius Turonensis, who wrote *Historia Ecclesiastica Francorum*, the basis of Frankish history. From other countries we have Sedulius, an Irishman; Joannes Cassianus, a Scythian; and Mercator, of unknown birthplace. We conclude with the Italians themselves: Lactantius Firmianus, the Christian Cicero; Julius Firmicus Maternus of Sicily; Ambrose, Metropolite of Milan, who raised his see to such a power that it dared to resist Rome herself up to the 12th century; Rufinus of Aquileia, defender of Origen against the charge of heresy brought against him in the West; Eusebius Hieronymus, undoubtedly the most learned of all the Latin Fathers, and who mastered also the Greek and Hebrew languages, collected in Palestine the most valuable notes for the elucidation of the Scriptures, and also corrected the Latin edition of the Vulgate; Pope Leo I.; Boethius; Aurelius Cassiodorus, whose *Historia Tripartita*, in twelve books, served for a thousand years as a compendium of ecclesiastical history; the two poets, Arator and Venantius Fortunatus; and Pope Gregory I. (590–604), is regarded by Protestants as having first given the Western Church its peculiarly Roman Catholic stamp by developing the idea of the Eucharist into a Theophany, and making it the centre of the worship. His works, especially his letters, are invaluable for the study of his own times, especially for the history of the conversion of the West.

On the MSS. of the Fathers, we refer to *Petri Lambecii Commentarii de Bibliotheca Cæsarea Vindobonensi*. The editions of the works of the Fathers are of two classes: those of the individual Fathers, whose writings are the most voluminous and of highest dogmatical importance, and the general Patristic collections, which comprise the writings of the less voluminous or minor Fathers. In the former class, the first place, beyond all dispute, belongs to the celebrated Benedictine editions, by the members of the great Maurist congregation of the French Benedictine order (see Benedictines), of which community the task of editing the Fathers came to be considered as the recognised work. The Benedictine editions of the greater Fathers, with the exception of two or three, still maintain the very highest place in the estimation of the learned. Of the collections of the works of the Fathers (which, for the most part, consist of writers not published separately), the most important are those of La Bigne, Galland, Rösler, Walch, Zimmerman, and Migne, the last still in progress. Cardinal Mai has also made considerable additions to the Patristic collections in his *Bibliotheca Patrum*, *Spicilegium Romanum*, and *Classici Auctores*, as have the Benedictines of Solesme in the *Spicilegium Solesmense*.

FATHOM, a measure of six feet, principally used in reference to marine soundings, and in mines. Originally, a fathom was taken as the width to which the two outstretched arms extended.

FATIMIDES, or **FATIMITES**, the name of an Arabian dynasty which reigned for nearly two centuries over Egypt. Its founder was Mahadi-Obaidallah, who flourished from 910 to 934 A.D. He asserted that he was descended from Fatima, the daughter of the Prophet, and Ismael, a grandson of Ali. He thus won over to his side all the adherents of the widely diffused Ismaelites, an extravagantly schismatic sect of Mohammedans in Africa, and overthrew the race of the Aghlabides, who ruled at Tunis. His successor extended his dominion as far as Fez, and his descendant, Moezz, in the year 970, conquered Egypt, expelled the reigning family, removed his court thither, founded Cairo, assumed the title of Calif, thus proclaiming himself the lawful successor of the Prophet, and subdued Syria and Palestine. After the death of Moëzz, the F. maintained their high position for some time; but gradually degenerated, and resigned all the cares of government into the hands of their viziers. Their power now rapidly declined, and their vast territories melted away. In religious matters, the F., because they were raised to power by the followers of Ali, took upon themselves the protection of the Shiite sect, and the establishment of the Ismaelitic doctrines. Between the years 1002–1021, the Calif Hakem-Biamr-Allah persecuted the orthodox Mohammedans or Sunnites, as well as Jews and Christians. He founded an academy at Cairo, and endowed it largely, but connected with it a secret society for the diffusion of Ismaelitic opinions. In the first stages, the novice was shewn the untenable nature of the precepts of the Koran; in the sixth, the advanced student found that religious legislation must give way to the claims of philosophy; in the seventh, a mystic pantheism was proved to be the true philosophy; and finally, in the ninth, the initiated discovered that he was not required to believe anything, and might do whatever he pleased. His system, with considerable modifications, found a home among that peculiar people the Druses (q. v.). After the death of Adhid, the last of the F., in 1171, the founder of the dynasty of the Ayubides, Salah-ed-din (Saladin), took possession of Egypt.

FATS are those oily substances which are solid at ordinary temperature. They do not differ essentially from the liquid oils. See Oils.

FATS, Animal. There is considerable difference of opinion amongst chemists regarding the exact nature of the fats occurring in the animal body. According to most chemists, they are composed of an admixture of three separate fats—margarine, stearine, and oleine, of which the two former are solid, and the latter fluid, at ordinary temperatures. Heintz, who has carefully studied these bodies, declares, however, that margarine is not a simple fat, but a mixture of stearine and palmitine (a solid fat occurring in palm-oil); and he considers human fat to be a mixture of stearine, palmitine, and oleine. For the chemical characters of these substances, we refer to the articles Margarine, Oleine, Palmitine, and Stearine, and we proceed at once to the consideration of the physiological relations of the fat.

Fat, usually enclosed in vesicles, is found very extensively in the animal kingdom. It is abundant in many larvæ, and occurs more scantily in most insecta. It is met with in the mollusca, and is comparatively abundant in all the divisions of the vertebrata. In most fish, it occurs throughout the body, but is especially abundant in the liver, where it is found in the hepatic cells, and not in its own characteristic vesicles. In reptiles, it exists chiefly in the abdomen. In birds, we especially find it about the peritoneum, and under the skin. In mammals, it is very generally diffused, but the greatest quantity is under the skin, in the omentum, and round the kidneys.

The quantity of fat in the human body varies considerably at different periods of life. In the earlier stages of fœtal existence, we find scarcely any fat; in new-born children, there is usually a considerable quantity of this substance deposited under the skin, and the organism continues rich in fat till the age of puberty, when a marked diminution of the substance occurs. It again increases about middle life, and then occasionally occurs in great excess; for example, three or four inches of fat are not unfrequently found under the skin of the abdomen in corpulent persons.

Extraordinary deposits of fat in some particular part of the body are observed in certain races of men and animals. One of the most remarkable examples of this peculiarity is afforded by the Hottentot women, in whom the fat accumulates in the gluteal region to such an extent as to give a most remarkable prominence to that part of the body; and a somewhat analogous deposit exists in a variety of sheep (*Ovis steatopyga*, the fat-buttocked sheep), in which a large mass of fat, sometimes attaining a weight of forty pounds, is developed on the buttocks, and takes the place of a tail.

The origin of the fat in the animal body must undoubtedly be chiefly referred to the fat taken with the food. It has, however, been proved by the most careful investigations on various animals subjected to the process of fattening, on bees fed with pure sugar, or with honey containing scarcely any wax, and on the larvæ of the insects inhabiting galls, that the animal, like the vegetable organism, has the power of forming or producing fat, far more being found, in these experiments, in the body of the animal than could be referred to the fat existing in the food. The excess must therefore have been formed either from the non-nitrogenous portion of the food, such as starch and sugar; or from the nitrogenous matters, such as fibrin, albumen, &c. In the case of the bees, it was distinctly proved [illegible] sugar, while in the case [illegible] geese, it was similarly [illegible] from the starch which [illegible] on which the animal [illegible] have no corresponding evidence of [illegible] fibrin, albumen, &c., into fat [illegible] conversion is by no means improbable [illegible] regard the non-nitrogenous [illegible] as the chief fat formers next to [illegible]

The [illegible] value of the fats is due partly [illegible] physical, and partly to their chemical characters.

The [illegible] deposited beneath the skin [illegible] the body from external shocks [illegible] of pressure through the whole [illegible], and, moreover, to keep up the [illegible] of the body by materially checking, through its very slight conducting power, the loss of free heat by radiation. This use of the fat is most [illegible] in some of the lower animals (the seal, whale, &c.), which are exposed to very low temperatures.

Another physical use of fat is to promote the mobility of various organs. Hence, in cases of extreme emaciation, it always remains in the parts where motion is most essential, as the heart, and the orbit of the eye.

Another of its important physical properties is that of rendering other bodies supple, and diminishing their brittleness. In this point of view, the use of fat is very conspicuous in the bones.

The chief chemical use of the fat is its power of exciting and supporting the animal heat. In the oxidation of the fats in the animal organism, whether the process be gradual or rapid, a large amount of heat must necessarily be liberated; and that they are oxidised, and for the most part reduced to carbonic acid and water, is evident, because they neither appear in any quantity in the excretions, nor, as a general rule, accumulate beyond a certain point in the organism. An accumulation of fat thus serves as a reservoir of combustible matter in time of need. This is especially evident in the case of hybernating mammals, as, for example, hedgehogs, in which an enormous quantity is deposited just before the hybernating period: during this period, it gradually disappears, its carbon being slowly consumed in the respiratory process, and keeping up the animal heat.

Fat is, moreover, one of the most active agents in the metamorphosis of animal matter. Lehmann ascertained that a certain, although a small quantity of fat was indispensable to the complete gastric digestion of nitrogenous food, a fact which is confirmed by the observation that in experiments on artificial digestion, the solution of substances used as food is considerably accelerated by the presence of a little fat. The occurrence of fat in the milk and in the egg, as also in all highly cellular organs (as, for example, the liver), is a clear indication that this substance plays an important part in the process of cell-formation; and no animal cell or cell-yielding plasma has ever been observed in which fat is not a constituent.

An undue accumulation or increased growth of the fatty tissue gives rise to the condition known as Obesity (q. v.).

FATTY ACIDS. See OILS.

FATUITY, or DEMENTIA, consists in the impairment or extinction of certain mental powers, or of all. Esquirol has quaintly but descriptively said that the idiot and imbecile are poor who have never been rich, but that the fatuous or dements are rich who have been made poor. This impoverishment is sometimes so extreme, and the sufferer is so little influenced by consciousness as to lose a knowledge of his own existence; and so little by impressions through the external senses, and by the instincts of the sensory ganglia, as to be equally ignorant of the existence of others. Life is vegetative merely. This deprivation may be partial or complete. It may appear as a weakening of sensibility. This is not the tolerance of powerful or painful impressions, or indifference to such, springing from abstraction or engrossment of the attention, but positive extinction of perception; or it may present the more common form of enfeeblement of intelligence, of memory; of the will, where the patient is apathetic, passive, plastic. The disease may involve the affections and the moral sense, and abrogate the power of decision, and all spontaneity of action and thought. Incoherence in ideas and words may be made to constitute another form, although generally regarded as a characteristic; whether it amounts merely to forgetfulness, or to confusion or irrationality, to inconsecutiveness and inability to express instincts and wishes. Delusions and hallucinations may co-exist with these conditions, but, like the real impressions received by this class of the insane, they are feeble, fugacious, and uninfluential. Under all these aspects, the essential element is privation of power; and this is met with as a specific mental disease, arising from obvious causes, unassociated with general alienation, acute in its nature, and rapid in its progress. It is most frequently the disease of youth, of the period of puberty, contemporaneous with growth, with debilitating and exhaustive processes, and depending, in all probability, as in the other forms, upon insufficient nutrition of the brain. At this age, the injury is reparable, and what may be designated juvenile dementia, has the rare distinction of being curable. More frequently, it is the sequel of mania, melancholia, and severe affections of the nervous system. The deterioration here arises from actual changes in the nervous structure, which render healthy nutrition impossible; so that, although mitigation, and sometimes to a marvellous extent, is within reach of treatment, recovery is believed to be impracticable. Again, it is an affection of old age; and although senile dementia may seem but an exaggerated state of dotage, it is accompanied by such marked physical changes, as to leave no doubt that it originates in circumstances differing widely from that gradual degeneration of the tissues which is evidenced by the 'second childishness and mere oblivion.' Lastly, this state may follow fever, when it is transitory, and generally of brief duration.

Fatuity is one of the few morbid mental conditions recognised in our legal code, even by name, as relieving from the consequences of criminal acts, and as disqualifying for the administration and disposal of property. Esquirol, *Des Malad. Ment.*, tom. ii. p. 219.

FAUCHER, LEON, a French publicist and statesman, was born at Limoges, 8th September 1803; studied at first philology and archæology, in which branches of knowledge he acquired some reputation; but about the period of the July revolution (1830), betook himself, with genuine enthusiasm, to journalism and political economy. He became successively editor of the *Temps*, the *Constitutionnel*, and the *Courrier Français*. These functions occupied him from 1830 to 1842, during which period he published many articles on questions of political economy. In 1843, he began to write for the *Revue des Deux Mondes* a series of articles on the industrial condition of England. The whole were collected into two volumes, which appeared in 1845, under the title of *Etudes sur l'Angleterre*, and constitute the most weighty and substantial of all his productions, though Englishmen reckon the author greatly in error in many points. At the general elections of 1846, he was elected for the manufacturing city of Rheims, where his opinions on tariffs were highly appreciated. In the Chamber of Deputies, he voted with the dynastic opposition. A ready but by no means brilliant speaker, he came forward as one of the leading advocates of free-trade, and published in the *Siècle*, and in the *Revue des Deux Mondes*, a number of essays on national economy, characterised by their vigorous and spirited argumentation. After the revolution of 1848, he sat both in the Constituent and Legislative Assemblies for the department of Maine. When Louis Napoleon was chosen president, F. became first Minister of Public Works, and subsequently Minister of the Interior; but when the President proposed to appeal to universal suffrage, F. gave in his resignation, and, after the *coup d'état*, he withdrew from political life. F. died 14th December 1854. A large number of his most valuable contributions to the science of politics will be found in the collection of the *Economistes et Publicistes Contemporains*, and in the *Bibliothèque des Sciences Morales et Politiques*.

FAULT, the term in Mining and Geology for any interruption in the continuity of the strata coupled with the displacement of the beds on either side of the line of fracture. See DISLOCATION.

FAUN. Faunus was a mythical personage, an ancient king of Italy, who instructed his subjects in agriculture and the management of flocks, and was afterwards worshipped as the god of fields and of shepherds. The festival of the *Faunalia*, held on the 5th December, referred to the protection he exercised over agriculture and cattle. Fauna was his female complement. He was also worshipped as a prophetic divinity. As deity of the woods and of flocks and herds, he corresponds to the Greek Pan: the idea also arose of a plurality of Fauni or Fauns, like the Greek Satyrs, who were represented as monster deities with short horns, pointed ears, tails, and goats' feet, and to whom all terrifying sounds and appearances were ascribed.

FAUNA, a term employed to designate animals collectively, or those of a particular country, or of a particular geological period. Thus, we speak of the fauna of Great Britain, the recent fauna, the fossil fauna, the fauna of the Eocene period or formation, &c. The term bears the same relation to the animal kingdom that *Flora* does to the vegetable. Its derivation is from the mythological fauns, regarded as the patrons of wild animals. In the fauna of any country are included only those animals which are indigenous to it, and not those which have been introduced.

FAURIEL, CLAUDE CHARLES, a French philologist, historian, and critic, was born at St Etienne, in the department of Loire, 21st October 1772, studied at the College des Oratoriens at Tournon, and afterwards at Lyon, and in 1799 was appointed to a situation under Fouché; but, destitute of all political ambition or predilections, and passionately fond of learned studies, F. resigned his office in 1802, and devoted himself to the calmer pursuits of literature. He made himself familiar with Sanscrit, Arabic, and the treasures of classical antiquity and of the middle ages; and although he did not write much, comparatively speaking, yet the value of what he did write cannot easily be over-estimated. M. Renan may exaggerate when he affirms that F. 'put in circulation the greatest number of ideas' of any contemporary writer; but even the Germans allow that in many points of literary history, criticism, and philology, F. was twenty years in advance of his age. After the July Revolution, he was appointed a professor at the Sorbonne; in 1836, he published his chief work, *Histoire de la Gaule Méridionale sous la Domination des Conquérants Germains* (4 vols., Paris), which is reckoned one of the best specimens of historical investigation and art produced in modern times. Worthy of notice, also, particularly on account of its remarkable historical introduction, is his edition of the Provençal rhymed chronicle, entitled *Histoire de la Croisade contre les Hérétiques Albigeois* (Paris, 1837). F. also contributed several important essays to the literary journals of France, of which, perhaps, the best known was that on the origin of the Epic of Chivalry in the middle ages. He died at Paris, 15th July 1844. Two years after his death appeared a collection of his professorial lectures, under the title of *Histoire de la Poésie Provençale* (3 vols., Paris, 1846), in which F. endeavours, with great erudition and originality of criticism, to shew that to the Provençals must be attributed the composition and primitive development of the greater portion of the romances of chivalry, including those which describe the contests of the Christians and Moors in Spain, and those which form the

Charlemagne cycle, thus finding the origin of the old Spanish and German poetry on the soil of France. F.'s views have, however, met with considerable opposition.

FAUSSE-BRAYE, in Fortification, a low rampart encircling the body of a place, and raised about three feet above the level ground. This work has mostly been discarded by modern engineers, except when used in front of curtains, under the name of *Tenailles* (q. v.). The French engineers gave this title to the work, as an adaptation from the Italian term *Fossa Brea*, which had its origin from the fausse-braye being commonly in the ditch, in front of the main wall. The fausse-braye had the advantage of giving an additional tier of guns for defensive purposes; but the still greater disadvantage of affording facilities for the scaling of the parapet.

FAUSSE RIVIÈRE (in English, *False River*) is a lake of Louisiana, United States, which deserves notice chiefly as an index of the physical character of the country. Till about a century and a half ago, it was a channel of the Mississippi—a fact which probably is still expressed in its name. Here, as in other alluvial formations, the beds of the running waters are undergoing incessant changes.

FAUST, or **FUST**, **JOHANN**, the chief promoter of the invention of printing, a rich citizen of Mayence, died in the year 1460. See GUTENBERG.

FAUST, DR, according to tradition, a celebrated dealer in the black art, frequently confounded with the preceding, was born at Knittlingen, in Würtemberg, or, as some say, at Roda near Weimar. He flourished during the latter half of the 15th and the beginning of the 16th centuries, and is said to have studied magic at Cracow. After having spent a rich inheritance left him by his uncle, F. is alleged to have made use of his 'power' to raise or conjure up the devil, with whom he entered into a contract for twenty-four years, obtaining during that time his fill of earthly pleasure, but at its termination surrendering body and soul into the hands of the Great Enemy. The devil gave him an attendant spirit or demon, called Mephistopheles, though other names are given him by the later traditionists, with whom he travelled about, enjoying life in all its forms, and astonishing people by working wonders, till he was finally carried off by the Evil One, who appeared in terrible guise, between twelve and one o'clock at night, at the village of Rimlich, near Wittenberg, though several other places lay claim to that very questionable honour. Some have doubted, considering the monstrously mythical form in which his career has come down to us, whether such an individual as F. ever existed; but it is now generally believed that there was a basis of fact, on which tradition has built its grotesque superstructure. Gorres, indeed, asserts that one George Sabellicus, who disappeared about the year 1517, is the real F.; but Philip Melanchthon—the man of all the reformers whose word in regard to a matter of fact would most readily be trusted says that he had himself conversed with Dr Faustus. Conrad Gesner (1561) is equally positive; and Luther, in his *Table Talk*, speaks of Dr F. as a man lost beyond all hope. The opinion that prevails, and which is reckoned to be intrinsically the more probable, is that some man of this name, possessed of varied knowledge, may possibly have practised jugglery (for the wandering savans of the middle ages had all a touch of the quack about them), and thus have been taken by the ignorant people for a dealer in the black art, and one who maintained a secret and intimate relation with evil spirits. His widely diffused celebrity not only occasioned the wonders worked by other so-called necromancers of an earlier age—Albertus Magnus, Simon Magus, and Paracelsus—to be attributed to him, but likewise many ancient tales and legends of a marvellous character were gradually transferred to him, till he finally appears as the very hero of magicians. But while, on the one hand, the narrative of F.'s marvels afforded amusement to the people, on the other, they were made use of for instruction by the clergy, who pointed out, in the frightful fate of F., the danger of tampering with the 'black art;' and the abominableness of a life sunk in sensuality and vice. The myth of F. has received a manifold literary treatment. First come the *Volksbücher* (or people's books), which record F.'s enterprises and feats. The oldest of these now known appeared at Frankfort in 1588. Then came an 'improved' edition of the same, by Widmann, entitled *Wahrhaftige Historien von denen gräulichen Sünden Dr Joh. F.'s* (True History of the Horrible Crimes of Dr John F., Hamb. 3 vols., 1599); and in 1695, a work was published at Nürnberg by Pfitzer, based upon that of Widmann. The oldest of these books was translated into all the civilised languages of Europe. Impostors also published books of magic under the name of F., such as *Faust's grosser und gewaltiger Höllenzwang* (Faust's Great and Potent Book of Spells), *Fausten's Miraculkunst* (Faust's Art of Performing Miracles), and *Dreifache Höllenzwang* (The Threefold Book of Spells). These wretched productions are filled throughout with meaningless scrawls and figures, interspersed with texts from the Bible scandalously misapplied: but in the belief of the vulgar, they were supposed capable, when properly understood, of accomplishing prodigies. That the poetical art should in due time have seized on a subject affording so much material for the fancy to work upon, was inevitable; and consequently, German literature abounds in elegies, pantomimes, tragedies, and comedies on Faust. Since the end of the 17th c., the *Puppenspiel* (Puppet-show) of Dr F. (first published at Leipsic in 1850) has been one of the most popular pieces in Germany. It forms the transition from the rude magic tales concerning F., to the later philosophic conception of the Faust-myth, which has become the most perfect poetical expression of the eternal strife between Good and Evil in the soul of man. The first writer who treated the story of F. dramatically was the English writer Christopher Marlowe, about the year 1600 (German translation by W. Müller, Berlin. 1818); but the grandest work on the subject is Goethe's *Faust*, the first part of which appeared under the title of *Dr F., ein Trauerspiel* (Leip. 1790), and afterwards in a remodelled form, under the title of *F., eine Tragödie* (Tübingen, 18[illegible]). The second part was published after the author's death, at Stuttgart in 1833. Besides Goethe's drama, may be mentioned Lessing's masterly fragment, *F. und die Sieben Geister* (F. and the Seven Spirits), G. F. L. Müller's *Dr F.'s Leben* (Dr F.'s Life, Mannh. 1778), and Klinger's *F.'s Leben, Thaten, und Höllenfahrt* (F.'s Life, Doings, and Descent into Hell; Petersb. and Leip. 1791). The plastic art has also found a fit subject in Faust. In Auerbach's cellar at Leipsic, where F. is said to have performed many of his feats, are two rude daubs of the year 15[illegible] representing F. and Mephistopheles riding out of the cellar on a wine-barrel. Rembrandt and Christoph von Sichem have also illustrated the story of F., and, in modern times, Cornelius and Retzsch have done the same. See Peter's *Die Literatur der Faustsage* (The Literature of the Faust Myth), 2d ed. Leip. 1857.

FAUSTINA, mother and daughter. The former, *Annia Galeria*, usually spoken of as *Faustina Senior*, was the wife of the Roman emperor, Antoninus

Pius, and died 141 A.D.; the latter, known as *Faustina Junior*, was married to his successor, Marcus Aurelius Antoninus, and died at a village near Mount Taurus in 175 A.D. Both, but particularly the younger, were notorious for the profligacy of their lives, which their exemplary husbands in vain endeavoured to check. After their deaths, institutions for the relief of poor girls were founded both by Antoninus and Marcus Aurelius in honour of them, and were called '*puellæ alimentariæ Faustinæ*.' Marcus Aurelius, in his Meditations, speaks highly of his wife, and an attempt has been made by Wieland to defend her against the imputations of the historians of the emperors.

FAUSTINUS I., emperor of Haiti, known, before his elevation to the throne, as Faustinus Soulouque, a negro originally of very humble circumstances, was born in St Domingo in 1789. In his earlier years, he acted as servant, and afterwards as adjutant, to General Lamarre. He subsequently served under Presidents Petion and Boyer, and by the latter was raised to the rank of captain. After the year 1844, when the Haitian Republic—of which General Boyer was then president—was dissolved, a struggle for the supreme power ensued, in which F. played an important part. In 1847 he was appointed by the senate President of the Republic. On the 16th April 1848, a dreadful massacre of the mulattoes in Port-au-Prince took place at his instigation. This, and similar measures, struck terror into the hearts of his opponents. In August 1849, he had himself proclaimed Emperor of Haiti, a title which he enjoyed for about ten years; but a revolution having broken out in 1858, and a republic having been declared, F. was forced to abdicate, 15th Jan. 1859. He died 6th Aug. 1867.

FAUVETTE, a French name, partially adopted in the English language, for some of the little song-birds of the family *Sylviadæ* or Warblers, having straight slender bills slightly compressed in front, the ridge of the upper mandible curving a little towards the tip, and the legs not long. They mostly belong to the genus *Curruca*, as the Blackcap, the Pettychaps or Garden Warbler, the Whitethroat, &c.; and to the genus *Salicaria*, as the Sedge Warbler, the Reed Warbler, &c. The Dartford Warbler (*Melizophilus Provincialis*) is also called Fauvette. They are all very lively little birds, continually flitting about in pursuit of insects, mostly frequenting bushy places; and some of them, particularly those of the genus *Salicaria*, preferring watery situations where reeds abound.

FAVA'RA, a town of Sicily, in the south of the island, in the province of Girgenti, and four miles south-east of the town of that name. It has rich sulphur-mines, and a population of 11,400.

FAVART, CHARLES SIMON, a French dramatist, was born at Paris 13th November 1710, and first became known by his *La Chercheuse d'Esprit*, performed in 1741. In 1745, he married Mademoiselle Duronceray, herself a dramatic writer of some note, and a singer of remarkable talent, and in the same year became director of the *Opéra Comique*. The fine taste and judgment of F. and his wife soon obtained for their theatre a great reputation. It was they who made the first attempt to harmonise the costume of the actors and actresses with their impersonations, and to put a stop to the ridiculous practice of decking out soubrettes and country-girls in the attire of court-ladies. So powerful, however, was the opposition excited against them by the jealousy of the other theatres, that the *Opéra Comique* was closed in the first year of its existence. After some time spent with Maréchal de Saxe during his campaign in Flanders, F. and his wife returned to Paris, where the former continued to write operas. His wife died in 1772, and he 12th May 1793. F.'s success as a writer was very great: he may be reckoned the father of the comic opera, and the happy successor of Le Sage, Piron, &c. The number of his pieces amounts to about 60, of which the most celebrated are *Comment l'Esprit vient aux Filles*, *Le Coq du Village*, *Bastien et Bastienne*, *Ninnette à la Cour*, *Les Trois Sultanes*, and *L'Anglais à Bordeaux*. His works have been published several times. An edition in ten volumes was published at Paris in 1810, under the title of *Théâtre de Monsieur et Madame Favart*. A very interesting book, entitled *Les Mémoires et la Correspondance de Favart*, giving delightful glimpses of the literary and theatrical world of the 18th c., was published at Paris in 1809 by his grandson.

FA'VERSHAM, a municipal borough and seaport in the north of Kent, on a navigable creek, opposite Sheppey Isle, 8 miles west-north-west of Canterbury. It chiefly consists of four streets in an irregular cross. It has a valuable oyster-fishery, employing 200 to 300 persons. It sends much agricultural produce to London by hoys. The creek admits vessels of 150 tons. In the vicinity are some of the most important gunpowder factories in the kingdom. Pop. (1871) 7198. Under the name of Favresfield, it was a seat of the Saxon kings, where Athelstan, in 930, held a Witenagemóte. It has the remains of an abbey founded by King Stephen, where he and his queen, Matilda, are buried. St Crispin is said to have been apprenticed to a shoemaker here. Near F. are some chalk caverns, with columns. In 1869, 2567 vessels, of 161,529 tons, entered and cleared the port.

FAVIGNA'NA, the chief of the Ægades, a group of islands in the Mediterranean, off the west coast of Sicily, lies at a distance of six miles from the Sicilian shore, and is about six miles long, with an average breadth of two miles. It has a town of the same name, with two castles, and a population of 3800. F. is fruitful, has good pasturage, and produces excellent wine.

FA'VOSITES, a genus of lamelliferous corals, found in Silurian, Devonian, and Carboniferous strata. They were social corals, closely packed together, no space being left between the walls of the different corallites. As in the other palæozoic corals, the lamellæ are developed in multiples of four, and the older portion of the stony base is partitioned off by horizontal tabulæ.

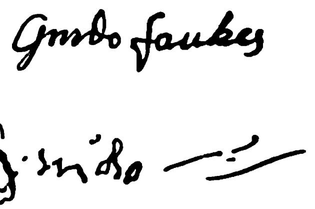
FAVOURS, or **MARRIAGE FAVOURS**, bows of white satin ribbons distributed at marriages in Great Britain, and usually pinned on the breast of all concerned, attendants and postilions included. The favours of those more immediately interested are sometimes enriched with orange blossom. This is an old usage, connected with the love-knot of ancient northern nations: it forms almost the only remaining token of merriment in the nuptial ceremonial, and is, indeed, itself beginning to disappear.—See Brand's *Popular Antiquities*, edited by Ellis, article 'Bride Favours.'

FAVRE, GABRIEL CLAUDE JULES, a French advocate and minister, was born at Lyon, 31st March 1809. He is the son of a merchant, studied for the bar, and passed at Lyon in 1830. His political opinions have always been intensely republican, and when pleading in the course of numerous political lawsuits, F. not unfrequently placed the state solicitors, and even the judges, in a very embarrassing position, by the boldness of his sentiments. As the defender of the *Mutuellists* at Lyon in 1831, he was in danger of losing his life; this, however, did not prevent him from defending those who had been impeached in April, and commencing his speech with *Je suis Républicain.* Since 1834, F. has been a member of the Paris bar. In the February revolution of 1848, he was Home Secretary, in which capacity he wrote the notorious circular for which Ledru-Rollin's administration was so severely reproached, investing the commissioners of the republic with dictatorial authority in the provinces. He was active as a member of the Committee of Foreign Affairs. After the election of the 10th December, F. shewed himself a persistent antagonist of Louis Napoleon, and after the flight of Ledru-Rollin, became the orator of the Mountain. The *coup d'état* closed his political career at this time. He refused to take the oath of fidelity to the imperial government, and betook himself again to his profession. In 1858, he defended Orsini, on his trial for a conspiracy to murder. In the same year, however, he became a member of the Legislature. In September 1870, after the downfall of the empire, he was appointed Minister of War, and carried on negotiations with Count Bismarck. He resigned office in July 1871, and resumed practice at the bar. F. is greatest in political repartee, and though long accustomed to public strife, his language is noted for its Attic elegance.

FA'VUS (Lat. a honeycomb), a disease of the skin, chiefly of the hairy scalp, characterised by yellowish dry incrustations of more or less roundish form, and often cup-shaped, composed of the Sporules and Mycelia (q. v.) of a vegetable growth belonging to the order of Fungi (q. v.). The discs of favus are produced with great rapidity, and spread rapidly, if not attended to at the first, over the whole scalp, destroying the bulbs of the hair, which becomes very short and thin, and then falls out altogether. Favus is a disgusting and unsightly, but hardly a dangerous disorder; it is, beyond doubt, contagious, but only spreads where cleanliness is greatly neglected, and is therefore almost unknown among the better classes. It is far more common among children than among adults, and seems to be more frequent in Scotland than in England, and more frequent also on the continent than in either England or Scotland. The cure is sometimes attempted by a variety of medicated and simple ointments, and by pulling out the hair by the roots, or *epilation*, as it is called; but it seems hardly possible in inveterate cases to get rid of the disease without a very long persistence in habits of the most scrupulous cleanliness, and therefore the cure is seldom permanent, though easily attained for the time. Favus is almost always followed by permanent baldness of the parts affected; unlike Ringworm (q. v.), which is a minor disease of the same order.

The Favus fungus, *Achorion Schœnleinii*, is nearly allied to the fungus which has recently proved so destructive to vines, and has by some botanists been placed in the same genus, *Oidium*.

FAWKES, GUY (properly GUIDO), the head of the conspiracy known by the name of the Gunpowder Plot, was born of a Protestant family in Yorkshire, in the year 1570. He became a Roman Catholic at an early age, and served in the Spanish army in the Netherlands. Inspired with fanatical zeal for his new religion, on his return to England, he entered into a plot with several Catholic gentlemen for blowing up the king, his ministers, and the members of both houses at the opening of parliament, 5th November 1605. Guy F. was taken with the burning match in his hand, tried, and after having been put to the torture, was publicly executed January 31, 1606. In remembrance of this event, in most English towns, but particularly in London, a grotesque figure, stuffed with straw, is carried about the streets on the 5th of November, and finally committed to the flames.



Guido Fawkes
Guido

Guy Fawkes's Signature before and after torture.

A political and religious signification was again imparted to this custom by what was called 'the papal aggression' in the year 1850, when the figure of Cardinal Wiseman (q. v.) was substituted for that of Guy Fawkes.

FA'Y, ANDRÁS, a Hungarian author, was born in 1786, at Kohany, in the county of Zemplén. After having studied philosophy and law at the Protestant college of Sárospatak, F. was called to the bar. He held a situation for some time in the county of Pesth, which, however, he afterwards relinquished, in order to be able to devote himself altogether to literary pursuits. After two volumes of poetry, appeared the collection of Fables (*Mesék*, Vien. 1820), and with the issue of that work F. obtained a decided reputation. The fables are like those of Phædrus and La Fontaine, but in prose. Richness of invention, simplicity of design, and truth of character, are the chief qualities for which the *Mesék* have become a household word among Hungarians. Among F.'s dramatic works may be mentioned the tragedy, The Two Bathorys (*A Két Báthory*, Pesth, 1827); the comedies, Ancient Coins (*Régi Pénzek*), and Hunters in the Matra (*Mátrai Vadászok*). The novel, The House of the Béltekys (*A' Béltekyház*, Pesth, 1832), is rather of a didactic kind, but exhibits many features of Hungarian domestic life. Besides these, F. was a constant contributor to literary and scientific periodicals, and had also his share in some of those pamphlets by which great social questions, as, for instance, female education, savings-banks, &c., were brought to a successful issue in Hungary. In reading F.'s works, we are frequently reminded of Dean Swift. From 1825, which year may be said to have been the beginning of a new political life for Hungary, up to the year 1840, F. was foremost among the leaders of the liberal opposition in the county sittings of Pesth; but on the appearance of Kossuth, the strides of public life growing more and more rapid, F. gradually retired from the region of political controversy, turning his inventive mind to social improvements. The first savings-bank of Hungary (at Pesth) was entirely F.'s work. His literary works were published in eight volumes at Pesth, 1843—1844. He was a directing member of the Hungarian Academy of Sciences. He died in 1864.

FAYA'L, one of the most important of the Azores (q. v.), contains about 37 square miles, and about 25,000 inhabitants. As one must infer from such density of population, the island is fertile. In its centre is a mountain 3000 feet in height; and on its south-east coast a convenient bay with good anchorage. Its principal town, Horta, stands on this bay in lat. 38° 30′ N., and long. 28° 41′ W.

FAYETTEVILLE is the name of a flourishing city of North Carolina, United States of America. Standing on the left bank of the Cape Fear River, about 140 miles from its mouth, F. marks the head of its natural navigation; while, by means of locks and dams, it communicates likewise with the upper basin of the river. While the interior sends down coal, the immediate neighbourhood is covered with forests of pine, which are traversed in all directions by 350 miles of plank-road, and yield not merely timber but tar and turpentine. The Cape Fear, moreover, gives abundance of water-power, which is largely applied to the manufacture of cottons and flour. F. has an arsenal of nearly 50 acres in extent. Pop. (1870) 4660.

FAYÛM, the name of an Egyptian province, surrounded, in the form of a basin, by the Libyan Desert, and connected merely by a narrow valley with that of the Nile, between lat. 29°—30° N., and 30°—31° E. This peculiar depression of the desert extends about 30 miles from north to south, and about 40 miles from east to west, its lowest point lying 100 feet below the banks of the Nile at Benisuef. F. is one of the most fertile provinces in Egypt; producing, in addition to the ordinary useful plants of the country, roses, apricots, figs, vines, olives, &c. in great quantities. This fertility, in a province the soil of which is naturally arid and sandy, is the result of irrigation. A canal from the Nile was, at an early period, carried westward through a gorge in the Libyan hills, which here skirt the western bank of the Nile, and after dividing into numerous branches, lodged its waters in a depression in the north-west, thus forming, it is said, the Lake Mœris (q. v.). The ancient capital of the province, called Krokodilopolis, and at a later period Arsinoë, stood on the eastern shore of Lake Mœris, and upon its ruins stands the present town, Medinet-el-Fayûm, still a place of considerable size, and the chief town of the province.

FEAL AND DIVOT is a Prædial Servitude (q. v.) peculiar to the law of Scotland, in virtue of which the proprietor of the dominant tenement possesses the right of turning up and carrying off turf from the servient tenement for the purpose of building fences, roofing houses, and the like. This, as well as the servitude of fuel, implies the right of using the nearest grounds of the servient tenement on which to lay and dry the Turf Peats (q. v.) or feal. These servitudes do not extend beyond the ordinary uses of the actual occupants of the dominant tenement, and cannot be taken advantage of for such a purpose as to burn limestone for sale. They are not included in the servitude of pasturage, but must be constituted either by express grant, or by possession following on the usual clause of parts and pertinents. Ersk. ii. tit. ix. s. 17. The etymology of these words has been much disputed. *Feal* or *fail* is said to come from the Suio-Gothic *wall*, any grassy part of the surface of the ground; and Jamieson derives divot from *delv* (Sax. *delfan* or *delven*), or, as another alternative, says that it may have been formed by the monkish writers of old charters from *defodere*, to dig the earth. The former is the more probable conjecture.

FEALTY (Lat. *fidelitas*) is the fidelity which a man who holds lands of another owes to him, and contains an engagement to perform the services, or to pay the dues, for which the land is granted. It was embodied in an oath, by which the tenant bound himself on entering to the lands. In taking the oath of fidelity, Littleton says, s. 91, that the tenant shall not kneel, nor shall make such humble reverence as in homage. The only object of fealty in modern times is to keep up the evidence of tenure where no other services are due; but even to this effect it has gone into desuetude.

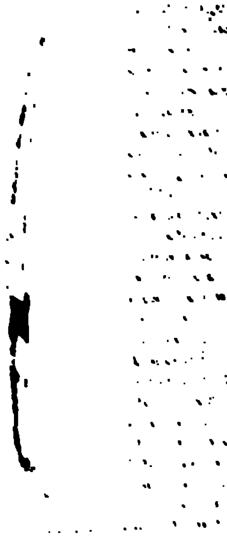
FEAR, MANIA OF, or PANPHOBIA. There are many morbid manifestations of the instinct of cautiousness. Sudden fear in sleep, horrible dreams, nightmare, sleep-walking, have been regarded as symptoms of a special disease. Actual terror from irregular circulation in the sensory ganglia; the sense of falling or drowning in cardiac affections; incubus from disturbance of the circulation in the larger vessels by repletion, plethora, or position, where there is the super-addition of a delusion to the feeling of apprehension—are all allied and distinguished by involuntary and excited cautiousness. It is not only, however, when the intelligence may be supposed to be dormant, and the instincts awake, that such exaggerated fears paralyse minds otherwise sane and sound. Murat, 'the bravest of the brave,' and James I. of England, learned if not wise, were subject to vague, uncontrollable panics, which for a time unmanned them. The condition is often found associated with disease of the heart, as a consequence and concomitant rather than a cause. The presence of the *habitual* dread of evil, the fear of death, the sleepless and breathless anxiety during darkness, or solitude, or silence, as well as the sudden, wild, ungovernable panic, point to the existence of organic or functional diseases of the heart; and conversely, excited or irregular action of the organ, murmurs, angina, lead the astute psychologist to predicate fear as a characteristic of the mental condition. It precedes, and is believed to produce chorea, cancer, and scirrhus. Proximately, however, it depends upon alterations in the capillary circulation, or nervous structure of the brain. Its characteristic is involuntary, irresistible, blind terror, which arises and continues without an adequate cause, and which is not influenced by reason or religion, not even by the removal of the supposed object of alarm. The disease has appeared epidemically during commercial panics, during the horrors of cholera and plague, and in that singular affection called Timoria, which is marked by debility, tremor, and terror, and has been traced to the effects of the damp, unhealthy regions in Sardinia and Sicily, where it exclusively occurs. Panphobia is hereditary, and has been traced through three successive generations. In reviewing the unobtrusive members of an asylum family, the pallid, startled, staring, flickering countenances may be detected as those of patients labouring under fear. They resemble melancholics in pallidity of skin, but in place of courting they shrink from sympathy; though horror-stricken by gloom, they hide in corners, they escape, they shriek in desperation, they climb trees, and apparently inaccessible places; and encounter real in order to elude fancied dangers; or they are motionless, paralysed. They fear and flee from enemies, police, demons, death, punishment; indescribable agonies themselves.—Feuchtersleben, *Principles of Medical Psychology*, p. 281; Arnold, *Observations on Nature, Kinds, Causes, and Prevention of Insanity*, &c., vol. i. p. 257.

FEASTS. See FESTIVALS.

FEATHER, a river of California, and a feeder of the Sacramento, runs through one of the richest gold-fields in the state. It receives the Yuba near Marysville, which appears to mark the head of navigation—the distance down the F. and the Sacramento to the harbour of San Francisco being about 100 miles.

FEATHER GRASS (*Stipa*), a genus of grasses remarkable for the long awns which give a peculiar and very graceful appearance to the species, mostly natives of warm temperate climates. In some of them, the awn is beautifully feathered. This is the case in the best known species, the COMMON F. G. (*S. pennata*), a very doubtful native of Britain, but found on dry hills in the middle and

[illegible] of cultivation [illegible] gardens. When [illegible] the feathery awns—sometimes a foot in length—remain attached, so that [illegible] of F. G. retain their beauty throughout winter, and form one of the most pleasing and [illegible] decorations [illegible]. They are often dyed, to give variety to the decoration, but are never more beautiful than in their natural yellowish-white colour. The feathery awns not only assist in the diffusion of the seed, which is carried by the wind to great distances, but in a very interesting manner help to fix it in the soil. The seed alights vertically, the furrowed base of the awn becomes twisted, so that its furrows [illegible] becomes [illegible] seed is screwed into [illegible] being prevented by [illegible]. The [illegible] q. v. [illegible] the Common Feather [illegible]



[illegible] of the [illegible] the external covering [illegible] peculiar [illegible] [illegible] the feather [illegible] is wider [illegible] shaft, and [illegible] horny, [illegible] terminating [illegible] ex- [illegible] orifice [illegible] umbilicus, [illegible] into the [illegible], and termed [illegible] is situ- [illegible] opposite end, where [illegible] meet and unite. [illegible] the quill contains [illegible] capsules fitted [illegible] united by [illegible] structure presents [illegible] and lightness. [illegible] length than the [illegible] extremity; [illegible] or less convex [illegible] longitudinal groove [illegible] elastic, spongy [illegible] thin horny sheath.

At the point of junction of the shaft and quill, we usually observe—except on the feathers of the wings and tail—a small supplementary shaft given off, which is furnished with barbs or fibres, and is termed the plumule or accessory plume. In the ostrich it is altogether absent; in the rhea, it is represented by a tuft of down; in the emu, on the other hand, it equals the original feathers in size, so that the quill supports two shafts; and in the cassowary there is a second plumule of considerable size, so that the quill presents three distinct shafts.

The vanes or webs are composed of numerous barbs or small fibres arranged in a single series along each side of the shaft. They are fine prolongations of the outer coat of the shaft, are of a flattened form, and lie inclined towards the apex of the feather, with their flat sides towards each other, and their margins in the direction of the external and internal sides of the feather. The barbs are broader near the shaft than at the free apex, and in the large wing-feathers the convexity of one is received into the concavity of another. They are, however, generally kept in position by the barbules, which are minute curved filaments arising from the upper edge of the barb, much as the latter arises from the shaft. There are two sets of these barbules, one curved upwards, and the other downwards, and those of one barb hook so firmly into those of the next, as to form a close and compact surface. In the ostrich, the barbules are well developed, but are loose and separate, and it is this arrangement which gives to the feathers of this bird their soft, plumous appearance.

Feathers present numerous gradations of structure. In the cassowary, the wings, instead of being provided with ordinary feathers, are furnished with five cylindrical stalks destitute of barbs, so that here we have merely the quill and shaft. On the breast of the wild turkey there is a tuft of feathers resembling long black hair. In the *Dasylophus Cumingii*, the feathers of the crest, breast, and throat are changed, at their extremities, into round, horny lamellæ, looking like shining black spangles, and in the common waxwing or Bohemian chatterer, some of the wing-feathers present at their extremities small horny expansions, resembling red sealing-wax, both in colour and consistence.

Besides the common feathers, the skin of many birds, especially of aquatic species—in which plumules rarely exist—is covered with a thick coating of down, which may be described as consisting of very minute feathers, each of which is composed of a very small soft tube lying in the skin, from the interior of which arises a minute tuft of soft filaments, without any central shaft. This downy covering secures warmth without weight, like the soft fur at the base of the hair of arctic mammals. In most birds, the skin also bears a good many scattered hair-like appendages, which indicate their relations to the ordinary feathers by the presence of a few minute barbs towards the apex.

Feathers are developed in depressions of the lined by an inversion of the epidermis which rounds the bulb from which each feather spri they grow, much in the same manner as hair the addition of new cells from the bulb, becomes modified into the horny and fibrous and by the elongation of previously existing They are, when first formed, living vascular growing by nutrient vessels; but when the fully formed, the vessels become atrophied, and feathers become dried up, and gradually die f the summit to the base. For a full account of the development of the different parts, we must refer to Professor Owen's article, 'Aves,' and to Professor

Huxley's article, 'Tegumentary Appendages,' in the *Cyclopædia of Anatomy and Physiology*.

Feathers grow with great rapidity, and in some birds attain a length of more than two feet. They are almost always renewed annually, and in many species oftener; hence it may readily be conceived how much vital energy must be exhibited in their development, and how critical the period of moulting must be. The plumage is generally changed several times before it attains the state which is regarded as characteristic of the adult bird; these changes may occupy a period usually ranging from one to five years.

Notwithstanding their extravascular nature, feathers, as is well known, undergo a change of colour after they are completely formed. In yearling birds, the winter plumage, which succeeds the autumnal moult, gradually assumes brighter tints, the new colour commencing at the part of the vane nearest the body, and gradually extending outwards till it pervades the whole feather. Dr Weinland, an American naturalist, is of opinion, from a comparison of bleached specimens in museums, with recent ones taken from the bird, that the brightness and fading of the colours are due to the increase or diminution of an oily matter. Thus, the microscopic examination of the vane of feathers from the breast of a fresh merganser shewed numerous *lacunæ* containing a reddish oil-like fluid; some weeks after, the same feathers having become nearly white from exposure to light, disclosed air-bubbles instead of the reddish fluid. If this fluid is an actual oil, as is most probably the case, it could make its way into the non-vascular tissue by mere physical imbibition; and on the varying quantities of this oil the variations of plumage would depend.

The property possessed by the plumage of most birds, of keeping the surface protected from moisture, is well known. This is due to two causes. Most birds are provided with an oil-gland at the base of the tail, whose secretion is distributed over the feathers by means of the bill; and, additionally, the shedding of water is partly due to a thin plate of air entangled by the feathers.

The feathers vary in form in different parts of the body, and afford zoological characters for the distinction of species. Hence, they have received distinct names, such as primaries, secondaries, tertiaries, &c., in ornithology. These terms are explained in the article BIRDS.

The chief uses to which feathers are applied in the arts are three: *pens*, due to the peculiar elasticity of the barrels; *bed-feathers*, due to the combined softness and elasticity of the barbs; and *ornament*, due to the graceful forms and delicate tints of the whole feather. The mode of preparing the barrels for pens is described under QUILLS.

Bed-feathers were used in England in the time of Henry VII.; but it is not known how much earlier. At the present day, goose-feathers are preferred, the white rather than the gray. What are called *poultry* feathers, such as those of the turkey, duck, and fowl, are less esteemed, on account of their deficient elasticity. Wild-duck feathers are soft and elastic, but contain an oil difficult to remove. The following is one among several modes of preparing feathers for beds. Clean water is saturated with quicklime; the feathers are put into a tub; the lime-water is added to the depth of a few inches; the feathers are well steeped and stirred for three or four days; they are taken out, drained, washed in clean water, dried upon nets, shaken occasionally while drying, and finally beaten to expel any dust. The larger establishments, however, now prepare bed-feathers by steaming, which is found to be a more profitable and efficient process. The *down*, which is of so light and exquisite a texture as to have become the symbol of softness, is mostly taken from the breasts of birds, and forms a warm and delicate stuffing for beds, pillows, and coverlets. The most valuable is that obtained from the eider-duck, described under EIDER.

Feathers used for head-dresses, or other purposes of ornament, are selected according to the forms and colours which they display. The *ostrich*, a very valuable kind of feather, may be taken as an example of the way in which ornamental feathers generally are prepared by the *plumassier*. The mode of catching the bird itself is noticed under OSTRICH; it suffices here to state that the hunters endeavour to avoid injuring the feathers by blood or blows. When brought to England, the feathers are assorted according to quality; those from the back and above the wings are the best, the wing-feathers next best, and the tail-feathers least valued. The feathers of the male are rather more prized than those of the female. They are cleaned for use by repeated soakings and washings in water, sometimes with and sometimes without soap. There is also a process of bleaching by means of burning sulphur. When dried by being hung upon cords, the feathers pass into the hands of the dresser, who opens the fibres by shaking, gives phancy to the ribs by scraping them with bits of glass, and curls the filaments by passing the edge of a blunt knife over them. If the feathers, whether of the ostrich or any other bird, remain in the natural colour, little more has to be done; but if a change of tint be required, the feathers easily take dye-materials – such as safflower and lemon juice for rose-colour or pink, Brazil-wood for deep red, Brazil-wood and cudbear for crimson, indigo for blue, turmeric or weld for yellow, &c. A process of bleaching is adopted before the dyeing, except for black.

The kinds of feathers chiefly used for ornament are those of the ostrich, adjutant, rhea or American ostrich, emu, osprey, egrett, heron, antrenga, bird of paradise, swan, turkey, peacock, argus pheasant, ibis, eagle, and grebe. White ostrich feathers are prepared chiefly for ladies' head-dresses; and black for the Highland regiments and for funereal trappings. The white and gray marabout-stork feathers, imported from Calcutta, are beautifully soft and light, and are in request for head-dresses, muffs, and boas; the white kinds will sometimes sell for their weight in gold. The flossy kinds of rhea feather are used for military plumes, and the long brown wing feathers for brooms and brushes. Osprey and egrett feathers are mostly used for military plumes by Hussar troopers. Bird of Paradise feathers are much sought after by Oriental princes for turban-plumes. Cocks' feathers are used for ladies' riding-hats and for military plumes. Dr Macgowan, who was United States consul at Ningpo a few years ago, has described, in the *American Journal of Science and Art*, an ingenious process which the Chinese adopt for combining brilliant-coloured feathers with bits of coloured metal into garlands, chaplets, frontals, tiaras, and other ornamental articles.

FEBRI'CULA (Lat. a little fever), sometimes called also Ephemera (Gr. a fever of a day), a fever of short duration and mild character, having no distinct type or specific symptoms, by which it can be distinguished and described. See FEVER.

FE'BRIFUGE (Lat. *febris*, a fever, and *fugo*, I drive away), medicines calculated to remove or cut short Fever (q. v.).

FEBRO'NIANISM, in Roman Catholic theology, a system of doctrine antagonistic to the admitted claims of the Roman pontiff, and asserting the independence of national churches, and the diocesan rights of individual bishops in matters of local discipline and church government. The name is derived from the *nom de guerre*, Justinus 'Febronius,' assumed by John Nicholas von Hontheim, coadjutor archbishop of Treves, in a work on these subjects, entitled *De Præsenti Statu Ecclesiæ*, which he published in the year 1767, and which, with its several successive volumes, led to a violent and protracted controversy, and elicited the severest censures of the Roman tribunals. See HONTHEIM, GALLICANISM.

FE'BRUARY, the second month of the year, has ordinarily 28 days, but in leap-year it has an additional or intercalary day. Among the Romans, it had originally 29 days in an ordinary year, but when the senate decreed that the eighth month should bear the name of Augustus, a day was taken from February, and given to August, which had then only 30, that it might not be inferior to July. The name is derived from the circumstance, that during this month occurred the Roman festival called the Lupercalia, and also Februalia, from *februare*, to purify.

FE'BRUUS (connected with Lat. *februare*, to purify) was the name of an old Italian divinity, whose worship was celebrated with lustrations during the month of February. The ceremonies instituted in his honour were believed to have the effect of producing fertility in man and beast. F., whose name in the Etruscan language is said to have signified god of the lower world, was also worshipped as such by the Romans, and identified with the Greek Pluto.

FECAMP, a manufacturing town and seaport of France, in the department of Seine Inférieure, is situated in a narrow valley, flanked on either side by steep cliffs, at the mouth of a stream of the same name on the English Channel, 23 miles north-east of Havre. It consists mainly of one long street. Its principal building is the handsome church of Notre Dame, in the early pointed style, and dating from the 14th century. The harbour is frequented by colliers from Newcastle and Sunderland, and by Baltic timber-ships and fishing-vessels. F. has cotton-mills, sugar-refineries, tanneries, ship-building yards, and some linen-cloth and hardware manufactures. Pop. (1872) 12,534.

FE'CULA, or **FÆCULA**, is a term applied to starch obtained from various sources, but in France is generally restricted to the starch of the potato. See STARCH.

FECUNDATION, or **FERTILISATION**, in plants, takes place according to laws similar to those which prevail in the animal kingdom. In plants, however, the organs of reproduction are not permanent as in animals, but fall off—the male organs generally soon after fecundation, the female after the ripening of the seed. The male seminal substance, called *pollen*, never exists in a fluid state, but always in that of granules of various forms (*pollen grains*), which consist each of one cell, whose covering is of various thickness, and contains the impregnating substance. After the dehiscence of the anthers, the pollen gets into contact with the stigma of the pistil, which in its lowest and thickest part (the *ovary* or *germen*) contains the rudiments of the future seeds (*ovules*). The inner layer of the cell-covering of the pollen grain separates from the outer and thicker layer, as if it came out of a bag, and continuing to be elongated by growth, is carried down through the *style* to the germen, where it reaches the *foramen* or small opening of the embryo sac, and comes into contact with the ovule, or even in many cases penetrates into the ovule itself between its cells. By this time, one or other of the cells of the ovule has become considerably more enlarged than the other cells, and what is called the *amnion* has been formed, in the mucilaginous fluid of which (*protoblasma*), after the contact of the pollen-bag, through the dynamic operation of its contents, a *cell-germ* or *cytoblast* is soon developed. This cytoblast is the first commencement of a new and distinct cell, which divides into two cells. These increase, by continually repeated separation of new cells, into a cellular body, which forms the more or less perfect *embryo* of a new plant. If the organ from which the pollen has proceeded, and the organ which contained the ovule, belong to the same plant or to plants of the same species, the embryo arising from this fecundation becomes a plant of the same species. But if the pollen by which the fecundation is effected comes from a plant of another species than that to which the plant belongs in whose germen the embryo is formed, the seed resulting from this fecundation will not, when it grows, produce plants of the same species, but *hybrids*, intermediate between the parent plants, and with various degrees of resemblance to one or other of them, but not perfectly corresponding with either. Hence the production of hybrids, and multiplication of varieties of plants in gardens, by what is called the artificial impregnation of the stigma of one plant with the pollen of another, which, however, must be of an allied species, hybridisation being confined by the laws of nature within very narrow limits. See REPRODUCTION.

FEDERAL GOVERNMENT (Lat. *fœderatus*, bound by treaty, from *fœdus*, a treaty). When several states, otherwise independent, bind themselves together by a treaty, so as to present to the external world the aspect of a single state, without wholly renouncing their individual powers of internal self-government, they are said to form a Federation. The contracting parties are sovereign states acting through their representatives; and the extent to which the central overrules the local legislatures is fixed by the terms of the contract. In so far as the local sovereignty is renounced, and the central power becomes sovereign within the limits of the federated states, the federation approaches to the character of a Union; and the only renunciation of sovereignty which a federation as such necessarily implies, consists in abandoning the power which each separate state otherwise would possess of forming independent relations with foreign states. 'There are,' says Mr Mill, 'two different modes of organising a federal union. The federal authorities may represent the governments solely, and their acts may be obligatory only on the governments as such, or they may have the power of enacting laws and issuing orders which are binding directly on individual citizens. The former is the plan of the German so-called confederation, and of the Swiss constitution previous to 1847. It was tried in America for a few years immediately following the war of independence. The other principle is that of the existing constitution of the United States, and has been adopted within the last dozen years by the Swiss confederacy. The federal congress of the American Union is a substantive part of the government of every individual state. Within the limits of its attributions, it makes laws which are obeyed by every citizen individually, executes them through its own officers, and enforces them by its own tribunals. This is the only principle which has been found, or which is even likely to produce an effective federal government. A union between the governments only is a mere alliance, and subject to all the contingencies which render alliances precarious.'—*Representative Government*, pp. 301, 302. One of the chief difficulties which arise in organising a federal government, consists in discovering by what means disagreements between one or more of the local governments and the central government as to the limits of their respective powers, are to be disposed of. The arrangement by which this object was sought to be effected in America, of which M. de Tocqueville expressed his admiration, is thus explained by Mr Mill: 'Under the more perfect mode of federation, where every citizen of each particular state owes obedience to two governments—that of his own state, and that of the federation—it is evidently necessary not only that the constitutional limits of the authority of each should be precisely and clearly defined, but that the power to decide between them in any case of dispute should not reside in either of the governments, or in any functionary subject to it, but in an umpire independent of both. There must be a supreme court of justice, and a system of subordinate courts in every state of the union, before whom such questions shall be carried, and whose judgment on them, in the last stage of appeal, shall be final. Every state of the union, and the federal government itself, as well as every functionary of each, must be liable to be sued in those courts for exceeding their powers, or for non-performance of their federal duties, and must in general be obliged to employ those courts as the instrument for enforcing their federal rights. This involves the remarkable consequence, actually realised in the United States, that a court of justice, the highest federal tribunal, is supreme over the various governments, both state and federal, having the right to declare that any new law made, or act done by them, exceeds the powers assigned to them by the federal constitution, and, in consequence, has no legal validity.' (P. 305.) 'The tribunals which act as umpires between the federal and state governments naturally also decide all disputes between two states, or between a citizen of one state and the government of another. The usual remedies between nations, war and diplomacy, being precluded by the federal union, it is necessary that a judicial remedy should supply their place. The supreme court of the federation dispenses international law, and is the first great example of what is now one of the most prominent wants of civilised society, a real international tribunal.' Mr Mills' confidence in this remarkable tribunal, in which De Tocqueville shared, was disappointed. It proved unequal to the strain on the constitution caused by the political jealousies which in 1860 culminated in the great Secession war. But, in ordinary circumstances, there is no reason to question its value in vindicating either federal or state rights.

FEE AND LIFERENT (in the Law of Scotland)—the first of which is the full right of proprietorship, the second the limited right of usufruct during life—may be held together, or may co-exist in different persons at the same time. The settling of the limits of the rights which in the latter case they respectively confer, is of very great practical importance, and, from the loose way in which both expressions have been used by conveyancers, by no means free from difficulty. 'In common language,' says Mr Bell, 'they are quite distinct; liferent importing a life-interest merely, fee a full right of property in reversion after a liferent. But the proper meaning of the word liferent has sometimes been confounded by a combination with the word fee, so as in some degree to lose its appropriate sense, and occasionally to import a fee. This seems to have begun chiefly in destinations "to husband and wife, in conjunct fee and liferent and children in fee;" where the true meaning is, that each spouse has a joint liferent while both live, but that each has a possible fee, as it is uncertain which is to survive. The same confusion of terms came to be extended to the case of a destination to parent and child "to A. B. in liferent, and the heirs of the marriage in fee"—where the word liferent was held to confer a fee on the parent. It came gradually to be held as the technical meaning of the words "liferent to a parent, with fee to his children nascituri," that the word liferent meant a fee in the father. Finally, the expression came to be held as strictly limited to its proper meaning by the accompanying word "allenarly," or some similar expression of restriction; or where the fee was given to children nati and nominatim; there being in that case no necessity to divert the word liferent from its proper meaning, or, on a similar principle, where the settlement was by means of a trust created to take up the fee.' (*Prin.* s. 1712.)

FEE, ESTATE IN, the largest estate in land in point of quantity of estate known to the law of England, being a Freehold (q. v.) of inheritance. Estates in fee are divided into fee-simple and fee-tail. A fee simple is defined by Littleton (1, a.) to be a lawful and pure inheritance. In order to create an estate in fee-simple by deed, it is necessary that the word heirs should be used; for a gift by deed to a man for ever, or to a man and his assigns for ever, creates only an estate for life. But words of perpetuity annexed to a gift to a man by will are construed as carrying an estate in fee. The proprietor of an estate in fee-simple enjoys the fullest rights of property over his estate, which he may alienate or burden at pleasure, and out of which he may grant estates of a lower kind, as for life or years. He is owner of the soil '*a cœlo usque ad centrum*,' and is therefore entitled to every product of the land, as timber, &c., and to all minerals and other valuable productions found beneath the surface. On his death, the estate descends to his right heirs, except in the case of fees held by corporations, which descend to their successors in office. Where a man claims an estate in fee-simple in possession in a corporeal Hereditament (q. v.), he is said to be 'seised in his demesne as of fee.' Estates in fee-simple are divided into fee-simple absolute, qualified or base, and conditional. A qualified or base fee differs from a fee-simple absolute by having a qualification annexed which may determine the estate, as where it is granted to a man and his heirs 'tenants of the manor of Dale.' If, therefore, at any time the holder of the estate ceases to be the tenant of Dale, the estate, which depended on that qualification, determines.

A *conditional fee* was limited to a particular class of heirs, to the exclusion of others, as to a man and the heirs-male of his body. On failure of heirs-male of the body of the grantee, an estate of this kind reverted to the grantor or his heirs. But although the estate was thus limited, by the terms of the deed, to a particular series of heirs, the judges previous to the reign of Edward I. held that the gift was a fee-simple on condition of the birth of heirs of the body of the grantee, and that on the birth of an heir of the body, the condition on which the estate was held was purified. The estate did not indeed become *ipso facto* a fee-simple absolute, but the grantee was held entitled to sell the estate, to forfeit it for treason, and to burden it with encumbrances. But if the estate was not sold, and descended to the heir, he continued to hold a fee-simple conditional. This state of things led to the famous statute *De Donis Conditionalibus* (13 Ed. I. c. 1), whereby it was enacted that estates should be held *secundum formam doni*. Estates created by this statute were called estates in *fee-tail*. See ENTAIL.

The original mode of transferring an estate in fee was by Feoffment (q. v.), but the statute of Frauds (29 Char. II. c. 3) requiring that writing should be used in all transfers of land, estates in fee must now be conveyed by deed or will.

The proprietor of an estate in fee-simple in the present day is substantially absolute owner of the freehold, which he holds without owing duty or service to any one, except the allegiance due to the sovereign, who is regarded as supreme lord of all the lands in the kingdom. But originally this was not so; an estate in fee is in its nature a feudal benefice, a feud, and the owner of the fee held his estate subject to all the services incident to the feudal state. But these duties have been by degrees entirely abolished in England. See FEUDAL SYSTEM, TENURES. In Scotland, the feudal usages in regard to land are still retained to a very great extent. See Paterson's *Compendium of English and Scotch Law*. An estate in fee in Scotland must be held by one of the three existing tenures—viz., feu, blanch, or burgage, and is subject to the casualties (q. v.) attaching to these rights. See HERITABLE RIGHTS.

FEE-FUND, in Scotland, is the fund arising from the payment of dues of court on the tabling of summonses, the extracting of decrees, and the like. Out of this fund, the clerks and other inferior officers of the court were paid. If the fund was at any time insufficient for the purposes to which it was applied, the deficiency was supplied out of the moneys provided by the acts 7 and 10 Anne for keeping up the Scottish courts of law. The offices of collector and accountant of the fee-fund were abolished in 1868, and the duty is now collected by stamps.

FEEJEE. See FIJI.

FEELING. See EMOTION.

FEES. Neither barristers nor physicians could recover their fees by legal proceedings against their clients or patients, except under a special contract. The ground of this rule was that they are regarded not as payment, but as an expression of gratitude for services the value of which cannot be appreciated in money. The origin of the rule in the case of the advocates, is traced to the relation which subsisted between patrons and their clients in ancient Rome. When the former appeared as the defenders of the latter, they practised, as Blackstone says (iii. 29, Kerr's ed.), *gratis*, for honour merely, or at the most for the sake of gaining influence; and so likewise, it is established with us that a counsel can maintain no action for his fees, which are given, not as *locatio vel conductio*, but as *quiddam honorarium*; not as a salary or hire, but as a mere gratuity, which a counsellor cannot demand without doing wrong to his reputation. The rule at Rome was maintained even under the emperors, and Tacitus mentions (*Ann.* lib. ii. c. 5) that it was directed by a decree of the senate that these *honoraria* should not in any case exceed 10,000 sesterces, or about £80 of English money. It has further been decided in England, that no action lies to recover back a fee given to a barrister to argue a cause which he did not attend (Peake, 122). But special pleaders, equity draftsmen, and conveyancers, who have taken out certificates to practise under the bar, and therefore are not counsel, may recover their reasonable charges for business done by them (Poucher v. Norman, 3 B. and C., 744). Another rule with reference to the fees of barristers and advocates is, that they are paid before they are earned; a rule which, by removing from its members all pecuniary interest in the issue of suits, has done mo maintain the independence and respectabi the bar. As regards physicians, the rule fee could not be recovered by an action at l applied in the case of Chorley v. Bolcot, J 1791 (4 T. R. 317). If, however, either a or a physician acted under a special agre promise of a certain payment, then an a be brought for the money. But all medica ers were relieved from the above code of hono the act of 21 and 22 Vict. 90, which applied t United Kingdom, and enabled them to recov any court of law their reasonable charges as we costs of medicines and medical appliances This rule applies to physicians, surgeons, apothecaries as defined by the statute. Memb the inferior branches of both professions—attor solicitors, &c., on the one hand, and surg dentists, cuppers, and the like on the other— always entitled to raise action for their fees Scotland, the same rules prevail as in England reference to both professions. In France, the delicate sense of honour of the bar has been preserved with quite as much care England, the rule is somewhat different. In action for the recovery of fees would be ma able in that country by an advocate; but Paris, the rule of the ancient bar, founde the disinterestedness which was its characte and according to which any judicial dema payment of fees was strictly forbidden under of erasure from the table (of advocates), has religiously preserved.'—*History of the French* by Robert Jones, 1855. The practice in Fr however, seems to be for the fees of advocates paid afterwards, though any bargain with the or his agent that their amount shall dep the issue of a trial, is regarded as dishon and on several occasions the bar has resisted regulations calling on them to ac receipt of their fees, as wounding their There can scarcely be a stronger proof of th of what seem in themselves to be trifling pedantic pieces of etiquette, than the dignified independent position, which, from its scr sense of honour, the French bar has during all the political revolutions country has undergone.

FEHÉRVÁR (SZÉKES), the same as the *Alba Regia*, or the German *Stuhlweissenburg*, i of the most ancient royal free towns of Hu situated in a marshy district about 40 miles west of Pesth. Under the Arpádian kings, i the metropolis of the realm, and the residen the sovereigns, who have been often crowned buried there. On many occasions, the diets also held in F., where twelve kings—among which St Stephen, and the great Mathias Cor buried. It is the seat of a bishop, and c population of 21,000, chiefly Roman Cath all of the Magyar race. Water is supplie artesian well.

FÉIA, a large lake of Brazil, lies on the time border of the province of Rio Janeiro, distant 150 miles, to the north-east, from the of the same name. It is so near to the that it has been connected with it by mea canal. F. is about a degree to the north of southern tropic.

FEIGNING OF DISEASE is much in the army and navy, and also by co others anxious to escape from discipline, a discharge from compulsory service. it is technically called *malingering*. of feigned disease, of course, necess the highly educated physician, and is impossible without a thorough knowledge of the reality, unless, indeed, the imitation be very coarse and badly studied. The diseases most commonly simulated are epilepsy, catalepsy, convulsions, blindness, deafness, palsy, insanity, indigestion, neuralgia, rheumatism, palpitation of the heart, and generally all disorders which may exist without leading to any distinct external appearances. Ulcers of the legs, however, have often been made, and kept open artificially through the application of irritant substances; and vomiting or coughing up of blood is very easily simulated, if the supposed patient can get access to the necessary materials in the slaughter-house or elsewhere. The detection of such impostures is easy or not according to the opportunities and knowledge and skill of the deceiver, as compared with those brought to bear on the discovery of the fraud. Many men in the public services, and women affected with hysteria, have become so expert as to deceive even men of high character and skill. The writer has known of an instance in which a man [illegible] ted to successive amputations of the arm [illegible], nearly to the shoulder, for an ulcer pro[illegible]d and kept open at will by local applications; [illegible] case has been lately recorded by Dr Murchison [illegible] Medico-chirurgical Transactions, in which [illegible] no reasonable doubt that a large opening [illegible] stomach was the result of caustic substances [illegible]rately applied to the abdomen, with the view [illegible]ting sympathy.

FE[illegible]T (from the Fr. *feindre*), in military or [illegible] matters, a mock attack or assault, usually [illegible] to throw an enemy off his guard against some [illegible] upon his position. See FENCING.

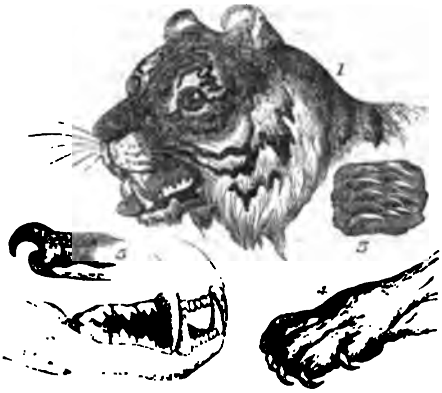
[illegible], RHIJNVIS, a distinguished Dutch poet, who ranks next to Bilderdijk (q. v.) as a reviver [illegible] national poetry, was born 7th February 1753, [illegible]oll in Overyssel, studied law at Leyden, and [illegible] to his native town in 1776, where he held [illegible] of burgomaster. He died 8th February 1824. [illegible] almost all kinds of poetry. In his earlier [illegible]tions, he shewed an excessive inclination [illegible] sentimental; but in 1792 appeared his *Het* [illegible] (The Tomb), a didactic poem, which, though [illegible] free from the weakness referred to, is yet on [illegible] whole happily conceived, and contains some [illegible] passages. His *De Ouderdom* (Old Age), [illegible]hed in 1802, is deficient in plan. Among [illegible]rical pieces, *Oden en Gedichten* (Odes and Mis[illegible] Poems, 4 vols., Amst. 1796—1810), are [illegible] marked by a high enthusiasm and warmth of [illegible]g. Of his tragedies, the best known are *Thirza* [illegible] *Johanna Gray* (1791), and *Ines de Castro* [illegible] Along with Bilderdijk, he recast in a nobler [illegible] maren's famous patriotic poem, *De Geuzen* (Les [illegible] or the Beggars), which celebrates the first [illegible] of the Dutch for independence. Of F.'s [illegible] works, the most important are *Brieven over* [illegible] *Onderwerpen* (Letters on Different Subjects, 6 vols., Amst. 1784—1790). These Letters, [illegible] their polished style and refined criticism, did [illegible] to improve the literary taste of Holland.

[illegible]DMANN, LEOPOLD, a German writer of [illegible], was born at Munich in 1803, of Jewish [illegible] to whose faith he remains attached. [illegible] in 1815 to a saddler, and afterwards [illegible] cobbler, he soon gave evidence of his deter[illegible]ation to be a poet by sending, in a pair of shoes, [illegible] he had mended, a poetical expression of his [illegible] to their fair wearer. For this his master [illegible] him back to school, where in 1817, when only [illegible] 14th year, he wrote a play, *Der Falsche Eid* [illegible] Oath), which was actually produced on [illegible] After spending a few years in business at Pappenheim, and subsequently in Munich, he was induced, by the reputation which he gained from some humorous pieces, entitled *Genrebilder*, to devote himself entirely to literature. In 1835, his *Höllen-lieder* (Hell-Songs) appeared; and his first comedy, *Der Sohn auf Reisen* (The Son on his Travels), was acted in Munich with applause. While travelling thereafter for five years, chiefly in Greece, he wrote 'Pictures of Travel' for Lewald's *Europa*, and the correspondence for the *Allgemeine Zeitung*. In 1841, his comedy was produced in Vienna, and since 1850, he has been employed as histrionic teacher in the National Theatre of that capital. F.'s works, which are numerous, are reckoned among the best specimens of modern German comedy, pleasing by their cheerful humour, and happy employment of contemporary ideas and events, though complained of as deficient in artistic finish. F. has published a collection of his comedies in six volumes (*Deutsche Originallustspiele* (Original German Comedies), Wien, 1844—1852).

FELEGYHA'ZA, a town of Little Cumania, Hungary, is situated on the railway between Pesth and Temesvar, 67 miles south-east from the former. It has an extensive trade in grain, fruit, wine, tobacco, and cattle. In the neighbourhood, several Roman urns have been found. Pop. 17,900.

FELICU'DI. See LIPARI ISLANDS.

FE'LIDÆ, or **FELI'NÆ**, a family of digitigrade carnivorous quadrupeds (see CARNIVORA and DIGITIGRADA), corresponding to the genus *Felis* of Linnaeus, and sometimes collectively called *cats* or the *cat tribe*. They are, generally speaking, the most carnivorous of all the *Carnivora*, holding the same relative place among quadrupeds that the *Falconidæ* do among birds. Their organisation is admirably suitable to their habits. They have a very lithe muscular frame; the body is rather long, and remarkably flexible; the limbs generally short. Few of the species possess much fleetness, but most of them excel in climbing and in leaping. When moving rapidly over the surface of the ground, they generally advance by a series of zigzag bounds, rather than by direct running. They are mostly inhabitants of forests, and many even of the larger species live much among the branches of trees, although some of the largest do not leave the ground. They all advance stealthily on their prey, which all of them kill for themselves, and devour in a perfectly fresh state, and generally whilst still warm and quivering. When they have approached within a sufficient distance, they complete the seizure by a spring, many of them uttering a roar or yell as they do so, and thus rendering their victory more secure by the consternation which paralyses the object of their attack. Their movements are extremely noiseless, owing to the soft velvety pads with which their toes are provided. Their claws are strong, much curved, very sharp, and retractile; being withdrawn by special muscles and ligaments into sheaths when not in use, and their points even turned upwards, so that they are not blunted by unnecessary friction, and do not interfere with the movements of the animal by accidentally hooking objects which are in the way. The last bone (*phalanx*) and joint of the toe exhibit peculiarities requisite for the extension and retraction of the claws. The fore-feet have five toes, the hind-feet four. The head of the F. is characterised by great breadth of skull, whilst the muzzle is short, and sometimes even rounded; the jaws are moved by very powerful muscles, and the articulation of the lower jaw is such that it has no rotatory motion; the teeth also being so shaped, and those of the two jaws so fitting to each other, that they cut like scissors—the lower teeth shutting within the upper—and are not at all adapted to the trituration of food. There are six small incisors in each jaw, followed on each side by one very large canine tooth, adapted for prehension; and this by two præmolars, or false molars, which, particularly in the lower jaw, are compressed and sharp-edged, their edges rising to a central summit, with inferior lateral cusps, so that flesh between them is subjected to a cutting action in various directions. Finally, there is on each side of each jaw one true molar, and in the upper jaw of many species, a second true molar. The crowns of all the teeth are covered with enamel. The tongue is rough, with horny papillæ directed backwards, by which it is fitted for cleaning the bones of the prey. The stomach is simple, the intestines short, and digestion rapid. The senses of sight and hearing are extremely acute; the eyes are adapted to seeing both by day and by night; the sense of smelling is also very acute, although apparently not equal to that of dogs; the sense of taste is supposed to be less acute; the bulbs from which the long whiskers arise appear to possess the sense of touch in great perfection, and the whiskers thus become useful in the progress of the animal through entangled thickets.



Characteristic Features of the Felidæ:
1, tiger's head; 2, shewing the dentition; 3, portion of tongue; 4, right fore paw, shewing claws; 5, claw, shewing tendons.

The F. agree so much in form and structure, that many naturalists still refuse to divide the Linnæan genus *Felis*. None of the F. are gregarious. Almost all of them, when taken young, seem capable of domestication, but in general they are little to be trusted. The species are numerous. They are distributed over Europe, Asia, Africa, America, and the islands adjacent to these continents; but none are found in Australia, where their place is supplied by the carnivorous marsupial quadrupeds. The largest species are chiefly found in warm climates. No species is known to be common to the Old and New worlds, although some are very nearly allied.

Vast numbers of the larger F. were brought from Africa and the East for those savage sports and shows in which the ancient Romans delighted. Five hundred lions were slain in five days at the opening of Pompey's theatre, and five hundred panthers have been let loose at once in a similar Roman arena. The wealth of Indian princes has also been often spent in fights of such beasts.

The principal F. are noticed in separate articles, as LION, TIGER, JAGUAR, PUMA, LEOPARD, PANTHER, CAT, TIGER-CAT, LYNX, CHEETAH, OUNCE, CARACAL, SERVAL, OCELOT, &c.

FE'LIX, ANTONIUS, a Roman procurato Judæa (51—62 A.D.) in the time of the Ap Paul, was a freedman of the Emperor Claudi The circumstances under which he received appointment are related differently by Tacitus Josephus. His government, politically consi was in some respects good. According to Jos and other authorities, he cleared the countr robbers, and vigorously suppressed the ch seditions of the Jews; but his cruelty, lust, greed were unbounded. His wife was Drusi beautiful but renegade Jewess, whom he induced to abandon her first husband, and to a questionable connection with himself. It therefore not at all wonderful that F. sh tremble as Paul reasoned of 'righteousness, tem ance, and judgment to come' (Acts xxiv. He was recalled to Rome, 62 A.D., on accou the accusations preferred against him by the i ential Jews of Cæsarea, and narrowly escaped sentence of death.

FE'LIX (POPE) I.—IV.—FELIX I., reckoned 26th in the succession of popes, succeeded Diony in the see of Rome probably in the year 269. pontificate is chiefly interesting as an early exa of the relations of the Christian Church to the Ro empire, and of the recognition by the state of civil rights of Christians. In the pontificat Felix's predecessor, Dionysius, Paul of Samo Bishop of Antioch, had been deposed by a co held in that city. Paul having resisted the tence, the matter was laid before Felix, Di being now dead; and, as Paul held posses the church and church buildings, the bishops obliged to claim the interference of the Aurelian, who was passing through Antioch return from Palmyra. Aurelian returned a dec which is often appealed to in modern controv to the effect that the buildings should belo the person 'to whom they should be adju the bishops of Italy and Rome.' Felix suffered martyrdom in the persecution of emperor, Aurelian, probably in 274.—FELI occupied the Roman see during the banis Liberius, in 355. It is agreed on all ha his first appointment was intrusive, b diversity of opinion exists as to his su career. In reply to a petition for the of Liberius, it was proposed by the Constantius that Liberius and Felix exercise jurisdiction jointly; but this prop was rejected by the Romans, and Felix to have been compelled to retire from th According to the *Liber Pontificalis*, he martyrdom in the end, at the hands of his patron, Constantius; but this is not confirm any contemporary authority.—FELIX III. o the see of Rome from 483 till 492. He native of Rome, and of the family from afterwards sprung Pope Gregory the Great. pontificate is historically memorable, as prese the first commencement of the disruption of Greek and Roman churches. The contem occupant of the see of Constantinople, Acac well as the imperial court, was a favourer Monophysite party, who refused to acce decision of the council of Chalcedon. See PHYSITES. By their influence, the patriarc Alexandria was deposed, and replaced by monophysite, Peter Mongus. The deposed p arch having appealed to Rome, Felix sent legates to Constantinople, to require his restorat and the legates having failed in their trust Acacius still adhering to the heterodox party, assembled a council at Rome, and excommun not only the offending legates, but also himself, the sentence being pinned by a monk upon the back of the patriarch's robes while he was actually officiating in the church. Felix had previously rejected the *Henoticon*, or Decree of Union, published by the Emperor Zeno. The schism thus inaugurated was not healed till the year 519. The only literary remains of this pontiff are the letters and other acts of this controversy. He died February 24, 492.—FELIX IV., a native of Benevento, succeeded John I. in 526. His pontificate presents no noteworthy event. He died in 530.—FELIX V. (anti-pope). See AMADEUS.

FELIXIANS, a Spanish sect of the latter part of the 8th c., so called from Felix, Bishop of Urgel. See ADOPTIAN CONTROVERSY.

FELLAH (plural, EL FELLAHIN), an Arabic word meaning peasant or agriculturist, specially applied to the agricultural or labouring population of Egypt by the Turks, in a contemptuous sense, as 'clowns,' or 'boors.' They form the great bulk of the population, and are descendants of the ancient Egyptians, intermingled with Syrians, Arabs, and other races who have been converted to Islam. In their physical conformation and features, they differ among themselves, those of the northern provinces of the Mediterranean being of whiter hue, while at Assouan they are almost black. They are described as having a large skull, facial angle almost 90 degrees, oval face, arched eyebrows, deep eyes, projecting lips, large mouth, a beard, short nose, large chest, and small belly; bent back, and small hands and feet, and being mean height. They form the fourth class of population, and are distinguished from the douin or free Arabs, who have entered the country later than the Saracenic conquest, and the Arabs of the towns and villages. Their dress consists of a shirt and linen drawers, over which is a longer blue shirt (*kerve*), girdled by a leather or belt, which is exchanged in the winter for a with sleeves (*zaboot*). On their head, they the *tarboush*, turban, or a black or gray cap; women tattoo themselves, and are nubile at early age, being often married at 11 years, hers at 12, and grandmothers at 24. The of the Fellahin consists entirely of vegetables, ch they eat in a crude state, dhourra bread, beans. Even rice is too dear for them and l food unattainable. Their drink is limited waters of the Nile and coffee, and the luxury which they enjoy is the green tobacco country; yet on this diet they are robust ealthy, and capable of much labour and e. In their social position, they are inferior e Bedouin, who, although they will marry daughters of the Fellahin, will not give to their own in marriage. They appear to it the moral qualities of the ancient Egyptians, intelligent, grave, and calm, docile, pliable, sober on the one hand; and idle, jealous, rrelsome, satirical, licentious, and of unbending nacy, on the other, and inherit the traditional red of their ancestors to the payment of taxes, ch are often only extorted by the bastinado. ir political condition is most miserable. Each age is governed by a Sheik-el-Beled, who is nsible to the Nazirs and Mamours, or district ors, for the conduct of the inhabitants, and r the payment of taxes. So oppressive, indeed, the taxation and extortion, scarcely [illegible] of the produce falling to their lot, that it would not be possible for them to live if it were carried to a higher pitch, and none cultivate the lands with diligence unless compelled by their superiors. Gliddon, *Types of Mankind*, p. 319; Lepsius, *Egypt and Ethiopia*, p. 76; Lane, *Manners and Customs of Modern Egyptians*, pp. 125, 126, 192, 193; Clot Bey, *Aperçu générale*, i. pp. 159, 160.

FELLENBERG, PHILIP EMANUEL VON, the founder of the institution for the improvement of education and agriculture at Hofwyl in the canton of Bern, in Switzerland, was born at Bern in 1771. His father was a man of patrician rank, and in consequence, a member of the government. From him F. received a very careful education; but it was his mother, a great-grand-daughter of the famous Dutch admiral, Van Tromp, who inspired him with the ardent desire of being useful to his fellow-creatures. In 1789, he went to the university at Tubingen, for the purpose of studying law, and subsequently travelled in various parts of Europe, taking up his quarters not in the hotels of the large towns, but in the cottages of the peasantry, that he might know at first hand the real condition and the manners of the poor, as well as the kind of education received by those whose life was to be spent in agricultural pursuits. When the revolution of 1798 broke out in Switzerland, F. took part in it for some time; but the faithlessness and want of public spirit on the part of the Bernese government induced him to withdraw from political life altogether, and to devote himself solely to philanthropic schemes. He now purchased the estate of Hofwyl, near Bern, and soon after entered into an alliance with Pestalozzi, the educationist. Their different characters, however, rendered such a union impracticable, and they found it necessary to separate. F. now proceeded with redoubled zeal to increase the produce of his estate by new improvements, to influence the neighbourhood by his example, and to make his experiments known to the world by his agricultural treatises. At the same time, he founded an asylum for forsaken children. He also opened a school of theoretical and practical agriculture, and connected with it an institution for the education of the children of the higher classes. The establishment at Hofwyl acquired for its founder a very great reputation, and pupils hastened to it from all quarters. Many foreign princes visited it, and on their return to their own countries, founded similar institutions. In the year 1830, F. founded a school of art, and some years later, an infant school. He died 21st November 1844. The institutions at Hofwyl were continued for some years by his son Wilhelm, and then entirely given up. Compare Hamm, *F.'s Leben und Wirken* (Bern, 1845).

FELLOWS, SIR CHARLES, an antiquary of considerable reputation, was born at Nottingham in 1799. In the beginning of 1838, he commenced those travels in the East by means of which his name has been brought so prominently into public notice. His researches were chiefly confined to the western peninsula of Asia Minor, and to the course of the ancient Xanthus, in the south of that peninsula. Commencing his investigations at Patara, at the mouth of the Xanthus, and proceeding inland along the valley of that river, he discovered, only nine miles from the coast, the ruins of the city of Xanthus, formerly the capital of Lycia. Fourteen or fifteen miles higher up the river, he met with the ruins of another city, which, from inscriptions, he found to be the ancient Tlos. Having made drawings of some of the fine remains of architecture and sculpture which he found in the ruins of these cities, and copies of some of the inscriptions, F. returned to England, and published *A Journal written during an Excursion in Asia Minor, by Charles Fellows*, 1838 (Lond. 1839). In 1839, he again visited Lycia, and in the course of another excursion, he discovered the ruins of no less than thirteen cities, each of which contained works of art. Another Journal, entitled *An Account of Discoveries in Lycia, being a Journal kept during a Second Excursion in Asia Minor* (Lond. 1841), was the result of this journey. In 1841, an expedition left England for the purpose of selecting works of art from the ancient cities discovered by F., who accompanied the expedition, and directed its operations. Authorised by a firman from the sultan, they made their selections, and returned in the spring of 1842. Another expedition sent out by the trustees of the British Museum brought home twenty cases of marbles and casts in 1844. These remains have been deposited in the British Museum in what has been called the Lycian Saloon. In 1845, F.'s labours were rewarded by the honour of knighthood. The other works of F. are—*The Xanthian Marbles: their Acquisition and Transmission to England* (1843); *An Account of the Ionic Trophy Monument Excavated at Xanthus* (1848); a re-issue of his earlier Journals under the title of *Travels and Researches in Asia Minor, particularly in the Province of Lycia* (1852); and *Coins of Ancient Lycia before the Reign of Alexander; with an Essay on the Relative Dates of the Lycian Monuments in the British Museum* (1855). He died in 1860.

FE'LLOWSHIP, IN A UNIVERSITY. As the history of this institution will be treated under UNIVERSITY, we shall here only mention its leading characteristics, as it exists in the two great universities of England—Oxford and Cambridge. In these ancient and celebrated seats of learning, the fellowships were either constituted by the original founders of the colleges to which they belong, or they have been since endowed. In almost all cases, their holders must have taken at least the first degree of Bachelor of Arts, or student in the civil law. One of the greatest changes introduced by the commissioners under the University Act of 1854, was the throwing open of the fellowships to all members of the university of requisite standing, by removing the old restrictions by which many of them were confined to founder's kin, or to the inhabitants of certain dioceses, archdeaconries, or other districts. Fellowships vary greatly in value. Some of the best at Oxford, in good years, are said to reach £700, or even £800, whilst there are others which do not amount to £100, and many at Cambridge which fall short of that sum. Being paid out of the college revenues which arise from land, they also vary from year to year, though from this arrangement, on the other hand, their general value with reference to the value of commodities is preserved nearly unchangeable, which would not be the case if they consisted of a fixed payment in money. The senior fellowships are the most lucrative, a system of promotion being established among their holders; but they all confer on their holders the privilege of occupying apartments in the college, and generally, in addition, certain perquisites as to meals or commons. Many fellowships are tenable for life, but in general they are forfeited should the holder attain to certain preferments in the church or at the bar, and sometimes in the case of his succeeding to property above a certain amount. In general, also, they are forfeited by marriage, though this disability may now be removed by a special vote of the college, permitting the fellow to retain his fellowship notwithstanding his marriage. With the single exception of Downing College, Cambridge, in which the graduates of both universities are eligible, the fellowships are confined to the graduates of the university to which they belong.

FE'LLOWSHIP. See PARTNERSHIP.

FE'LO DE SE, in English Law, is where the age of discretion, and *compos mentis*, vol kills himself. 'No man,' says Sir M. Hale (*Pl. Cr.* 411), 'hath the absolute interest of 1st, God Almighty has an interest and him, and therefore self-murder is a sin against 2d, The king hath an interest in him, and the injunction in case of self-murder is *voluntariè se interfecit et murderavit contra domini regis.*' A man or woman is considered age in regard to capital offences at the fourteen. A lunatic killing himself during a not guilty of felo de se; but a merely melan and hypochondriacal temperament is not such of mind as will relieve a person from the quences of this offence. Where two persons to die together, and in pursuance of this desig or both die, it is suicide, or felo de se. And in cases, where one maliciously attempts to kill an and unwittingly kills himself, this is said (Haw P. C. c. 27, s. 4) to be felo de se. But as a rule the act must be voluntary. Therefore, if ensue from a rash act not intended to kill, as a man cuts off his hand to prevent a gangrene the act is followed by death, this is not felo Formerly, the law punished this offence by ignominy on the body of the offender, ordered to be buried by night at four and that a stake should be driven thr body. But by 4 Geo. IV. c. 52, this mode of burial is abolished, and it that a felo de se shall be privately buried in a burial-ground. All the chattels, real personal, of a felo de se are forfeited to the In Scotland, the crime of self-murder is Suicide (q. v.).

FE'LON AND **FE'LONY.** The etym word felon has given rise to much d opinion. By the majority of the most cographers, it is supposed to have a with *fail*, and its original signification to be a vassal who failed in his fidelity or to his superior, thus committing an which he forfeited his fee or feud. came to signify traitorous or rebellious, gradually generalised till it reached its meaning of a crime of so heinous a infer a capital punishment.

The characteristic distinction of a felony, opinion of all legal writers, is, that it is a which occasions the forfeiture of the goods. 'Felony,' says Blackstone, 'in the acceptation of our English law, comprises species of crime which occasioned at the forfeiture of lands and goods. Treason says Sir Edward Coke, was anciently under the name of felony. . . . And not offences now capital are in some degree or ony, but...many other offences not death, as suicide, manslaughter, and larceny, submit the committers of them to forfeitures.' person is now convicted of felony, he does any of his property; but he forfeits and is for any government or public office. The order him to pay all the costs incurred in his conviction, as well as compensation to defrauded or injured by his felonious act. crown may during the sentence of on the execution of the felon, appoint to take possession of all his property, and until the sentence expires, dealing with as if he were bankrupt, by paying his del there is a surplus, keeping or reassigning it his heirs and representatives at the expirat sentence, 33 and 34 Vict. c. 23. Similar ar do not apply to Scotland.

FELSPAR (Ger. *feldspath*, field-spar), a mineral extremely abundant in almost all parts of the world. It is a principal constituent of many rocks, as granite, gneiss, greenstone, trachyte, &c.; and clays seem very generally to have resulted, at least in great part, from its decomposition. It occurs both massive and crystallised, in rhomboidal, pyramidal, and prismatic crystals, often having their edges and angles truncated, and thus very variously modified. There are many different kinds of F., which mineralogists have recently attempted to arrange in mineral species, distinguished by physical and chemical characters, and also by geognostic position, and by the groups of minerals with which they are associated. For these mineral species new names have been invented, *Orthoclase*, *Oligoclase*, *Albite*, *Labradorite*, &c. All the felspars are anhydrous silicates of alumina, and of an alkali or lime. Orthoclase, the other more silicious felspars containing h, abound chiefly in granite and the *plutonic* ; the less silicious, containing soda and lime, cterise the *volcanic* rocks 'as labradorite the tic group, glassy felspar the trachytic.' All kinds of F. are so hard as not to be easily tched with a knife, and are fused with diffi- . Some of them are soluble, some insoluble ls.—The kind known as COMMON F. referred *thoclase* - is generally white or flesh-coloured, a glassy and somewhat pearly lustre, is transat at least on the edges, and has an uneven or fracture. Crystals four or five inches long und in Aberdeenshire. This variety, under n of *Petunse* or *Petuntze*, is used by the in the manufacture of porcelain; along with of the quartz which is associated with it in rock. It is used, with other materials, as a ; and alone to form an enamel or glassy cover- without which the porcelain would absorb ture and grease, and would be unfit for any cept mere ornamental purposes.—ADULARIA is a transparent and almost colourless variety of F., often cut as an ornamental stone, the finest varieties, of which one is known as MOONSTONE, being prized almost as gems. A variety, found among rolled es in Ceylon, and remarkable for the reflection of early light, has been sometimes confounded with *'s Eye*.—AVANTURINE F. is similar to the variety quartz called *Avanturine* (q. v.) in the play of which it exhibits, and which is said to be to minute crystals of specular or titanic iron. ch esteemed as an ornamental stone. A , with golden yellow specks, called SUNSTONE, y rare and very beautiful: it sells at a high e.—LABRADORITE exhibits rich colours and a opalescence, on account of which it is used for ornamental purposes. A blue variety F. found only in Styria, and a green variety, s called *Amazon Stone*, are also esteemed as stones.—All the finer varieties of F. are racterised by a soft beauty, which well compen- s for the want of that brilliancy which belongs to the true gems.

Kaolin, or *Porcelain Clay*, is regarded as a decomposed felspar. To F. also are referred, as chiefly composed of it, or apparently derived from it, Felstone, Trachyte, Claystone, Clinkstone, Pitch- e, Obsidian, and Pumice.

FELSTONE, a name introduced by Professor Sedgwick to designate those rocks which are composed, either in whole or to a large extent, of felspar. When they consist of a compact and apparently amorphous felspar, they are known as Trachytes a variety of this rock, which splits into small slabs, that ring with a metallic sound, is called Phonolite. Trachyte, with distinct crystals of felspar scattered through it, becomes felstone porphyry; when the rock is in a vitreous condition, and has a resinous lustre, it is Pitchstone. Even in the most compact felstones, minute crystals may be detected, and these sometimes increase in size, till we have varieties which are completely granular and crystalline.

FELT, FELTING, a fabric formed without weaving, by taking advantage of the natural tendency of the fibres of hair and wool to interlace with and cling to each other. The hatters' tradition concerning the invention of felt affords as good an illustration as any we can find of the principle of this manufacture. In most Roman Catholic countries, the hatters celebrate as a festival the 23d of November, St Clement's Day, as they formerly did in this country; and it is stated that St Clement, when on a pilgrimage, put carded wool between his feet and the soles of his sandals, and found on his journey's end that the wool was converted into cloth. Although this tradition is very questionable, as the manufacture of felt is of far more ancient origin, there can be no doubt that if carded wool were thus continually trodden, and at the same time moistened, it would become felt, and all the manufacturer's processes of felting are but modifications of such treatment.

This matting or felting of the fibres of hair and wool results from their structure, for, when examined by the microscope, the hair of all animals is found to be more or less jagged or notched on its surface; in some animals it is distinctly barbed; and this structure is so directed that the teeth or barbs all point towards the tip of the hair. See HAIR. If a piece of human hair (in which this structure is less marked than in most animals) be held between the finger and thumb, and rubbed in the direction of its length, it will invariably move between the fingers in the direction of its root; for the skin, while moving towards the tip of the hair, slides freely upon it, but moving in the other direction, against the inclination of the barbs, it brings the hair with it. It will be easily understood that when a number of hairs are pressed together, those which lie in opposite directions to each other and in contact will interlock at these barbs or teeth, and thus resist any effort to tear them asunder. When once this close contact and interlocking is established between any two or more hairs, they remain attached, but the others that are differently arranged, or not in contact, will still be free to move upon each other; and therefore, if subjected to continual blows, pushing, and pressure, like the treading of the feet in walking, the unattached hairs will be continually shifting until they reach others in suitable positions for clinging together, either by crossing obliquely or by lying in the same line, and overlapping at their ends or any other portion. When the hair has a natural tendency to curl, the felting is still more readily brought about by the additional interlacing. This is the case with wool to such an extent, that when free from grease it cannot be retained in the straight carded condition required for spinning and weaving. When it is required to be felted, the natural grease has to be removed. This tendency to felt is shewn in the hard lumps formed in wool-mattresses that have been long used.

The beaver-hat maker produces his felt by taking a few ounces of the mixed fur, distributing it in an even layer by twanging a bowstring against the heap, and then condensing this into a felt by a sort of kneading process with his hands. See HAT.

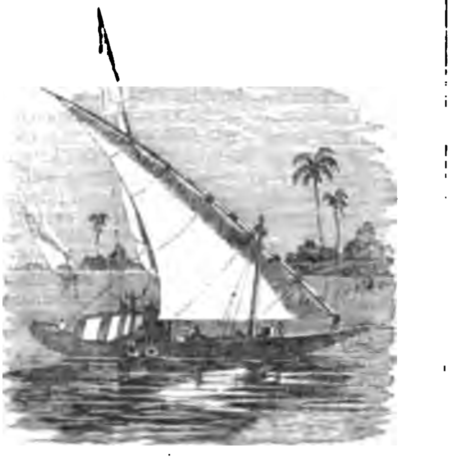
The felt now extensively used for carpeting and other purposes is made by machinery, chiefly from the waste wool from the weaving-mills. Many patents have been taken out for the various details of felting-machinery, but the main principle is the same in all. The wool is carded more or less perfectly, and steamed or moistened with hot water, and passed between beaters, which act like the pilgrim's feet in the manner already described. When used as drugget for covering carpets, or as a substitute for carpet, the felt is printed by means of blocks with various patterns, or simply dyed. Felt is also used for padding coats and other garments, sometimes for cloaks and capes; for table-covers, some of which are beautifully embossed and printed; for carriage-linings, upholstery work, polishing cloths, pianoforte hammers, and various other purposes where a coarse or thick cloth is required. A simple kind of saddle, cut out of very thick felt, is in common use in South America.

The 'felted sheathing' used as a non-conducting covering for retaining the heat in steam-boilers, is a substance intermediate between felt and paper, being composed of the commonest woollen refuse from paper-mills, &c., made into a semi-pulp, and beaten to produce a partial felting. This when dried hardens, and though possessing but little tenacity, and unfit for the wear of friction, is, from its compactness, better adapted than ordinary felt for the purposes to which it is applied.

Asphalted Roofing-felt is a very coarse felt saturated with pitch, asphalt or coal-tar—usually the latter, on account of its cheapness; it is retailed at one penny per foot, and used for covering sheds and other buildings. A more expensive kind, free from coal-tar, is called *Inodorous Felt*, and used as a lining for damp walls upon which paper has to be hung. Asphalted felt is also used as a flooring for granaries and similar buildings, and has been recommended for public schools, to prevent the noise from the shuffling of the children's feet.

FELTRE', a town of Northern Italy, in the Venetian territory, is situated near the right bank of the Piave, 44 miles north-north-west of Venice. It suffered severely from the attacks of the Goths in the 5th century. The chief buildings are the cathedral, the college, ecclesiastical seminary, and gymnasium. F. has some trade in corn, wine, and oil. Pop. 6000.

FELU'CCA, a small class of vessel used in the Mediterranean. It is propelled by from 10 to 16 oars, and by lateen sails. It has frequently a rudder at each end, to be applied as occasion demands. During the French war, feluccas were armed with a heavy gun or two, and sent out as gun-boats against our ships, when becalmed off the Spanish ports; from their speed in smoo water, and the difficulty of hitting them, they w very troublesome antagonists.



FEMALE LABOUR is prohibited in mines collieries since 1st March 1843 (5 and 6 Vict. c. under heavy penalties. As to the limits un which it is permitted in factories, see FACTO ACTS.

FEMALE SHERIFF. There is only one insta on record of the office of sheriff in England hav been held by a female; this was in the case Anne, Countess of Pembroke. This lady, who distinguished during the rebellion in the reigns Charles I. and II. by her stanch adherence to royal cause, was the wife of Philip, fourth Earl Pembroke, and daughter of the Earl of Cumberla On the death of her father, without male issue, 1643, she succeeded to the hereditary office of she of Westmoreland, and in that character she atten the judges of assize, and sat with them on bench at Appleby.

FEMALE WHIPPING, as a public puni ment, was abolished by 57 Geo. III. c. 75; by 1 Geo. IV. c. 67, it was enacted that no fem offender should suffer the punishment of be whipped either publicly or privately; but imprisonment or solitary confinement should substituted therefor. See WHIPPING.

FEME COVERTE (*fœmina viro co-operta*). the language of the law of England, a woman her marriage becomes subject to her husband, has the control of her person, and is entitled to her residence. This control in the husband admitted to a certain extent in criminal cases excuse a married woman from guilt. Thus, in felony, except murder or manslaughter, commit by a married woman, in presence of her husba it is assumed that she acted under his compuls But this presumption may be rebutted by evide that she was the principal agent in the crime. married woman cannot, in criminal cases, be a wit for or against her husband, except when he is t for violence against her. In civil cases, a marr woman may be examined in a suit where her husb is a party. In a petition for divorce on the gro of adultery, a married woman is not a compet witness; but where cruelty forms one of the grou of complaint, she may be examined on that subj Her property is to a limited extent transferred the husband. Personal property, when it is quired by her own exertions, is deemed to be own separate property apart from her husband. 7 Will. IV. and 1 Vict. c. 26, even a will before marriage is revoked by the marriage. where a wife is deserted by her husband, she by 20 and 21 Vict. c. 85, s. 21, obtain an o protect any money she may acquire by industry. The landed property of a married is, during the marriage, under the administra the husband, and during their joint lives, h entitled to all the profits of the lands. Should be a child of the marriage born alive, and capa inheriting the lands, he has, by the Courtesy England (see COURTESY IN LAW), an estate for in all lands in which he is seised in fee in her Formerly, a married woman could not, during riage, execute a conveyance of lands without le ing a Fine (q. v.); but by 3 and 4 Will. IV. c. married woman may now make a disposition estate as if she were a *feme sole*. But the must concur in the deed, which must also be ledged by the wife, in presence of one of the master in Chancery, or of a commissioner under the act. Formerly, an action maintained by a married woman unless with the concurrence and in the name of the husband. A married woman may now maintain an action and other remedies in her own name, as regards her separate estate. A married woman cannot bind her husband by any contract she may enter into, but as he is bound to support her, he is liable for necessaries supplied to her while she lives with him, or if he wilfully deserts her, but not where she has left him of her own accord. Formerly, a wife could not obtain a divorce from her husband; but by 20 and 21 Vict. c. 85, she may now obtain a divorce on the ground of adultery, coupled with cruelty or desertion. See DIVORCE. For the law of Scotland in regard to the rights of married women, see MAN AND WIFE.

FEMERN, an island of Denmark, north-east of Holstein, and separated from it by a strait called the Femern Sound, has an area of 63 square miles, and a population of about 9000. The island is flat, fruitful, and destitute of wood. Agriculture, fisheries, and stocking-weaving for exportation, form the principal employments of the inhabitants. The chief town is Burg, which has about 2000 inhabitants.

FEMGERICHTE (derived from the old German *Fem*, punishment, and *Gericht*, court of justice), spoken of as the Holy Feme (or Fehme), and also known as the Westphalian or Secret Tribunals, were among the most remarkable phenomena of the middle ages, and supplied the place of the regular administration of justice, then in a deplorable condition. The origin of these courts has been ascribed to Charlemagne, who, it was pretended, had instituted them to prevent the relapse into Paganism of the Saxons who had been forcibly converted to Christianity. It is more probable, however, that they were a relic of the ancient German free courts of justice, the preservation of which may have been favoured in Westphalia by special circumstances.

When Henry the Lion was put under the ban of the empire, and deprived of his possessions in 1179, Westphalia, which then comprised nearly the whole district between the Rhine and the Weser, was granted to the Archbishop of Cologne; and from this time the secret tribunals gained in importance. In the general confusion which then prevailed in Germany, when all laws, both civil and ecclesiastical, had lost their authority, and the fabric of society seemed on the point of toppling into ruins, the Femgerichte were organised for the purpose of arresting and controlling the incipient anarchy that threatened to bring chaos back again, and of inspiring with feelings of salutary terror, through the agency of their mysterious powers and solemn judgments, all rapacious and lawless persons (but especially the feudal barons), who—on account of the impotence of the ordinary legal checks—committed crimes with impunity. In the causes, therefore, which led to their formation, and in their general design, the Femgerichte resemble the Hanseatic towns. They soon acquired tremendous influence, the emperors themselves having recourse to their assistance against powerful and rebellious nobles. It was in the 14th and 15th centuries, however, that they attained the summit of their dread authority, when they began to extend themselves over the whole of Germany. Beneficial as in many instances they proved to be, they could not fail, in the long-run, to degenerate, and to be frequently employed as a cloak to self-interest and malice. It is therefore by no means surprising that many voices were raised against them, and that in 1461 various princes and cities of Germany, as well as the Swiss confederates, formed unions for affording justice to every individual, and preventing any from seeking it from the secret tribunals. Particular classes likewise obtained imperial letters of protection against the pretensions of these tribunals. The emperors themselves, however, could go no further than to make some unavailing attempts to introduce improvements into the constitution of the Femgerichte, as the latter were bold enough to oppose the imperial authority, and even summoned the emperor Friedrich III. to appear before them. Their influence came to an end only when the public peace (*Landfriede*) was established in Germany, and an amended form of trial and penal judicature was introduced. The last real Femgericht was held at Celle, in Hanover, in the year 1568. A remnant of the institution, however, existed in Westphalia until the year 1811, at which time it was performing the function of a society for the suppression of vice, when it was abolished by an order of Jerome Bonaparte. Beyond the limits of Westphalia, notwithstanding all their endeavours, the Femgerichte never succeeded in fully establishing their authority; and even in the *Red Land*, as Westphalia was called (probably from the colour of the soil), they were restricted by the imperial privileges on which they founded their authority.

The members of the Feme were called *Wissende*, 'the knowing ones,' or the *initiated*. It was necessary that they should be born in wedlock, be of the Christian religion, lead a blameless life, and bind themselves by a tremendous oath 'to support the holy Feme, and to conceal it from wife and child, father and mother, sister and brother, fire and wind, from all that the sun shines on and the rain wets, and from all that is between heaven and earth.' Originally, none but an inhabitant of the 'Red Land,' possessed of real property, could be admitted a member of the Wissende; at a later period, this rule was relaxed. From the general body were elected officers called *Freischöffen* (free justices), who were assessors of the court, and executors of its sentences. The presiding judge was called the *Freigraf* (free count). The general superintendence and presidency of the secret tribunals belonged to the lord of the land (i. e., in Westphalia, to the Archbishop of Cologne). The highest office, however, as supreme president, was nominally held by the emperor, who was usually elected into the number of the Wissende on the occasion of his coronation at Aix la Chapelle. The court of a Freigraf was called *Freiding* (a free court of justice), and the place where he held court a *Freistuhl* (free bench or court). One of the most celebrated free courts had its seat at Dortmund. The sittings of the tribunal were either open or secret. The former were held by day in the open air, and decided in civil disputes; the secret tribunals took cognizance of those who had been unable to prove their innocence in the open courts, as well as of those who were accused of heresy, sorcery, rape, theft, robbery, or murder. The accusation was made by one of the Freischöffen, who declared, upon oath, that the accused had committed the crime. The citation was secretly affixed, with symbolical signs, to the door of the accused, who was to meet the Wissende at a certain hour and place, and be conducted by them before the tribunal. The accused could now clear himself by an oath, but the accuser and witnesses could oppose this with another. If the accused could now bring forward six witnesses to swear in his favour, the accuser could strengthen his oath with 14 witnesses; and it was not till after 21 witnesses had made their affidavit in his favour that sentence of acquittal necessarily followed. The persons convicted, as well as those who refused to obey the summons, were given over to the Freischöffen. The first Freischöffe who met him was bound to hang him on a tree, or, if he made any resistance, to put him otherwise to death. A knife was left by the corpse, to shew that it was not a murder, but a punishment inflicted by one of the Freischöffen. Compare Wigand, *Das Fehmgericht Westfalen's* (Hamm. 1825), and Usener, *Die Frei- und heimlichen Gerichte Westfalen's* (Frankfort, 1832).

FENCES, in Agriculture, serve the twofold purpose of enclosing animals on pasture-grounds, and of protecting land from straying animals. They are formed of a great variety of materials, and of very different structure. In countries where wood or stones are scarce, more especially where they have been long settled, hedges, formed of various kinds of plants, are common. These, when well kept and managed, give a clothed and picturesque appearance to the landscape. The hawthorn is the favourite hedge-plant in this country. See HEDGES.

When stones are used as fences, they are built as walls. The form and mode of building varies with the nature and quality of the stones, and the degree of taste and nicety required. Aberdeenshire forms its walls or dykes surrounding its fields with the granite boulders that are strewed over the surface of the country. The graywacke affords slaty stones, which give the walls their peculiar form in other parts, and so with the various kinds of sandstone.

In new countries, where wood is abundant, the fences are all of this material. The snake-fence, named from its zigzag form, is made by merely laying the ends of trees above each other, and requires no other means of fixing. As wood becomes more valuable, it is made into stobs and rails. The stobs are driven into the ground from two to three yards apart, and from four to five rails are nailed across, according to the purpose it is meant to serve. The stob and rafter fence is made by driving the stobs from three to four inches apart, and binding the whole by a rafter or rail nailed across the top. This is one of the strongest of wooden fences, but requires more material than the other.

Iron or wire fencing has come much into use of late. Vast stretches of waste land in this country, as well as pastures in Australia, have been enclosed by means of wire-fencing. Strong wires are stretched on posts firmly secured in the ground, from 100 to 200 yards or more apart. Intermediate or lighter posts are put in at from two to three yards' distance. After the wires are fully stretched, they are fixed to the smaller posts; when of wood, by means of staples, or threaded through, when of iron.

Law regarding Fences.—In England, it is held to be the duty of the occupier of lands to repair and uphold fences, and not of the landlord; and without any special agreement, the landlord may maintain an action against the tenant for not doing so. Though a tenant from year to year is not bound to put the fences and other buildings on his farm into repair, he must not do anything that amounts to waste, or to a breach of the rules of good husbandry. He cannot cut and sell hedgerows, or if he does so, he must make up the hedges and fences according to the course of good husbandry. 'If there be a quickset fence of white thorn, and the tenant shut it up, or suffer it to be destroyed, this is destruction; but cutting up quicksets is not waste, if it preserves the spring.'—Woodfall *On Landlord and Tenant*, pp. 456, 457, and cases cited. Where, in answer to a declaration against a tenant for not using premises in a husbandlike manner in repairing fences, on his implied obligation to do so, the tenant pleaded that the fence became out of repair by natural decay, and that there was no proper wood which he had a right to cut for repairing the fences, and that the plaintiff ought to have set out proper wood fo purpose of repairs, which he had neglected the plea was held to be bad, because it did n any request to the plaintiff so to do, or a the country in that respect.—Whitfield v. 2 Chit. 685. By 7 and 8 Geo. IV. c. 29, s. 23, the destruction of fences is declared to be able summarily with a fine of not more or in the case of a deer-park fence, with statute is limited to England.

In Scotland, the landlord is held bound to fences on the farm in due repair on the e tenant, independently of any stipulation in whilst the tenant must maintain them and le them, with the exception of ordinary tear and w in the state in which they were given over to h But the landlord is not entitled to increase burdens of his tenant by erecting new fences stipulated for, unless they be march-fences, which may be compelled to erect by contiguous propri and half the expense of which he must sha them, under the act 1661 c. 41, ratified by of the existence of which the tenant is presum have been aware when he entered to the farm. regards fences erected spontaneously by the ten the rule is that if, being entitled to remove he allows them to remain, he must leave the repair; but if they are Fixtures (q. v.), which h not entitled to remove, he is not bound to re them. It is optional to the landlord, at the mination of the lease, to order removal of fe and other buildings voluntarily built by the ten except in the case of palings and movable fr or to prevent their being removed without ing any indemnification.—Hunter, *Landlord Tenant*, ii. p. 208. As buildings, fences, and ameliorations made by the tenant, are supp to be made for his own sake, and not for the sa the landlord, he has no claim for the moneys w he may have expended for such purposes, at end of the lease; except under a special stipul to that effect. But if the tenant's occupation terminated abruptly, and more particularly if lease excludes assignees and sub-tenants, i equitable that the landlord, getting the be beyond what was contemplated by the tenant, family or the creditors of the latter should allowed a proportion of the value of the ame tions. Bell's *Princip.* s. 1255. The cases in w meliorations are or are not removable wil explained under FIXTURES (q. v.).

FENCIBLE, a word, of doubtful origin, ing defensive. Regiments raised for local d or at—and only for—a special crisis, used denominated 'Fencible.' In the last French the local, as distinguished from the general was called fencible, and many of the vol corps styled themselves the 'Royal — Fencible Infantry.' The only regiment of character still bearing the title is the ' Malta Fencible Artillery,' although the Rifle Regiment has also essentially the cha of fencible.

FENCING may be described, for a ge definition, as the art of defending one's own b or assailing another person's in fair fight by aid of a side-weapon—i. e., by a sword, rapier, bayonet. Technically, fencing is usually li to the second of these; and works on the touch only on attack and defence with the fo pastime, and the rapier in actual personal com The present opportunity will, however, be ta to introduce the elements of single combat w foil, sword, and bayonet. The objection form existed that instruction in fencing encouraged propensity to duelling; but as that absurdest of absurd customs has entirely ceased—at least in Britain—to demand its annual victims, no such objection now holds. Fencing may therefore be safely learned and taught as an elegant and manly accomplishment, developing gracefulness and activity, while it imparts suppleness to the limbs, strength to the muscles, and quickness to the eye. This regards fencing with the foils (the rapier has disappeared with the duels which employed it); but instruction in fencing with the sword and bayonet, while conferring the same advantages, has in addition the recommendation of helping to fit the student for taking an active part in any general national defence that political circumstances might render necessary. The Foil (q. v.) is a circular or polygonal bar of pliable and very highly tempered steel, mounted as any other sword, and blunted at point by a 'button,' to prevent danger in its use. m its nature, the foil can only be employed in sting, and, being edgeless, it can be handled out liability to cutting wounds. The length of blade should be proportioned to the height of person using it—31 inches being the medium for men, and 38 inches from hilt to point aximum allowable. As a protection against ental thrusts, the face is generally guarded wire-mask. The two portions of the blade known as the 'forte' and the 'feeble;' the extending from the hilt to the centre, and the from the centre to the point.

rawing, advance the right foot slightly to the take the scabbard with the left hand, raise ht elbow as high as the shoulder, seize the h right hand, nails turned inward, and having wn the foil, pass it with vivacity over the a semicircle, and bring it down to the (of which presently) with its point towards adversary, not higher than his face, nor lower his lowest rib. Simultaneously with the on being brought into position, the left hand fingers extended should be raised to a level the head, as a counterpoise in the various s to ensue. In establishing the position of the right foot must be advanced 24 inches the left, the heels in a straight line, and knee slightly bent, to impart elasticity to the vements, but not too much, lest the firmness of position be diminished.

fencing, there are three openings or entrances *inside*, comprising the whole breast from der to shoulder; *outside*, attackable by all the s made above the wrist on the outside of the d; and the *low parts*, embracing from the arm- to the hips. For reaching and guarding these ances, there are five positions of the wrist e, seconde, tierce, carte (quarte), and quinte. most important, and those to commence with, carte and tierce, from which are derived the ordinate positions of carte over the arm, low carte, and flanconnade or octave.

To engage is to cross swords with your adversary, pressing against his with sufficient force to prevent manœuvre taking you unawares. To disengage slip the point of your sword briskly under his e, and to raise it again on the other side, press- a direction opposite to that of the previous

guard in each position is a passive obstruc- to the opposing thrust; the parade is an active ruction, in which the guard is first assumed, the blade then pressed outward or inward by rn of the wrist against the adversary's sword, that when thrust at your body it shall be rted from its aim, and held off. The parade therefore be regarded as a mere extension of the guard. If the parade were called the 'parry,' it would convey its meaning more readily to English ears. Another, and perhaps more appropriate name for thrust, is the 'lunge' or 'longe,' as the thrust is almost always accompanied by a lunge forward of the right foot, to give at once greater force and longer command to the blow.

The following are directions for the principal guards and thrusts, which may also be seen depicted roughly in the sketches below.

Carte, Guard.—Turn wrist with nails upwards; hand on a line with lower part of breast; arm somewhat bent, and elbow inclined a little to the outside; point of foil elevated at an angle of about 15°, and directed at upper part of adversary's breast.

Thrust.—Being at the guard in carte, straighten the arm, raise the wrist above the head, drop the foil's point to a line with the adversary's breast, throw first the wrist, and then the whole body, forward by a lunge with the right foot of two feet from the 'guard,' the left foot remaining firm. The left hand should be dropped during the lunge to a level with the thigh, and to a position distant about a foot from the body; it will then afford a good counterpoise to the sword-arm. During the whole action, the body must be perfectly upright. When performed briskly, it appears that the point and foot are advanced simultaneously, but in fact the point has, or should have, priority, in order that the instantly following lunge may drive it home. Most of these observations concerning thrust in *carte* apply equally to all other thrusts.

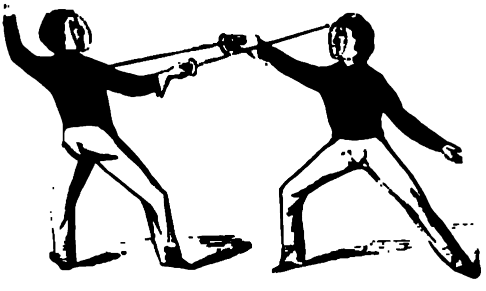


Fig. 1.—Carte.

Carte over the arm is a variety of this thrust. The sword is driven outside the adversary's blade, from the carte position, but in the tierce line.

Low Carte.—Engage adversary's blade in carte, then drop point under his wrist, in a line to his elbow, and thrust at his flank, the body being considerably bent.

Flanconnade or Octave.—Engage adversary's blade in carte, and bind it with yours, then carry your point behind his wrist and under his elbow: without quitting his blade, plunge your point to his flank.

Tierce, Guard.—As in carte, the nails and wrist being somewhat more downward, and the arm stretched a little outward, to cover the outside.

Parade.—Move arm, from the guard, obliquely downward to the right about six inches, and oppose the inside of the adversary's blade.

Thrust.—From the guard, turn wrist with nails downward, the same height as in carte, the inside of the arm in a line with the right temple; then thrust and lunge as in carte.

Seconde, Parade.—Nails and wrist downward, hand opposed outward, and blade, pointing low, about to form an angle of about 45° with the ground.

Thrust—The same as tierce, but delivered under the adversary's wrist and elbow, to a point between his right armpit and right breast: the body to be more bent than in carte or tierce.

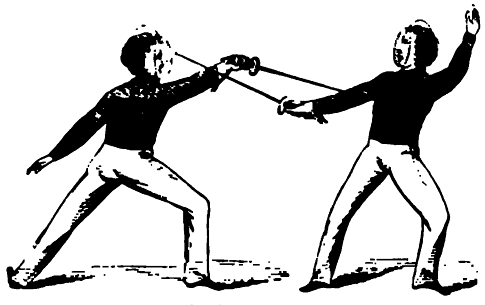

Fig. 2.—Tierce.

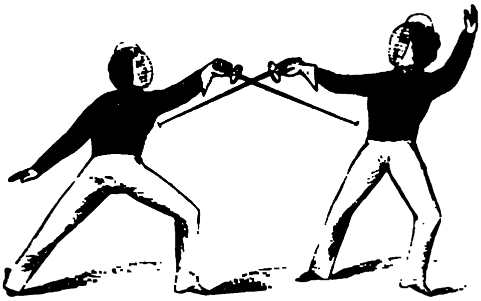

Fig. 3.—Seconde.

Prime, Parade.—In using prime to parry the thrust in seconde, pass your point over the adversary's blade, lower it to the waist, keeping your wrist as high as your mouth, nails downward, elbow bent, and body held back as far as possible. The left foot should also be drawn backward a few inches, to remove the body further from the hostile point.

Thrust.—An extension movement from the parade.

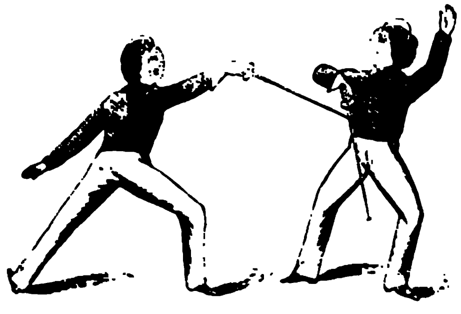

Fig. 4.—Prime.

Quinte, Parade.—Wrist in high carte, sword-point low, and oppose adversary from the forte of the outside edge of your blade.

Thrust.—Make a feint on the half-circle parade, with the wrist in carte; disengage your point over the adversary's blade, and thrust directly at his flank.

Half-circle, Parade.—One of the principal defensive parades: straighten arm, keep wrist in line with shoulder, nails up: by quick motion of sweep point from right to left in a circle cov

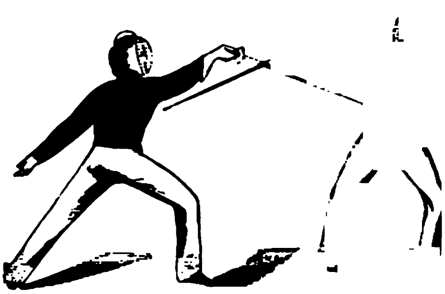

Fig. 5.—Quinte.

your body from head to knee, until the ad blade is found and opposition established.

The parades parry thrusts as follows:

Carte, with wrist low, parries low carte seconde; with wrist raised, all the thrusts o point on the inside of the sword and the flanc

Tierce parries high carte; with raised parries tierce.

Seconde parries all lower thrusts, both insid outside.

Half-circle parries carte, high carte, tierce seconde.

Prime parries carte, low carte, and seconde.

Quinte parries seconde and flanconnade.

In all parades or parries, care must be tal in covering the side attacked, the parade is wide as to expose the other side to the e steady countenance, shewing no disquietude attempt he may make, is, above all, neces parades.

Every parade has its return, which shou made with vivacity and decision. A thrust c returned when the adversary thrusts, or baffled in his attack, he is recovering to his In the first case, no lunge is necessary, the being made from the wrist: this return re great skill and quickness, since the adversary receive the thrust before, by finishing his has touched your body.

Ordinary Returns.—After carte parry, retu carte; after tierce, return in tierce; after pa high carte, return seconde; after parrying sec return in quinte; after parade in prime, seconde or low carte.

Feints, of which there are many varieties sist in threatening an attack on one side o sword, and then executing it on the other. best parade against a feint is that of the circle, which will be sure to find the adver point.

Advance and Retreat are motions of attac withdrawal, performed by advancing the rig withdrawing the left foot suddenly about 18 in and instantly following it with the other foot. the adversary advances, you must retreat, prepared to receive him at the sword-point.

Salute. The salute is a courteous opening o fencing, and consists in gracefully taking o hat, while, with the foils, your adversary and self measure your respective distances.

Appels or beats with the right foot, *beats* o adversary's blade, and *glissades* or glidings o sword along the other, are motions inten confuse the enemy, and give openings for th

Voltes, demi-voltes, and *disarming*, were ma formerly taught with care, but they are now discarded in the academies of England and France, as useless and undesirable.

In Spain and Italy, considerable differences of practice from that in France and England prevail. The left hand is used as an auxiliary in parrying, and in Italy is aided by a dagger, or sometimes a cloak. The Spaniard, though trusting to his sword and left hand only, has his blade five feet long, with sharp edges, his guard is nearly straight, and one of his favourite attacks is by a *cut* (not thrust) at the head.

In an article limited in length as this must necessarily be, it is impossible to give more than the merest outline of the various motions; but, of course, in actual practice, there are endless variations of the different modes of attack and defence, which will be severally adopted according to the skill and option of the fencer. There is no finer indoor exercise than fencing, as the muscles in every limb are developed and strengthened by it. The great requirements for success are a steady eye and hand, a quick purpose as quickly executed, and, perhaps above all, perfect equanimity of temper.

THE SWORD EXERCISE differs from fencing with the foil; in that, the weapon employed has one cutting edge as well as a point, and is therefore intended to cut and thrust. The sword is the arm of all officers in the army and navy, of many non-commissioned officers, and constitutes the sole mode of attack and defence for the officers of the British volunteers. A certain degree of proficiency in its use is therefore always serviceable. In practice, the usual substitute is a stout, straight stick, called a 'single-stick,' having a basket handle to protect the knuckles.

The position of the combatant is the same as assumed in fencing with the foil, the lunge is ar, as are also the 'advance' and 'retreat,' and r minor points. According to the instructions drill masters, there are seven cuts, with seven responding guards, and three thrusts. The ctical directions of all these are shewn on the accompanying diagram, which represents a target placed opposite a pupil, so that he may see the ms he is expected to perform displayed before The centre of the target is supposed to be in e with the centre of his breast.

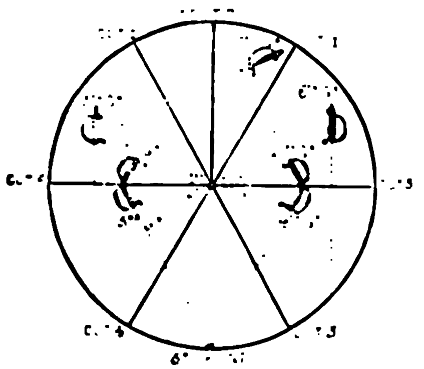

Fig. 6.

The cuts proceed from the circumference towards centre along the *thick* lines. Nos. 1, 3, and 5 are inside cuts, and attack the left cheek, left side, and inside of the right leg respectively; 2, 4, and 6 are outside cuts, attacking the enemy's right cheek, right side, and right leg on the outside. 7 is a vertical cut, aimed at the head.

The dotted lines shew the position of the sword in the several guards by which the cuts are opposed. The sword-handles illustrate the situation of the right hand with reference to the centre of the body.

The points or thrusts are shewn by the black circles. That towards No. 1 should be directed with the wrist and edge of the sword upwards to the right; towards 2, with the edge upwards to the left; and in the 3d point, with the wrist rising to the centre, and the edge upwards to the right.

The 'parry' is an additional defensive movement, and consists in bringing the wrist nearly to the right shoulder; whence, as centre, a circular sweep of the sword is made from left to right.

A considerable latitude is allowable in regard to the cuts, as to the part of the adversary's body at which they are directed, provided the general inclination of the blow be observed; similarly, the cut may at times be parried by a guard other than that intended specially for it, according to the discretion of the fencer.

In engaging, or joining swords, with the enemy, press the blades but lightly together, so that the hand and wrist may be readily susceptible of any motion. In making the guards, care must always be taken to receive, if possible, the feeble of the enemy's blade on the forte of your own, so as to offer the greater opposition. It should also be borne in mind that, in all cuts at the leg, when at proper distance, the shifting of your own leg, and delivering a cut at the same moment, becomes the most effectual and advantageous defence, particularly if you happen to be taller than your adversary, as you will then probably be out of his reach, while he is within yours.

In contending with bayonet or pike, the most effectual guard is the 5th, which, if well timed, enables the swordsman to seize the musket or pike with his left hand, and then make the 6th cut at his opponent's neck. In an encounter with the rapier, the best cuts are Nos. 3 and 4, as they attack the enemy's arm, which must be advanced within reach before he can touch your body, and also constitute a defence against his thrust. If the enemy—no matter how armed—be on horseback, the dismounted swordsman (provided he have proper nerve and agility) has decidedly the advantage. Endeavour to place yourself on his left, where he has less power of defending himself or his horse, and cannot reach to so great a distance as on his right: an attack on the horse will probably render it ungovernable, and it becomes easy then to avoid the rider's blows, while he himself may be attacked with impunity in almost any direction.

BAYONET EXERCISE. If the sword exercise be of use to volunteer officers, there are thirty times as many volunteers themselves to whom a proper command of the bayonet is indispensable. In close-quarter engagements, there is no weapon more formidable: from its length and weight, the thrust of the bayonet gives a terrible wound, and its force is such that there is great difficulty in parrying the attack. Like other small-arms, it is most serviceable when handled on scientific principles: and the art of using it to advantage is so simple as to be very easily acquired, while the exercise, from the weight of the rifle, admirably aids in developing the muscles of all parts of the body.

Of course, the bayonet is always fixed at the end of the musket, when it becomes virtually a pike. The position of the feet in the bayonet exercise remains always the same relatively, and absolutely until advance or retreat be effected. The right foot is thrown back 24 inches, and the weight of the body thrown upon it. The heels are kept in a line with each other, both knees bent and well apart: the right knee directly over the foot, the left easy and flexible, pointing to the front. In this position of the body, all the defensive motions of the bayonet are made. In 'guard,' the bayonet is brought nearly to a horizontal direction, level with the waist, and pointing towards the breast of an advancing enemy. Similarly, to 'guard,' the positions 'low,' 'high,' and 'second point' are assumed, the bayonet pointing as shewn by the dotted lines in fig. 7. The butt of the rifle is always kept well to the right side, the hand behind the trigger-guard, and the whole body in attitude to offer great resistance. In 'low,' the barrel is turned downwards; but in all the other defensive motions it is held upwards. The position of the arms is in each case that which would naturally be taken in placing the bayonet and musket in the required direction.

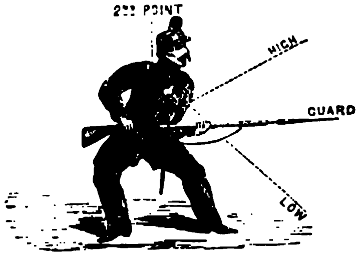

Fig. 7.

The offensive position of the body is acquired by the extension of the right leg, and bending forward of the left without moving the feet. The butt of the rifle is at the same time pressed firmly to the shoulder. This position is called 'point,' and constitutes an extension of the weapon in a direction parallel with either of those previously taken. As there were four 'guards,' so there are four points, which are shewn in fig. 8. The barrel is in each case upward, and the motions for each are similar, except in pointing from '2d point,' when the rifle, seized by the right hand round the small of the butt, is thrust straight up above the head to the full extent of the arm, the left hand falling along the thigh, and the legs being straightened so as to form an isosceles triangle.

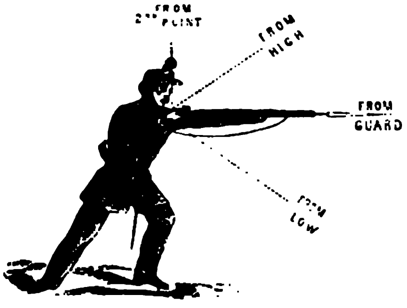

Fig. 8.

'Shorten arms' is a useful motion, both as a defence and as a preparation for a strong attack. It consists in carrying the butt back to the full extent of the right arm, while the barrel (downwards) rests upon the thick part of the left arm. The body is thrown upon the right leg, and the left straightened. This powerful position is seen in the annexed cut.

In all the guards and points, and also 'shorten arms,' the bayonet may be turned directly to the front, to the right, or to the left, as circumstances may suggest. In contending with a sword the action of changing from right to left, wh

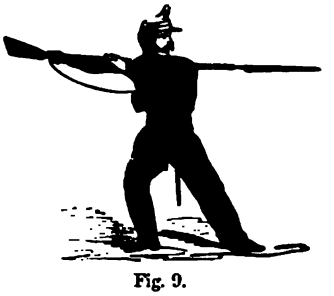

Fig. 9.

the 'high' or 'low,' is sufficient defence ordinary cuts of the latter.

Among the treatises consulted for t have been the works on fencing by A. Roland, as well as the shorter instructio by the military authorities.

FENELON, Francis de Salignac de la M was born, August 6, 1651, in the château province of Perigord, now included in the ment of the Dordogne, of a family which ha many celebrities both to the church and to the in France. His education was conducted at up to his 12th year, when he was transf Cahors, and afterwards to the Plessis Co Paris. At the close of a most blameless col career, he selected the church as his prof and entered, in his 20th year, the newly fo seminary of St Sulpice, then under the directi the celebrated Abbé Tronson, where he re holy orders in 1675. Unlike but too ma siastics of his own rank at that period, he whole heart to his sacred calling. For a after his ordination, he was employed in at the hospitals, and in other parochia the parish of St Sulpice; and in the he was named director of an instit founded for the reception of female co Roman Catholic faith, in Paris. During this office, he wrote his first work, *On the* *of Girls*, which is still a standard authorit the gentleness, moderation, and charity with he discharged his duties towards the yo verts, led to his appointment as head of a which, on the revocation of the Edict o in 1685, was sent to preach among the P population of Saintonge and Poitou. In resumed his duties in the Maison des Converties, at Paris; and in the following was named by Louis XIV. to the highly o post of preceptor of his grandson, the yo Burgundy. F.'s management of this mos and delicate trust shewed how well he the true nature and objects of educati own instructions, and all the exercises en his pupil, were so contrived, as, while the actual knowledge which it is the ness of a master to communicate, at the served to prepare the mind and the heart for what was to be the real business of impressing upon him a sense of the which awaited him, of the great princi and justice upon which these respo founded, and of the hollowness and earthly glory, power, and happiness, rest upon this foundation. To this wis the preceptor we are indebted for many popular in educational use; for the *Fa*

Dialogues of the Dead, for the *History of the Ancient Philosophers*, for the germ at least of the *Telemachus*, and for the *Life of Charlemagne*, the manuscript of which last work, unfortunately, was burned in the fire which destroyed the archiepiscopal palace of Cambray in the year 1697. As an acknowledgment of these great merits, he was presented by the king, in 1694, to the Abbey of St Valery, and in the following year, to the Archbishopric of Cambray, which he only accepted on the express condition, that for nine months of each year he should be exempted from all duties as preceptor of the prince, and left at liberty to devote himself exclusively to the care of his diocese. It is to this period of F.'s life that the history of the unhappy controversy about Quietism belongs. Without entering into the details of this singular revival of the ancient Mysticism (see MYSTICISM), it will be enough to say that two separate schools of Quietism to be distinguished, the moral character, or at the moral tendency, of which was exceedingly vent. See QUIETISM. In one of these, the mon mystic principle of the absorption of the in the love and contemplation of God, led to conclusion, that the soul, in this state of absorp became entirely passive; that it was thence independent of the external world; that it ed no contamination from the material actions outer man, and that no acts of virtue, not of prayer, were any longer required. See son. The other school, while it maintained the y of passive contemplation and love, yet repu d the dangerous and immoral consequences h were deduced therefrom. It was exclusively ter and less objectionable form of Quietism, professors of which for a time claimed, although patronage, yet at least the indulgent con on of Fenelon. He formed, in the year 1687, acquaintance of the celebrated Madame Guyon, may be regarded as the foundress of the French ol of Quietism. See GUYON. The extraordinary and exemplary life of this remarkable woman, his own natural bias towards the tender and spirituality which she professed, appear to have ed F. to the true nature and to the practical quences of the system which she followed. convinced of the unfairness of much of the y which was raised against her, and which made responsible for all the principles of the grosser tism of Molinos, his generous mind was perhaps cted to her cause by the very injustice of her ents. He advised her to submit her works to judgment of Bossuet, who was then in the zenith his fame, and with whom F. was in the most dly relations. In the condemnation of the book Madame Guyon by this prelate, F. acquiesced; but she made a formal submission to the church, refused to join in any condemnation of herself nally. Nevertheless, when a commission was inted to examine the whole affair, F., although a member, took a part in the proceedings; and even suggested certain changes in their report, h he subscribed in common with the rest. To articles prescribed for her signature by this com n, Madame Guyon readily subscribed; but it rther considered necessary not only to publish demnation of her several works, but also to a special exposition of the true doctrine of rch on these questions. When the work of on this subject was completed, he submitted for his approval. This F. not only refused e, but even composed his own *Maxims of the* in *the Interior Life*, in explanation and defence at least of Madame Guyon's doctrines. ted his book to the Archbishop of Paris, introduced into it some modifications which were suggested by the diocesan censors, cheerfully agreeing to the stipulation of the archbishop, that it should be kept back from publication until the completion of the rival treatise of Bossuet, *On the States of Prayer*. An unfortunate violation of this engagement, committed without the knowledge, and in the absence of F., was the last of a long train of causes which led to the painful and disedifying rupture between these two great prelates. F.'s book was received with much clamour, that of Bossuet was universally approved; and in the controversy which ensued, all the weight of the displeasure of the court, which F. had provoked by the covert strictures upon the existing state of things, in which he was believed to have indulged in his works of fiction, was brought to bear against him. He was ordered to submit his book to the judgment of an ecclesiastical tribunal, of which Bossuet was a member. F. refused to accept Bossuet as judge, on the ground that he had already prejudged the cause; and in the end he appealed to the judgment of the holy see. Unfortunately, even while the affair was pending at Rome, the controversy was still maintained in France. Bossuet published a succession of pamphlets. Several of the bishops who had espoused the side of Bossuet, issued pastorals in the same sense. F. defended himself vigorously against them all in several publications, explanatory as well of his principles as of the personal imputations in which some of his adversaries did not scruple to indulge. The last blow against the ancient friendship of the great rivals was struck by Bossuet in his celebrated *Relation sur le Quiétisme*. F. was wounded to the heart. The copy of Bossuet's pamphlet which first came into his hands is still preserved in the British Museum; and the margin is literally filled with remarks, annotations, replies, denials, and rejoinders, in the singularly delicate and beautiful handwriting of the indignant archbishop. The copy now in the British Museum is most probably one which, as we learn from his correspondence, he sent to his agent at Rome, and on the margin of which he corrected, for the guidance of his friend, the many false and exaggerated charges of his great antagonist. The substance of these replies he gave to the public in a most masterly defence, written, printed, and published within little more than a fortnight from the appearance of Bossuet's *Relation*. From this point, the controversy assumed a more personal, and therefore a more acrimonious character; and it was maintained on both sides till the long delayed decision of the pope brought it to a close, March 12, 1699, by a brief, in the usual form, condemning the *Maxims of the Saints*, and marking with especial censure 23 propositions extracted from it. The conduct of F. under this blow constitutes, in the eyes of his fellow-churchmen, one of his highest titles to glory. He not only accepted, without hesitation, the decision of Rome, but he took the very earliest occasion to publish from his own pulpit the brief of his condemnation; he issued a pastoral address to his flock, to apprise them of the judgment of Rome, and of his own cheerful acquiescence; and he presented to his cathedral a magnificent piece of church-plate, a gold ostensory, in which the Angel of Truth is represented trampling under foot many erroneous works, the most prominent of which bears the title of *Maxims of the Saints!* Bossuet is said to have been greatly touched by the conduct of his noble adversary, and to have earnestly desired a reconciliation. But the adverse influence of the king, Louis XIV., and of the court, stood in the way. The jealousy with which the political principles of F. were already regarded was heightened about this time into open hostility by the appearance of his *Telemachus*, which was printed from a copy surreptitiously obtained by [illegible] regarded as but a [illegible] Sesostris being [illegible] Monarque himself [illegible] Montespan; Protesilaus, [illegible] Mademoiselle de Fontanges. [illegible] F. was strictly [illegible] measures were taken [illegible] every character [illegible] him most of all, [illegible] whether personal or by [illegible] and much-loved [illegible] Burgundy. From this date, F. [illegible] He founded at [illegible] his archdiocese, which he [illegible] He was assiduous in [illegible] discharge of the other duties [illegible] and the fame of his benevolence, [illegible] liberality is attested by [illegible] the campaign of 1709 to spare the [illegible] the Archbishop of Cambray. [illegible] controversy in which he appears is [illegible] Jansenistic dispute in the well-[illegible] 'The Case of Conscience' (see JAN-[illegible] F. engaged earnestly on the side [illegible] Notwithstanding the prohibition of [illegible] the young Duke of Burgundy [illegible] affection for his preceptor; and [illegible] hopes were entertained as to the future [illegible] of such a school. These hopes [illegible] cut short by the premature death [illegible] 1712. F. survived him but a short [illegible] 7, 1715.

[illegible] F. are very voluminous. [illegible] a genus of [illegible] resembling foxes in [illegible] but having eyes adapted for diurnal and not for nocturnal vi remarkably large ears. The species are beautiful. They feed partly on dates an vegetable food, also on eggs, and on insect they adroitly snap as they pass.

FENNEL (*Fœniculum*), a genus of umbe plants, allied to Dill (q. v.), but distinguishe cylindrical strongly ribbed fruit. The flo yellow. All the species are aromatic, a much divided leaves with thread-like segmen best known is the COMMON F. (*F. vulgare*, of the south of Europe and of some parts of It is a biennial, three or four feet high, and vated in gardens, chiefly for the sake of its which are boiled, and served up with macker salmon, and occasionally with other kinds of are employed to form a sauce for them.—Sw ITALIAN F., or CRETAN F. (*F. dulce*), is a much humbler growth, and annual, much cul in the south of Europe, but too tender for the of Britain. The young sprouts from the r sweeter and less aromatic than those of Com

Fennel (*Fœniculum vulgare*): *a*, a flower.

and when blanched, are a very agreeable sal potherb. The fruit (seed) is longer and pale that of Common F., has a more agreeable odo flavour, is the favourite aromatic condiment of Italians, and is used in medicine as a carm and aromatic stimulant. *Oil of F.*, an a stimulant, and carminative essential oil, is ob from it. CAPE F. (*F. Capense*), found in the of the Cape of Good Hope, has a thick, a esculent root. The PANMUHOOREE of In *panmorium*) is a species of F. much cultivated i native country for its sweet, warm, and a fruit, which is much used as a carminative, curries.—The GIANT F. of the south of Euro plant of a different genus (*Ferula*), and in a fetid juice. It is indeed closely asafœtida, but forms a favourite food of the Apulia, where it particularly abounds. dead stem is full of a white pith, which is Sicily as tinder.

FENS. See BEDFORD LEVEL.

FENUGREEK (*Trigonella*), a genus of p the natural order *Papilionaceæ*, sub-order *Leg* *cæ*, allied to clover and melilot. The leaves l three obovate leaflets and scythe-shaped stipules. The flowers generally have the *keel* very small, so that the *wings* and *standard* present the appearance of a tripetalous corolla. The COMMON F. (*T. fœnum Græcum*) is a native of the south of Europe, and of some parts of Asia; it is much cultivated in India as a fodder-plant, and derives its name (*Fœnum Græcum*, Greek hay) from its use as fodder in Greece.

Fenugreek (*Trigonella fœnum Græcum*).

ods are many seeded, and cylindrical; its seeds e a strong peculiar smell, and an oily bitter taste; flour made from them is used for emollient es, but only in veterinary practice. The of F. were formerly held in great esteem in dicine.—Another species (*T. incisum*), growing staneously in many parts of India, is much used odder for cattle. The legumes of the ESCULENT ONELLA (*T. esculenta*), also an Indian plant, are as human food. One species only, the BIRD'S F. (*T. ornithopodioides*), is a native of Britain, ll plant, growing in sandy pastures near the ad not very common.

YES, ELEK (Alexius), a Hungarian geo- and statistical author, was born in 1807 at , in the county of Bihar. After the usual of studies in philosophy and law, F. became r-at-law as early as 1829; but instead of ating the law-courts, he began travelling all the country, with the purpose of making thoroughly acquainted with the state of arian kingdom, of which there had never en an authentic survey. The first fruits 's enterprise appeared in 1840, under the title, *ry and its Annexed Parts, Geographically tatistically considered* (6 vols., Pesth). The prize of 200 ducats was awarded to the by the Hungarian Academy. *The Statistics ngary*, in 3 vols., followed (1843); *General for Hungary* (1845); *Description of Hungary* ; *Geographical Dictionary of Hungary* (1851) of which were published at Pesth. The of F.'s works are written in the Magyar e, but several of them have been translated German, and repeatedly published. Besides these works are the first true expounders of state of Hungary, it is also generally admitted as to their completeness, solidity, and exactness, they will bear a comparison with the best of kindred works in European literature. During the national government of Hungary (1848), F. was made the chief of the statistical section. After a respite of several years, from failing health, F. is again busily engaged in the periodical press, and is editor of the *Farmers' Journal* (A Falusi Gazda).

FEODO'SIA, or **THEODO'SIA**. See KAFFA.

FEO'FFMENT (*infeudare*), the oldest, and for a long period the only, method for the conveyance of land known in England. Feoffment consisted in the formal conveyance of the land from the feoffer to the feoffee, the former stating distinctly the measure of the estate conferred, whether it was in fee, in tail, or for life. Where no mention of the duration of the estate was made, the gift was presumed to be for life. This conveyance of the land, in order to be complete, required to be accompanied by delivery of Sasine (q. v.). Livery of sasine was of two kinds—viz., by deed, and in law. In the former case, the parties being actually upon the land, the feoffor, by delivery of a twig or a turf, testified his conveyance of the land. In livery in law, the parties being in sight of the land, the feoffor referring to the land gave possession to the feoffee. This mode of feoffment was ineffectual unless the feoffee entered into possession during the life of the feoffor. Livery in deed might be effected by attorney; but livery in law only by the parties themselves. In the earliest times, these ceremonies completed the conveyance. But by degrees the practice of embodying the transaction in a deed was introduced. When a deed was used, it became customary, but not essential, to endorse on the deed the fact that livery of sasine had been made. By the statute of Frauds (29 Car. II. c. 3), it was declared that no estate created by livery of sasine, unless accompanied by writing, signed by the party or his agent, should be of any effect, except as an estate at will; and by 8 and 9 Vict. c. 106, s. 3, a feoffment is void unless accompanied by deed. The law formerly gave so great an effect to a feoffment, that even when the party ostensibly making the conveyance was not lawfully seised in the estate, the feoffment was sustained. This was called a tortious conveyance; the party in whose favour it was made was said to have acquired an estate by wrong, the rightful owner was disseised, and was left to his right of Entry (q. v.). But by the act last mentioned, this tortious effect of a feoffment was removed. It must be observed that the practice of feoffment above described, and which has existed in England from time immemorial, differed materially from the old form of investiture in use in strictly feudal times, and from that which still prevails in Scotland. In England, the transaction was simply a conveyance by the actual holder of the land to a new tenant, testified by certain ceremonies, but requiring no confirmation by a third party to complete it. But by feudal usages, every holder of land was the vassal of some superior lord, to whom he owed suit and service, and without whose consent he could not even part with his land; hence no conveyance was complete without the reception of the new tenant by the lord paramount as his vassal. In like manner, to this day, in Scotland, no transfer of heritage is complete without the formal confirmation of the superior; and although by recent legislation the old feudal usages, which for two centuries have existed as landmarks, telling us of a system now passed away, have been abolished, yet the fact of acceptance by the superior, and the performance of the pecuniary services attendant on that acceptance, are still preserved. See INFEFTMENT, SASINE, FEUDAL SYSTEM.

Feoffment to Uses.—This was an application of the feudal form of *feoffment* in England in order to effect a conveyance in trust. The common law courts, adhering to feudal rules, refused to recognise any interest in the land but that of the person actually infeft; but where a feoffment was made to one man *to the use* of another, the equity courts gave effect to the transaction by compelling the party infeft to hold in trust for the third person, called the *cestui que use*, who was said to have an equitable estate, in contradistinction to the legal estate which remained in the feoffee to uses. By the statute of Uses, it was enacted that in all such conveyances the actual legal estate should pass to the *cestui que use*. See USES.

FER OLIGISTE is a mineralogical term applied to a variety of anhydrous red oxide of iron (Fe_2O_3), otherwise called *Specular Iron Ore*. The famous Swedish, Russian, and Elba iron are in greater part prepared from this iron ore. The natural position of fer oligiste is in the primary rocks. See IRON.

FE'RÆ (Lat. *ferus*, wild), in the Linnæan system of zoology, an order of *Mammalia*, nearly corresponding to the *Carnaria* (q. v.) of Cuvier.

FE'RÆ NATU'RÆ (Lat. of a wild nature). Those animals which flee the dominion of man, whether beast, bird, or fish, and retain their natural freedom, are thus characterised in the Roman law. According to that system, such animals became the property of any one who might catch them, irrespectively of the ownership of the soil on which they were taken, on the principle that 'natural reason gives to the first occupant that which has no owner.' —*Inst.* ii. tit. i. s. 12. But this regulation did not prevent the prohibition of trespass. 'Of course, any one who enters the ground of another for the purpose of hunting or fowling, may be prohibited by the proprietor, if he perceives his intention of entering' (*Ib.*). This right on the part of the proprietor did not affect the property of the animal taken, though it gave him an action against the trespasser. If a wild animal escaped from its captor, his proprietorship instantly ceased, and the animal might again be appropriated by its captor. This occurred even though the animal was not out of sight, if it could not be pursued without great difficulty. Even a wounded animal was not the property of the sportsman till it was caught, though the point which is decided in this sense (*Inst.* ii. tit. i. s. 13) is said to have been one on which difference of opinion had prevailed. Except in so far as it is modified by the statutes, which will be explained under GAME-LAWS, these provisions form part of the common law both of England and Scotland. Animals which are said to be feræ naturæ, or of a wild and untamable disposition, any man may seize upon and keep for his own use or pleasure; but if they escape from his custody, though without his voluntary abandonment, it naturally follows that they return to the common stock, and any man else has an equal right to seize and enjoy them afterwards (Stephen's *Blackstone*, i. 161). The law of Scotland followed the law of Rome so closely in this, as in other respects, that the passage from the *Institutes* of Justinian above referred to was translated into one of the oldest collections of Scottish laws—that, viz., contained in the Cromertie MS., the date of which may be assigned to the latter part of the 14th c., and which certainly is not later than the reign of Robert III. (Irvine's *Game-laws*, p. 20, and statutes published by the Record Commission, Appendix v. p. 385); see also Stair, ii. 1. 5, and 33; and Ersk. ii. 1. 10. Under animals, feræ naturæ, the law of Rome included *bees*, unless included in a hive, or *skep*, as it is still called in Scotland, or unless the proprietor be in pursuit of them, and has k in sight. See BEE. Domestic animals, th stray, do not cease to be the property of whom they have belonged; but as regard which have a tendency to return to a nature, the rule of the Roman law property in them continued so long as the intention of returning (*animum rever* rather, one would imagine, the habit of This rule applied to peacocks and pigeon to fowls and geese; with reference to wh provided, that though they should be frigh take to flight, they were still yours, th might have lost sight of them, and that detained them with a view to his own guilty of theft. See DOVECOT, WARREN FISH.

FE'RDINAND I., emperor of Germ —1564, was born in Spain, 1503. He son of Philip I., and brother of Charles he succeeded in the empire in 1556, ha previously elected king of Rome. F. had in 1521, Anna, daughter of Ladislaus VI Bohemia and Hungary. When her brot fell in 1526 in battle with the Turks, l issue, the crown was claimed by F. in his wife. This involved him in a long a struggle with a rival, John of Zapolya, claim to Hungary, and who, as well a Sigismund, was supported by Soliman, the Turks. F. at last gained the up bought off the Turks by a yearly tribute, secured Hungary and Bohemia to the Austria. When he was elected emperor, cessions he had made to the Protestan the pope, Paul IV., to refuse to acknowl That pope dying, his successor, Pius IV., complaisant; but the electors resolved the future the consent of the pope shou asked; and this was carried out. F. ma attempts to reconcile the Protestants and and urged, though fruitlessly, the refo abuses on the Council of Trent. He di leaving the reputation of a prudent and e ruler, and was succeeded by his son, Ma

FERDINAND II., emperor of Germ —1637, was born at Gratz, 9th July I was grandson of Ferdinand I., his fath Charles, Archduke of Styria, the young of Maximilian. F.'s mother, Maria of early inspired him with hatred against th ants. He was educated by the Jesuits stadt, along with Maximilian of Bavaria Loretto, he had taken a solemn oath, b altar of the Mother of God, to reinstate Ca as the sole religion of his dominions, at As soon as he succeeded to the governm own duchy of Styria, he set about putti Protestantism by force. He attempted th Bohemia and Hungary, of which countri been elected king during the lifetime of Corvinus; but though at first unsuccessful in danger of losing his dominions, he managed, with the aid of the Catholic l of the Elector George I. of Saxony, to them. Bohemia lost all its privileges. By confiscation of property, and the banish innumerable families, the wretched land was to obedience; and the introduction of the and rigorous persecution of Protestants, lished Catholicism. Meanwhile, F. had bee emperor of Germany (1619). The w properly ended with the subjugation of was at the same time transferred to th Germany, and took the character of a

-the famous 'Thirty Years' War' (q. v.). The
rial generals, Tilly and Wallenstein, were
by a confederacy of the Protestant states
wer Saxony, with Christian IV. of Denmark
eir head; but the confederates were defeated
lly at the battle of Lutter, in Brunswick, and
l to conclude peace (Lubeck, 1629). Confident
e ascendency which he had acquired, F., in
ame year, issued an Edict of Restitution for
whole of Germany, taking away from the
stants nearly all the rights they had acquired
century of struggles; and the troops of Wal-
in and of the league were immediately set
rk to carry it out in several places. But
r proceedings were soon arrested by the
sal of Wallenstein, on which the diet of the
at Regensburg had insisted; and by the

dlingen, which had the effect of detaching
y from the Swedish alliance; but the ability
Swedish generals, for whom Austria had
that were a match, and the open part that
e now took in the contest, brought back the
e of victory so far to the Protestant arms,
hen F. died, February 15, 1637, he had given
hope of ever attaining his objects. His
s one of the most disastrous in history; for
ny owes him nothing but bloodshed, and
and desolation.

INAND III., emperor of Germany, 1637—
son of Ferdinand II., was born 11th July
was not so much under Jesuitical and
nfluence as his father. Having accom-
armies in their campaigns after the
llenstein, he had witnessed the miseries
n was inclined for peace; but the con-
erests of the individual belligerents
r unity of view, and made it necessary
with the contest. Thus was this miser-
rotracted, ever extending in circuit, and
in devastation owing to the growing
s of the soldiery. At last, in 1643, a
at Münster to arrange terms of peace,
ncluded in 1648, and is known as the
stphalia. At the diet of the empire,
, the last presided over by an emperor
F. effected important alterations in the
ion of justice. He died, 2d April 1657,
r concluding an alliance with Poland
eden. His son, Leopold I., succeeded
German empire.

INAND I., emperor of Austria (1835-
lest son of Francis I. by his second marriage
Theresa of the House of Naples, was
enna, 19th April 1793. He was from
a weak constitution, and was unfortunate

was fostered by the example of his uncle, the
Charles, to whom he was much attached.
wn-prince, he travelled through his Italian
, Switzerland, and part of France, and
t interest in manufacturing industry. In
o succeeded his father on the throne. It
xpected from his character that he would
rate a more liberal policy than his prede-
had pursued, but the absolute principles
em destined to rule for ever the Austrian

cabinet, triumphed, and Metternich was allowed to carry on the government. It now became obvious that F. sadly lacked moral decision, and his 'goodness' exhausted itself in numerous acts of clemency and benevolence. Nevertheless, during his reign, the industry of Austria made a great advance, and the great network of railroads and highways was begun. The insurrection in Galicia, 1846, led to the annexation of Cracow to Austria. No country was more affected by the European movement that began in the winter of 1847–1848 than Austria, though the revolutionary storms that shook the empire cannot be attributed to any want of goodwill to his people on the part of Ferdinand, but only to a complete want of political wisdom. On the disturbances breaking out in March, he consented to the dismissal of Metternich, the appointment of a responsible ministry, and granted the outlines of a constitution. In May, he retired with his court to Innspruck, but was induced to return to the capital in August. At last, the October insurrection in Vienna made him again leave the palace of Schönbrunn, and retire to Olmütz, where, on 2d December 1848, he abdicated in favour of his nephew, Franz Joseph. He has since resided at Prague. He married, 27th February 1831, Caroline, daughter of Victor Emanuel I., king of Sardinia, but has no children.

FERDINAND THE CATHOLIC, 5th of Castile, 2d of Aragon, 3d of Naples, and 2d of Sicily, was born 10th March 1452. He was the son of John II., king of Navarre and Aragon; and in 1469 married, at Valladolid, Isabella, sister of Henry IV. of Castile. Even in the lifetime of his father, events were paving the way for the subsequent union of the two kingdoms of Castile and Aragon. On the death of Henry IV. of Castile in 1474, the Cortes refused to acknowledge the legitimacy of his daughter Juana, and proclaimed Isabella and her husband F. joint-sovereigns. A war ensued, in which they were completely successful. In 1479, F. becoming king of Aragon on the death of his father, the two kingdoms of Aragon and Castile were united in the persons of F. and Isabella. Isabella, however, as long as she lived, maintained her position as queen of Castile, and allowed her husband no other share in the government than the privilege of affixing his signature to the decrees, and of uniting his arms with her own. F.'s whole reign was an uninterrupted series of successful wars. In Castile, he distinguished himself by the effectual suppression of the banditti, who had become formidable in the confusion resulting from the civil wars. This he accomplished by re-organising and putting in force against them the *hermandad*, or brotherhood, a kind of Spanish militia, composed of the citizens and the country-people. But F., whose craft and vigour were quite Machiavelian, was not content with taking strong measures against the Castilian outlaws; he also resolved to break the power of the feudal nobility, and made good use of the *hermandad* in carrying out this design. Cities and towns were encouraged to make themselves independent of the nobles, who were deprived of many important privileges. Among other humiliations, they were subjected to the ordinary tribunals of justice. The establishment of the Inquisition in 1478–1480, although primarily and mainly intended to further 'religious' ends, likewise helped to lessen their influence. F. also strengthened his power by vesting in himself and his successors the grand-mastership of the military orders of Calatrava, Alcantara, and Santiago. In all his schemes, F. was ably seconded by his queen Isabella, and by the celebrated Cardinal Ximenes. The year 1492 was the most brilliant in his reign, and is one of the most important in the history of the material progress of the world. It was signalised by the discovery of America by Christopher Columbus, though the honour of having aided the great navigator belongs not to F., but to Isabella. The same year witnessed the capture of Granada, and the retreat of the last Moorish monarch into Africa. F., who had a true Spanish hatred of heresy, immediately issued an order for the expulsion of the Jews from the conquered kingdom; and, in consequence, 160,000—some say 800,000—of his new subjects were compelled to scatter themselves over Europe. This act was neither wise nor Christian, but it was in accordance with the religious barbarism of the age, and especially of Spain. It was followed, several years after, by the persecution and expulsion of the Moors—an act still more unwise than the former, for the Moors of Granada were unquestionably the most industrious, civilised, and refined inhabitants of the Peninsula. F. was as successful abroad as at home. He was victorious over Alfonso V., king of Portugal; while his general, Gonzalvo de Cordova, twice wrested Naples from the French—the second time in 1503—after which it remained permanently in F.'s possession. In the following year, Isabella died; and in 1505, he married Germaine de Foix, a niece of Louis XII. of France. He took part in the famous league of Cambrai formed against Venice in 1508; made himself master of various towns and fortresses in Africa; and in 1512, conquered the kingdom of Navarre; thus becoming monarch of Spain from the Pyrenees to the Rock of Gibraltar. He died at Madrigalejo, January 23, 1516; and was succeeded by his grandson, Charles V. To F. and Isabella Spain owes her unity and greatness as a nation; and, in the no less skilful hands of their successor, she exercised an imperial influence over Europe, which it required Luther and the Reformation to check. See Prescott's *History of the Reign of Ferdinand and Isabella of Spain* (1838).

FERDINAND VII., king of Spain, born 14th October 1784, was the son of King Charles IV. and the Princess Maria Louisa of Parma. Although he had the advantage of excellent preceptors, especially the Canon Escoiquiz, in his youth, yet the machinations of the notorious Godoy, minister of Spain, prevented him from enjoying any opportunities for the intelligent exercise of his faculties. A deliberate attempt was made by his mother and Godoy to degrade him into a lover of mere animal pleasures, that their influence and authority might be unrestrained. F. soon conceived an aversion to the minister, which was increased by his marriage in 1802 with the amiable and accomplished Maria Antoinetta Theresa, daughter of Ferdinand I., king of the Two Sicilies. This lady, who endeavoured to maintain her husband's dignity, died, 21st May 1806, of grief, as is supposed, at the insults offered to her by Godoy, the king himself, and above all by the queen. Suspicions of foul play, however, were entertained by Ferdinand. Mainly for the purpose of gratifying their hatred towards Godoy, a number of the nobles, headed by the Duke of Infantado, assembled round the crown-prince. A false step that the latter now took proved the beginning of great misery to Spain. By the advice of the Canon Escoiquiz, he wrote a letter to Napoleon, in which he expressed a wish to marry the eldest daughter of Lucien Bonaparte. This letter fell into the hands of the minister himself, and the prince was in consequence arrested in the Escorial, 28th October 1807, and declared a traitor by a royal proclamation, written in Godoy's own hand, and addressed to the Council of Castile. The animosity of the people towards the minister led to the revolution
of Aranjuez, and the king abdicated in
F., 19th March 1808. Almost immediate
however, Charles wrote to Napoleon, decl
abdication to be forced. Napoleon, who had d

He, however, the Jesuits, and abolished superfluous con- cts that may, perhaps, partly atone for his persecution of the republicans in 1800, and ral antipathy to enlightened principles of nt. He died January 4, 1825; and was by his son Francis I., who died in 1830.

DINAND II., king of the Two Sicilies, son of Francis I. by his second wife, Maria of Spain, and was born 12th 1810. He succeeded his father in 1830. ntry was in the most wretched condition; eyes were turned to the young king, ning of whose reign was marked by ts of clemency towards political enemies, by the introduction of reforms in the and government of the country. But it long before he began to listen to foreign ch saw danger for the whole peninsula sures. From that time, Naples became of incessant conspiracy, insurrection, and political prosecutions. Ferdinand to the storm of 1848, and granted a consti- both parts of his dominions; he was even take part in the war against Austria in Italy. The Sicilians mistrusted, and with king's proceedings, and declared that he amily had forfeited the Sicilian crown. red the constitution so far as to call the together, but quickly dismissed them, t of any interference with his authority. subjugation of Sicily in 1849, when the began to set in all over Italy, he hastened ly to set aside the new constitution; while had taken any part in state reforms bjected to those cruel persecutions that the of Mr Gladstone have held up to the execra- the world. F. died 22d May 1859, and was d by his son Francis II.

DINAND III., Grand Duke of Tuscany, chduke of Austria, was born at Florence, y 1769. In 1790, he succeeded his father, II., in the government of Tuscany, when r obtained the imperial throne at the death mperor Joseph II., Leopold's brother. F.'s Tuscany was one of combined mildness ity; and during his reign were inaugurated dicial, economical, and legislative reforms: e was protected and encouraged, hospitals lums founded, good roads opened through e, and the greatest attention bestowed on fare of his subjects, which an enlightened l prince could exercise. A lover of peaceful he remained strictly neutral in the first coalition against France, and was the first sovereign in Europe to recognise and treat diplomatically with the French Republic in 1792. In 1793, intimidated by the combined menaces of the Russian and British cabinets, F. was constrained to relinquish his neutral policy, and become a passive member of the coalition formed by the above governments against France. In 1795, on the French occupation of Piedmont, he speedily reassumed friendly relations with France. In 1797, in order to save his states from annexation to the Cisalpine Republic, F. concluded a treaty with Bonaparte on most unfavourable terms; undertaking to pay a war-levy to France, and to transfer to the Museum of Paris some of the chief master-pieces of the Florentine galleries, including the 'Venus de' Medici.' Owing to the continued intrigues of France in his states, F. was forced to seek an Austrian alliance, which furnished Bonaparte with a pretext for declaring war simultaneously against Austria and Tuscany. In 1799, F. retired to Vienna, leaving the French troops in occupation of Tuscany. In 1801, at the peace of Lunéville, he was forced to renounce all claim on Tuscany. In 1814, the peace of Paris reinstated him in Tuscany, and even restored his artistic treasures. He died 17th June 1824, leaving his states to his son Leopold II.

FERENTINO, a town of Italy, in the former delegation of Frosinone, and 6 m. N.W. of the town of that name. Portions of the ancient walls, built in the cyclopean style of large irregular and polygonal blocks of limestone, and patched or surmounted with Roman masonry, no mortar having been used, are still extant. F. is the ancient Ferentinum, a city of the Hernici. Present pop. 8300.

FERGUSON, ADAM, a Scottish philosopher and historian, was born (1724) at Logierait, in Perthshire, where his father was parish minister. He studied at the universities of St Andrews and Edinburgh, and was appointed (1744) chaplain to the 42d Regiment, in which capacity he was present at the battle of Fontenoy, and is said to have charged the enemy sword in hand, among the foremost of the regiment. In 1757, he succeeded David Hume as keeper of the Advocates' Library in Edinburgh. He was next appointed professor in the Edinburgh University, first of natural philosophy, in 1759, and subsequently (1764), of moral philosophy—a subject which had always had great attractions for him. While holding this office, he accompanied the young Earl of Chesterfield (1774) on his travels on the continent; and in 1778–1779, he acted as secretary to the commission sent out by Lord North to try to arrange the disputes between the North American colonies and the mother-country. The state of his health induced him, in 1784, to resign his professorship, in which he was succeeded by Dugald Stewart. In 1793, he visited various parts of the continent; and on his return, took up his residence for some time at Neidpath Castle, in Tweeddale, and latterly in St Andrews, where he died, 22d February 1816. His chief works are—*Essay on the History of Civil Society* (Lond. 1767), *Institutes of Moral Philosophy* (Lond. 1769), *History of the Progress and Termination of the Roman Republic* (Lond. 1783), and *Principles of Moral and Political Science* (Lond. 1792). The work by which he is best known is his *History of the Roman Republic;* this, together with the Essay and Institutes, have gone through a number of editions. All his works have been translated into German and French, and the Institutes has been used as a text-book in several foreign universities. F. was distinguished for the decision and manliness of his character.

FERGUSON, JAMES, was born (1710) near Keith, a village in Banffshire, Scotland. His father being a poor day-labourer, he enjoyed only three months of instruction at school, and his subsequent acquirements were the result of his own insatiable thirst for knowledge. His tastes lay principally for practical mechanics and astronomy; and while keeping sheep, to which he was early sent, he was constantly employed in making models of mills, &c., and at night in studying the stars. After working at various country employments, he took to drawing patterns for ladies' dresses, and copying pictures and prints with pen and ink. He then supported himself and his parents by drawing portraits, first in Edinburgh, and afterwards (1743) in London; his leisure time being all the while given to astronomical pursuits. In 1748, he began lecturing on astronomy and mechanics with great acceptance. He was elected a Fellow of the Royal Society in 1763, and received from George III. a pension of £50. He now gave up portraits, and devoted himself to lecturing and writing on his favourite subjects. He died in 1776. F. was held in high esteem for the worth and amiability of his character, as well as for his extraordinary and self-taught acquirements. Few men have done more to promote a knowledge of the results of science, among those who have not the advantage of regular scientific training. His principal works are—*Astronomy explained upon Sir Isaac Newton's Principles* (1756; Sir David Brewster's ed., 2 vols. 1811); *Lectures on Mechanics, Hydrostatics, Pneumatics, and Optics* (1760); also edited by Sir David Brewster in 1805; and *Select Mechanical Exercises*, with an Autobiography (1773).

FERGUSSON, ROBERT, a Scottish poet, was born at Edinburgh about the year 1750, and received his education at the university of St Andrews, where he was in possession of a bursary founded by a person of his own name, and resided four years. Subsequently, he removed to Edinburgh, and was employed in the office of the commissary clerk. His poems were chiefly contributed to *Ruddiman's Weekly Magazine*, and gained him considerable local reputation. Unhappily, this reputation proved his ruin. His society was eagerly sought; and in that convivial time, he was led into excesses which permanently injured his health. He fell into a religious melancholy, and finally, through an accidental fracture of the skull, became totally deranged. He died on the 16th October 1774, at the age of twenty-four.

F.'s poems are distinguished by considerable humour, fancy, and purity of language, and he possessed great mastery over Lowland Scotch. He sketches with liveliness contemporary life and incidents, and much of our knowledge of old Edinburgh is derived from his verses. His fame however, rests quite as much upon his unhappy life and early death, and upon the circumstance that he was to some extent the forerunner of Burns, as upon the essential merits of his verse. Burns admired his works, was indebted to them for hints, called him 'his elder brother in the Muses,' and when he came to Edinburgh, erected a memorial-stone over his grave.

FERIÆ (Lat.), holidays during which political and legal transactions were suspended in ancient Rome, and slaves enjoyed a cessation from labour. Feriæ were thus *dies nefasti*, the opposite of the *dies fasti*. See FASTI. Days which were consecrated to a particular divinity, on which any public ceremony was celebrated, and the like, were feriæ. In contradistinction to these which were *feriæ publicæ* (public holidays), there were *feriæ privatæ*, which
were observed by single families, in commem
of some particular occurrence of importance t
or their ancestors. Birthdays, days of
after a funeral, &c., were also observed
feriæ. The public feriæ were divided into
which were always kept (*stativæ*) on ce
marked in the calendar; and those
kept by command of the consuls or oth
magistrates on the occasion of any public
'The manner in which all public feriæ
bears great analogy to our Sunday. The
generally visited the temples of the god
offered up their prayers and sacrifices. Th
serious and solemn seem to have been th
imperativæ; all the others were generally a
by rejoicings and feasting.' See an elaborate
by Dr Schmitz in Smith's *Dictionary of Gre
Roman Antiquities*. In Scotland, those days
which it was not lawful for courts to b
execution to proceed, or any other judici
to be taken, used to be called *ferial* times,
expression is obsolete.

FERMA'NAGH, an inland county in the
west of the province of Ulster, Ireland. I
miles long, and 29 broad; area, 714 square
⅔ arable, $\frac{1}{78}$ in wood, and above ⅓ in
including Upper and Lower Lough Erne, a
smaller lakes, Melvin and Macnean. The
is mostly a succession of mountains and h
the scenery varies. The chief rocks are li
with many cavities and underground water-c
millstone grit, and old red sandstone. S
iron, and marble occur. The chief rive
Erne and its tributaries, the Colebrooke,
and Arney. The soil in the low grounds
rich loam, but in the limestone and
districts it is cold and thin. The climate
and moist. Marsh-fever prevails in
autumn near Lough Erne. In 1872,
were in crop; oats, barley, wheat, pota
and hay being the chief products.
exports are oats, butter, and eggs. F.
into 8 baronies and 23 parishes. I
members to parliament. Principal to
killen, Lisnaskea, and Lowtherstown.
116,047; (1861) 105,372; (1871) 92,6
51,736 were Roman Catholics, 35,549 E
1755 Presbyterians, and the rest of other

FERMATA, in Music, is the
pause, or resting-point, generally
sign 𝄐. The notes over which th
are prolonged beyond their true

fermata is frequently found near the end of a part of a composition, which affords an opportunity for the singer or player to introduce an extempore embellishment.

FERMENTATION is the term applied to the change which occurs in one organic substance when influenced by another in a state of decay or putrefaction. The process was originally understood to include all the changes which matter of plant and animal origin undergoes when disunited from the living force, but is now restricted to certain of the changes. Thus, there are many substances, such as starch and sugar, which have no power of themselves to pass into decay, or change in composition through lengthened periods of time; whilst there is another class of substances, including albumen, fibrin, and caseine, as well as gelatinous tissues, mucus, &c., which, when exposed to moderately heated air a moist condition, more or less rapidly begin to refy or decompose. The latter substances, viz., se which spontaneously pass into a state of are called *ferments*, and when they are in contact with sugar, &c., which otherwise not be altered, they cause the latter to be ken up into simpler compounds; it is this cess that constitutes fermentation. The ferment always a body which has the power of rotting becoming putrid, and is actually in a state decomposition. Every substance which is liable putrefy becomes, while putrefying, a ferment; in this condition acquires the property of agoing the process of fermentation in any body capable of it, and retains the power is so far decomposed that the putrescence is . The ferments are very widely distributed in matter, and hence, whenever a plant or an dies, the process of fermentation proceeds or less rapidly. The most important kind of ntation is that known under the designation ous, and which forms part of the processes in preparation of alcohol, beer, wine, &c. It con- n the action of a peculiar ferment called Yeast upon a saccharine liquid, when the sugar $H_{12}O_{12}$) is decomposed into two atoms of hol (each $C_4H_6O_2$), four atoms of carbonic acid O_2), and two atoms of water (each HO). In ge it will be observed that the yeast, whilst the change, does not unite directly or with any of the constituents of the sugar. as fermentation proceeds best at a temperature ranging from 60 to 80° F., the mean desirable being about 70° F. The process causes the development of heat, and recourse be had, therefore, to large airy rooms, where fermenting tuns or vessels are arranged, and to the circulation of cold water in pipes disted round the interior of the vessels, and in t with the liquid. See BEER.

lactic acid fermentation takes place in milk egins to sour. The caseine of the milk acts of the ferment, and it causes the change ar of milk, which is in part resolved into ($C_6H_5O_5 + HO$). The latter then curdles ne, and the milk becomes clotted. When still further sours, and the material is kept erature of 77° to 86° F., the *butyric acid* on takes place, in which the putrefying changes the Sugar (q. v.) of milk into butyric $H_7O_3 + HO$).

mucous or *mucus* fermentation occurs when juice of the beet-root, dandelion, ash-tree, &c., allowed to decompose at a temperature of 90° F., when the albuminous matter present ane sugar to ferment into lactic acid, mannite, y substance, some alcohol, and various The same kind of fermentation occurs when boiled yeast or boiled gluten is added to ordinary sugar.

The remaining processes of fermentation are the *benzoic* fermentation, yielding, amongst other matters, the Essential Oil of Bitter Almonds (q. v.); the *sinapic* fermentation, which occurs in mustard when moistened with water, and during which the pungent oil of mustard is developed; and the *acetous* fermentation, which is, however, not a true instance of fermentation, as the oxygen of the air is required to complete the change. See ACETIC ACID.

FERMENTED LIQUORS are alcoholic beverages made by fermentation of saccharine fluids and juices; the principal being the different kinds of *ale* or *beer*, made by fermentation of an infusion of malt, chiefly of barley, but also sometimes of other kinds of grain; and *wine*, made by fermentation of grape-juice. *Cider* is made by fermentation of the juice of apples; *perry*, of that of pears; *palm-wine*, by fermentation of the sap of different kinds of palm. Fermented liquors, commonly called wines, are also made from the juice of various kinds of fruit, as currant wine from that of the red currant; and from the juice of some roots, as parsnip wine from that of the parsnip, &c. The sap of the American Aloe, or *Agave* (q. v.), yields the fermented liquor called *Pulque*, much used in Mexico. A wine is made from the sap of the birch, and that of some other trees is used for a similar purpose. *Mead* is a fermented liquor made from honey. From every fermented liquor, a kind of *spirit* may be obtained by distillation.

FERMENTED AND DISTILLED LIQUORS, STATISTICS OF. Under the headings BEER, SPIRITS, and WINE, will be found particulars as to the history, manufacture, &c., of these liquors. All that is contemplated in the present article, is a statement of the quantities manufactured and consumed in the United Kingdom of Great Britain and Ireland. In 1801, the consumption of spirits, British, colonial, and foreign, in the United Kingdom was 8,900,840 gallons. In fifty years, it had considerably more than trebled, having risen in 1851 to 28,760,224 gallons. In the same time, the population had risen from 15,506,794 to 27,452,262. In the former period, therefore, the consumption was at the rate of little more than half a gallon per head, while in the latter period it amounted to more than a gallon. There would seem, however, to have been something exceptional in the year 1801 to reduce the consumption to the low point we have mentioned, as in the previous year, the consumption was nearly 12 million gallons, and in the succeeding year, more than 15½ million gallons; and in no subsequent year did it fall so low as in 1801. The consumption at the two periods was divided over the three countries as follows: England, 1801, 6,150,983 gallons—namely, 2,555,920 British; 1,687,839 colonial; and 1,907,224 foreign. In 1851, 13,916,313 gallons—namely, 9,595,368 British; 2,542,395 colonial; and 1,778,550 foreign. In the former period, the consumption of each individual was less than three-fourths of a gallon; in the latter, nearly seven-ninths of a gallon. Scotland, 1801, 930,490—namely, British, 295,931; colonial, 349,237; and foreign, 285,322. 1851, 7,090,894—namely, British, 6,830,710; colonial, 179,883; and foreign, 80,301. The consumption per head in Scotland in 1801 was thus only three-fifths of a gallon, while in 1851 it was 2⅞ gallons. Ireland, 1801, 1,719,367 namely, British, 355,106; colonial, 1,057,316; foreign, 306,945. 1851, 7,753,017—namely, British, 7,550,518; colonial, 158,147; foreign, 44,352. In the former period, the consumption per head was two-thirds of a gallon; in the latter, about 1¼ gallon. But there is every reason to believe, that the consumption in 1801 was much larger in the United Kingdom generally than the statistics indicate. Between the periods we have mentioned, the duty on British spirits varied considerably. In England, in 1802, it was 5*s.* 4¼*d.* per gallon; in 1819, it had risen to 11*s.* 8¼*d.*; and in 1851, it stood at 7*s.* 10*d.* In Scotland, in 1802, the duty was 3*s.* 10½*d.* per gallon; it rose to 9*s.* 4½*d.* in 1815; and in 1851, was 3*s.* 8*d.* In Ireland, in 1802, it was 2*s.* 10¼*d.*; in 1815, it had risen to 6*s.* 1½*d.*; in 1851, it stood at 2*s.* 8*d.* The duties in the three countries have now been equalised, the sum fixed being at first 8*s.* per gallon, since raised to 10*s.*, at which it now (1873) remains. In 1871, there were manufactured in Great Britain 30,855,035 gallons of proof spirits; imported for home consumption, 8,895,877; exported, 3,891,369: the consumption was therefore 35,859,543 (the population being 31,609,910), or about 1¼ gallon to each. The total number of gallons of proof-spirits distilled in the United Kingdom in 1871 was 30,855,035—namely, in England, 7,739,720; Scotland, 13,813,062; Ireland, 9,302,253. The number of gallons on which duty was paid in the United Kingdom in 1871 was 25,114,201, the duty amounting to £12,557,105. Of this sum, £5,150,302 was paid in England on 10,300,597 gallons; £3,985,453, in Scotland on 7,970,902 gallons; £3,421,350 in Ireland on 6,842,702 gallons. Of the whisky distilled in Scotland in 1871, 3,923,732 gallons were exported into England, and 729,700 into Ireland; Scotland receiving in return from England 8160, and from Ireland 70,499. Ireland sent to England 1,822,507 gallons, and got back in return 112,283. Of foreign spirits, there were imported into the United Kingdom in 1871—rum, 7,526,870 gallons, of which 4,168,996 were for home consumption; brandy, 5,228,568 gallons, 3,715,563 being for home consumption; and other sorts, including Geneva, 1,961,633 gallons, 1,011,318 for home consumption.

The quantity of wine entered for consumption in 1802 was 5,449,710 gallons, upon which a duty of £1,723,339 was paid. In 1851, 6,280,653 gallons; duty, £1,776,246. In 1871, 17,870,078 gallons were imported, of which 16,341,446 were retained for home consumption.

The quantity of beer manufactured in Great Britain and Ireland can only be arrived at approximately, the duty being leviable on the malt. The general estimate is, that two bushels of malt produce one barrel, or 36 gallons of beer. In 1871, the quantity of malt brewed in the United Kingdom was 50,724,086 bushels, equal to 25,362,043 barrels, or 913,033,548 gallons of beer. This beer was made chiefly in England, 45,123,969 bushels of malt being consumed there; in Scotland, the quantity used was 2,728,574 bushels; and in Ireland, 2,871,554.

FERMO, a town of Italy, capital of the former delegation of the same name, is situated on a rocky height 4 miles from the Adriatic, and 32 miles south-south-east of Ancona. It is well built and fortified, surrounded with walls and ditches, is the seat of an archbishop, and has a cathedral, a university (not, however, of any importance), and an elegant theatre. It has some trade in corn and wool. Pop. 9130. In the immediate vicinity are the ruins of the ancient Firmum, whose name F. inherits. Firmum had been a Roman colony from the year 264 B.C.

FERMOY, a town in the east of Cork county, Ireland, chiefly on the right bank of the Blackwater, 19 miles north-east of Cork city. Its origin dates from the 12th c., when it was the seat of a great Cistercian abbey; but its present importance, which commenced in the end of last century, is due to Mr (afterwards Sir John) Anderson, who introduced mail-coaches into Munster. The hills t south of the town rise in Knockinskeagh feet. F. is handsomely built and regularly out. A large ecclesiastical establishment (Ro Catholic), consisting of a church, a bishop's h two convents with large schools, and a college nearly 100 students, has recently been erecte a hill rising from the Blackwater. A brid 13 arches, built in 1689, crosses the river. Infa and cavalry barracks for 3000 men stand on the bank of the river, and command the approac Cork. F. has a trade in agricultural produce. (1861) 8705; in 1871, 7611. The town-rate 1871 were £341.

FERN, MALE, a name given, in consequence o erroneous notion, long since exploded, to a fern common in the woods of Britain and of the co nent of Europe, the *Aspidium filix mas* of a botanists, and *Lastræa filix mas* and *Nephrod filix mas* of others. The fronds are bipinnate: pinnules oblong, obtuse, and serrated; the sori the central nerve, orbicular, kidney-shaped, fixed by the sinus; the stipes and rachis chaffy.

Common Male Fern.

not one of the very finest of our ferns, it is certa a chief ornament of many of our woods, and a p of very considerable beauty. The subterra stem (rhizome) is officinal. It is about a foot l and of the thickness of a quill, almost inodo with a nauseous sweet taste, becoming astr and bitter. It was anciently used as an anthe and its use has been revived, especially in of tapeworm, in which it is believed to be efficacious. Its anthelmintic powers are due thick, almost black volatile oil which it cont and which is now itself also used in medicine.

FERN, SWEET (*Comptonia asplenifolia*), a of the natural order *Amentaceæ*, sub-order *My* native of the mountain-woods of North Am forming a small bush with linear pinnatifid like leaves. Its leaves have a powerful ar fragrance when rubbed. It is tonic and and is much used in the United St domestic remedy for diarrhœa.

FERNA'NDO PO, an island on the west co Africa, in the Bight of Biafra, is situated abo miles from the nearest point on the shore, an about 44 miles long and 20 miles broad. appearance of this island from the sea is exceedi picturesque and beautiful. It is traversed mountain-ridge, which, in Clarence Peak, rea the height of 10,650 feet, and is fertile, well-wat and in many parts thickly wooded. Besides sw of monkeys, some of which are of great size, island contains many goats and sheep in a state of nature. The climate, always excessively hot, is rendered more intolerable, during the rainy season, by a pestilential wind from the continent. The native population, who are of negro race, are said to amount to from 10,000 to 12,000 in number, and to inhabit fifteen villages. The English, with the consent of Spain, into whose hands F. P. had fallen, made an attempt in 1827 to form a settlement on the island, but abandoned it in 1834. In 1844, it was again taken possession of by Spain. The colony has a population of about 900, most of whom are liberated Africans.

FERNAN-NUNEZ, a small town of Spain, in the province of Cordova, and 10 miles south of the town of that name. It has some linen and woollen manufactures. Pop. 5500.

FERNS (*Filices*), an order of acrogenous or cryptogamous plants, divided by some botanists into several orders; whilst some make *Filices* a sub-class, and include in it *Lycopodiaceæ*, *Marsileaceæ*, and *Equisetaceæ*. See these heads. F. are either herbaceous perennial plants, or more rarely trees, the root-stock or the stem producing leaf-like *fronds* (often called leaves), which are sometimes simple, sometimes pinnated, or otherwise compound, exhibit great variety of form, and are generally coiled up (*circinate*) in bud (see accompanying illustration).

Ceterach Officinarum.

fronds are traversed by veins, generally of orm thickness, which are simple or forked, or ed, sometimes produced from the sides of a rib or primary vein, sometimes from a primary on one side, sometimes radiating from the of a frond or segment of a frond. The fructi- ion takes place either on the lower surface or he margin of the fronds, and arises from the . The spores are contained in capsules or cases (*thecæ*, *sporangia*), which are often ounded with an elastic ring, and are either ed or covered with a membrane (*involucre* or usium), and are generally clustered in round or ted or kidney-shaped masses (*sori*). The a of the frond is sometimes folded so as to the spore-cases, and sometimes, as in the wering Fern (*Osmunda*) (q. v.), the fertile part the frond is so transformed that its leaf-like cter entirely disappears, and it becomes a spike nicle. The spore-cases burst at their circumference, or longitudinally, or irregularly. Moving spiral filaments exist in F., but their functions in connection with reproduction are not well known.

Ferns:
Shewing the Sori on the back of the Fronds.

The reproduction of F. has been the subject of much investigation and discussion, and supposed discoveries of sexual organs have been announced, but satisfactory evidence of their nature has not been obtained. The number of known species of F. is about 2500. They are found in all parts of the world, but are fewer towards the poles than within the tropics, and fewer in continental than in maritime countries, abounding exceedingly in mountainous tropical islands, as in Jamaica. Many of them delight in moisture and shade, although some are found in the most exposed situations. Some of them resemble mosses in size and appearance; whilst Tree Ferns (q. v.) resemble palms, and sometimes attain a height of forty feet. A few are climbers. One climbing species (*Lygodium palmatum*) is found in North America as far north as Boston. F. are divided into *Polypodieæ*, *Hymenophylleæ*, *Gleicheniæ*, *Schizeæ*, *Osmundeæ*, *Danææ*, and *Ophioglosseæ*, of which sub-orders (or orders) the first, second, fifth, and seventh alone contain British species, and the first contains a great majority of all ferns. The root-stocks of some F. contain so much starch that they are either used as food, or food is prepared from them, particularly those of the Tara (q. v.) Fern in New Zealand and Van Diemen's Land, and those of *Aspidium* (or *Nephrodium*) *esculentum* in Sikkim and Nepal; also the stems of some of the tree-ferns, as of *Cyathea medullaris* in New Zealand, and *Alsophila spinulosa* in India. The young and tender fronds of some F. are occasionally used as pot-herbs in the Highlands of Scotland, Norway, the Himalaya, &c. The fronds are generally mucilaginous, slightly aromatic and astringent. Those of some species of Maidenhair (q. v.) are used for making *capillaire*; whilst the bitter and astringent root-stocks of some F. are occasionally used in medicine, as those of the Male Fern (see FERN, MALE) and the Peruvian *Polypodium Calaguala*, particularly as anthelmintics. The fronds of a few species are delightfully fragrant. The cultivation of F. is now in many places successfully conducted on a somewhat extensive scale, both in the open air and in hothouses; and to such an extent has the occupation of fern-collecting reached, that many excellent treatises on this subject alone have been written and elaborately illustrated. Amongst others, we may mention *British Ferns* (1s.), published by Routledge, London, as an excellent handbook; while the magnificent Nature-printed work, published in 2 volumes, royal 8vo, by Bradbury and Evans, supplies all needful information. Wardian cases, filled with them, have also become common, and are most pleasing ornaments of apartments. The principal species will be noticed under their particular heads.

FERO'ZÉ PORE (so called from its founder, Feroze Toghluk, who reigned in Delhi from 1351 to 1388) stands about 3 miles from the left or south-east bank of the Sutlej, in lat. 30° 55′ N., and long. 74° 35′ E. At one time, a large and important town, as its massive fortifications and extensive ruins still indicate, it had sunk into poverty and insignificance, before it actually came, in 1835, into the possession of the English. Since then, the place has regained much of its former consequence, holding out, with its wide streets and its colonnaded bazars, the promise of a grand emporium of commerce. Politically, too, F. P. has become prominent under British supremacy, having been a starting-point, whether for war or for negotiation, in many of our dealings with Afghanistan and the Punjab. In connection with this feature in its history, the city contains a monumental church in honour of the memory of those, both privates and officers, who fell in the various conflicts with the Sikhs. The population is about 10,000.—The *district* of the same name has an estimated area of 200 square miles, and a population of 20,000. It is now for the most part either barren or covered with jungle, but the ruins of towns and villages indicate that it must have been at one time both more fertile and more populous.

FERO'ZÉ SHAH, a village apparently within the district of Feroze Pore, and situated about 10 miles east-south-east of the town of that name, is in lat. 30° 52′ N., and long. 74° 50′ E., lying about 12 miles from the left bank of the Sutlej. It claims notice mainly as the scene of the second in order of the four great battles of the first Sikh war. The conflict in question, which lasted two days, took place in December 1845, ending in the rout of the natives and the capture of their intrenchments. The British army was commanded by Sir Hugh Gough and Sir Henry Hardinge; and, as in the victory of Moodkee, gained only three days before, it sustained heavy loss.

FEROZE SHAH CANAL, a work, including its branches, of 240 miles in length, demands detailed notice as well for its historical interest as for its economical value. It dates back as far as 1356, owing its origin, as well as its name, to Feroze Toghluk, king of Delhi. Viewed as a whole, it leaves the right bank of the Jumna in lat. 30° 19′ N.; and, after sweeping round so as to skirt Sirhind, a territory on the Sutlej, it rejoins its parent stream at Delhi in lat. 28° 39′, thus measuring, in mere difference of latitude, 100 geographical miles. This artificial water-course, intended principally for the purposes of irrigation, seems to be equally creditable to native enterprise and native skill. But, as nothing of the kind appears to be permanent in the East, this noble channel was so much neglected, that, in the beginning of the 17th c., it was cleared out by Vizier Ali Murdan Khan, who, in point of fact, was the first to carry it, through its lower half, back into the Jumna. Finally, the entire line has, during this 19th c., been again repaired and improved by the British government. In the light of the drought and famine of 1860, the importance of such undertakings as the Feroze Shah Canal can scarcely be overrated.

FERRANDI'NA, a town in the south of Italy, in the province of Basilicata, stands on a height on the right bank of the Basento, 35 miles east-south-east of Potenza. Good wine is produced in the neighbourhood. Pop. about 6000.

FERRA'RA, the most northern of the Italian provinces that are washed by the Adriatic. It extends immediately south of the Po, between the main branch of which, and the Po di Primaro, it is for the most part enclosed. As one of the old delegations, it had an area of 1180 square with a population amounting to 244,524: according to the *Statistica Administrativa del* *d'Italia*, published in 1861, the province had u gone certain modifications, and its pop. was only 194,161; in 1871, it was 215,369. The consists, for the most part, of swamp and and many rivers and canals intersect it. Bet the Po di Volano and the Po di Primaro, marshes become very extensive, and receive name of *Valli di Comaccio*. This province pro great quantities of fish, affords good pastures carries on a great trade in corn and hemp was at one time a dukedom under the Hos Este, but on the failure of a legitimate le Pope Clement VIII. wrested it from t and annexed it to the States of the Cl 1598. It became part of the kingdom of 1860.

FERRA'RA, an ancient city of Italy, capi the province of the same name, is situated in marshy plain in the delta of the Po, and ab miles south of the main branch of that rive miles north-north-east of Bologna, and 40 north-west of Ravenna. F. was first made a city by the exarch of Ravenna about the close 6th c., and in the following century (661 A. D.) be the seat of a bishop. In the middle ages, it w great commercial emporium of Italy, and the of a court renowned throughout Europe; but the city has a peculiarly deserted and melan appearance; grass grows on the pavements broad and regular streets, and its churches palaces are either rapidly falling, or have fallen into decay. It is surrounded with and is strengthened by bastions and a fortress. old castle, or ducal palace, once the residence of Dukes of Este, but recently, until 1860, occu by the papal legates, rises like a huge strengthened with corner-towers, and by a ditch. Its ecclesiastical edifices, very numerous, and of which the chu Santa Maria degl' Angeli and of San B are the most remarkable in point of archit are rich in paintings by the great mast the Ferrara and Bologna schools. Besides valuable paintings, these churches contain ous sculptured monuments of famous perso church of San Francesco has a curious echo, sixteen reverberations. The university, foun 1264, was reorganised in 1402, closed in reopened in 1824. It is in high repute as a of medicine and jurisprudence, and is attend about 200 or 300 students. It has an ex library, which, besides a variety of MSS., paintings, and old editions of printed works, tains several of the works of Tasso and Ar in their own hand. F. is specially remarkable its art associations. Under the patronage of Dukes of Este, it produced a school of pai who rank high in the history of art; whi literature the name of F. is immortalised th its connection with those of Tasso, Ariosto, Guarini. At the period of its greatest pr F. had about 100,000 inhabitants, but at (1873) it has a population of only 72,447.

In 1849, the Austrians took possession of town, but were compelled to abandon it at commencement of the Italian campaign in 1859. In April 1860, F., with the state of it is capital, was formally annexed to the of Italy under Victor Emanuel.

FERRA'RI, GAUDENZIO, sprung from a which followed a career of art as if by inh was born at Valdugia, in the Milanese, A scholar of Andrea Scotto and Perugino, and the chosen associate and friend of Raphael, his own creations may be said to have caught some inspiration from each of these three great masters, while they also unmistakably reflect genius of a bold, unshackled originality. The chief characteristics of F.'s style are correct and vigorous delineation, extreme vividness and delicacy of colouring, noble grace of form and attitude, and unsurpassable art in the classic disposal of drapery. Being one of the most laborious artists of his day, he has executed innumerable paintings both in *fresco* and in oil, the greater part of which are possessed by the Lombard galleries. His most comprehensive work, the frescos at Barallo, in Piedmont, represents the Passion; the 'Martyrdom of St Catherine,' to which he owes his brightest fame, is in the Milanese collection of paintings. He died in 1549, having formed some good scholars, the chief of whom is Andrea Solario.

FERRATES are combinations of ferric acid (FeO$_3$), a weak unstable compound of iron and oxygen with bases. See IRON.

FERREIRA, ANTONIO, one of the classic poets of Portugal, was born at Lisbon, 1528. He was educated at Coimbra, where he occupied himself with the study of the Italian and Latin authors, more especially Horace, whom he almost rivalled in conciseness, but not in elegance of expression. After holding for some time the office of a professor at Coimbra, he obtained a civil appointment of some importance at the court of Lisbon. He carried to perfection the elegiac and epistolary styles, already attempted with success by Sa de Miranda, and transplanted into Portuguese literature the epithalamium, the epigram, ode, and tragedy. His *Inez de Castro* is the second regular tragedy that appeared r the revival of letters in Europe, the first being *Sophonisba* of Trissino. It is still regarded by Portuguese as one of the finest monuments their literature, for its sublime pathos and the perfection of its style. The works of F. are not nerous, as his official duties left him little leisure. died 1569. All his works are distinguished by soundness and depth of thought. His expression is strong rather than sweet, is extremely animated, and full of that fire which elevates the mind and rms the heart. His efforts after brevity, however, frequently led him to sacrifice harmony to thought. His *Poemas Lusitanos* were first published at Lisbon, 1598, and the *Todas as Obras de Ferreira* in 1771. Compare Sismondi's work, *La Littérature du Midi* (Paris, 1813), and Bouterwek's *Geschichte der neuern Poesie und Beredsamkeit* (12 vols. Gött. 1801—1819).

FERRET (*Mustela furo*), an animal of the weasel family (*Mustelidæ*), so nearly allied to the Polecat (q. v.), that many regard it as a mere domesticated variety. It is of rather smaller size, the head and body being about fourteen inches long, the tail five inches and a half, the muzzle rather longer and more pointed, the head rather narrower; and the colour is very different, being yellowish, with more or less of white in some parts, there being two kinds of hair, the longer partly white, the shorter yellow. The eyes are pink. It is, however, much more susceptible of cold than the polecat, and requires careful protection from it in climates where the polecat is a hardy native. It was imported into Europe from Africa, and was well known to the Romans, being ently employed, as it still is, in catching rabbits, which purpose it is often sent into their bur- s muzzled, or 'coped,' by means of a piece of to drive them out into nets, or, with a string d to it, it is allowed to e a rabbit in the burrows, and is then drawn out, holding it fast. The usual plan, however, is to let the F. have free range of rabbit-holes unmuzzled. Ferrets are generally kept in boxes, and attention to warmth and cleanliness is essential to their health. They are capable only of partial domestication, acquiring a kind of familiarity with man, and submitting with perfect quietness to his handling, but apparently never forming any very decided attachment; and they never cease to be dangerous if not carefully watched, especially where infants are within their reach. If allowed any measure of freedom, they are ready to attack poultry, and kill far more than they can devour, merely sucking the blood. They generally breed twice a year, each brood consisting of six or nine. The female sometimes devours the young ones, in which case another brood is speedily produced.

Ferret (*Mustela furo*).

FERRIDCYANOGEN is a compound organic radical which has not been isolated, but which forms with potassium a well-known compound used in the arts, called the ferridcyanide of potassium or red prussiate of potash. In the preparation of this salt, a solution of ferrocyanide of potassium is acted on by a stream of chlorine gas until the colour of the liquid passes from yellow to deep red, and thereafter, on evaporation and cooling, fine red crystals are obtained. The chlorine (Cl) acts upon two equivalents of the ferrocyanide of potassium (twice $2K,FeC_6N_3 = 4K,Fe_2C_{12}N_6$), removing one equivalent of potassium (K), forming chloride of potassium (KCl), whilst the remaining constituents combine together, and produce one equivalent of ferridcyanide of potassium ($3K,Fe_2C_{12}N_6$, or $3K,Fe_2Cy_6$, or $3K,Fdcy$). The latter is known commercially in red crystals, readily soluble in water, and yields a fine deep *Prussian blue* (Turnbull's blue) when mingled with solution of protosulphate of iron (green vitriol), and hence is used largely in dyeing and calico-printing.

FERRIER, JAMES F., LL.D., a metaphysician, was born in Edinburgh, November 1808. After studying at Oxford, where he took the degree of B.A. in 1832, he was admitted to the Scottish bar in 1833. In 1842, he was elected to the chair of History in the university of Edinburgh, and in 1845 to that of Moral Philosophy in the university of St Andrews. Mr F. early attracted notice by some metaphysical essays, which appeared in *Blackwood's Magazine*; and in 1854 he published the *Institutes of Metaphysics*, in which he endeavours to construct a system of idealism in a series of propositions, demonstrated after the manner of Euclid. He atte-wards edited the collected works of his father-in-law, the late Professor John Wilson of the University of Edinburgh. Died at St Andrews, June 11, 1864.

FERRIER, SUSAN EDMONSTON, aunt of the former, a successful novelist, was born in Edinburgh in 1782, and died in 1854. Her father, James Ferrier, one of the principal clerks of the Court of Session, and the colleague in that office of Sir Walter Scott, lived on terms of intimacy with the wits and literati of his day in Edinburgh, and Miss F.'s talents and quick powers of observation were early called into play in the midst of the literary society in which her youth was passed. Her first work, *Marriage*, appeared in 1818, and this was followed by *The Inheritance* (1824), and *Destiny* (1831). The merit of these tales, which are characterised by genial wit, a quick sense of the ludicrous, and considerable ability in the delineation of national peculiarities, is sufficiently proved by the fact, that they have stood their ground, notwithstanding the enormous number of works of fiction which have flowed from the press since their publication. Miss F. enjoyed the esteem and friendship of Sir Walter Scott, who, in the days of his strength, repeatedly gave expression to his appreciation of her talents, and who derived consolation from her sympathy in the season of gloom which darkened the close of his life.

FE'RRO, or HIE'RRO, the most western of the Canary Isles, was formerly considered the most westerly point of the Old World, and for this reason geographers at one time took it as the point of departure in reckoning longitudes, as is still done by the Germans and others. Hence, in all probability, originated the present hemispherical division of the maps of the world, F. being taken as the boundary-line. The English, however, have adopted the meridian of Greenwich as the first meridian and in this their example is followed by the Dutch, and in sea-charts generally; area, 82 square miles; pop. 4400. The meridian of F. is 18° 9' west of that of Greenwich. See LONGITUDE.

FERROCYA'NOGEN is a compound organic radical, generally regarded by chemists as existing in ferrocyanide of potassium, or the yellow prussiate of potash, but which has not yet been obtained in a separate state. The principal compound of ferrocyanogen is the ferrocyanide of potassium, which is prepared by heating to redness in a covered iron pot a mixture of 3 parts by weight of nitrogenised matter, such as dried blood, hoofs, parings of hides, scrapings of horn, or the flesh of old or diseased horses and other animals, 3 parts of carbonate of potash, and one part of iron filings. The carbon, nitrogen, and iron combine together, and form ferrocyanogen (FeC_6N_3 = $FeCy_3$, or Cfy), which, at the same time, unites with the potassium, and produces ferrocyanide of potassium, or yellow prussiate of potash (2K,Cfy). The compound which is obtained from the heated iron vessel is impure, but by repeated solutions in hot water, and recrystallisation on cooling, the salt is obtained pure in fine large tabular crystals of a lemon-yellow colour. The ferrocyanide of potassium is largely used in dyeing and Calico-printing (q. v.) in the production of many shades of *Prussian blue;* and when it is treated with sulphuric acid, and subjected to heat applied, hydrocyanic or prussic acid (HC_2N = HCy) distils off from the mixture. The ferrocyanide of potassium is characterised by giving no indication of the presence of iron in its radical on the application of any of the tests for iron. It gives a light-blue precipitate on the addition of a solution of proto-sulphate of iron; a dark blue precipitate with perchloride of iron; a ruddy brown precipitate with sulphate of copper; and a precipitate with acetate of lead.

FE'RROL, a strongly fortified seaport tow Spain, in Galicia, is most advantageously situ on a narrow arm of the sea, 14 miles north-ea the town of Corunna. It was originally a fish town, until selected for its natural advantages seaport by Charles III., who erected here what at one time the finest naval arsenal in the w and destined it exclusively for the Spanish navy. The entrance to the harbour, formed narrow inlet from the Bay of Betanzos, admit the approach of only one ship-of-the-line at a and is defended by the castles of San Felipe Palma. The town is defended by walls and fo cations, is, on the whole, regularly built, and several squares and pleasing alamedas or p walks. The arsenal, in which fifteen ships-of- line could be simultaneously built, covers a g space; and though now in a somewhat ru condition, is still the most important in Spain. has manufactures of hats, naval stores, hardwa and exports corn, brandy, vinegar, and fish. (including the garrison) 16,640.

FE'RROTYPE, a term applied by Mr Ro Hunt, the discoverer, to designate some ph graphic processes, in which salts of iron play important part. Like many of the earlier processes, the ferrotype is far inferior in sensi to the more modern collodion process or Arc type, and is on that account seldom if ever even for landscapes.

FERRU'GINOUS is a term employed in che try to denote the presence of iron in natural wa minerals, &c. It is synonymous with the chalybeate. See CHALYBEATE WATERS.

FERRY (from Sax. *faran*, Ger. *fahren*, to mo proceed, allied to the Lat. *fero*, Eng. *bear*), a pas by boat across water. By the law of Engla a man may have a right to keep a boat and ferry passengers for a consideration, just as may have a right to hold a fair, either by ro grant, or by prescription, from which a royal gr at some previous time will be presumed. other title, unless conferred by act of parliam will suffice, for no fair, market, or ferry can be up without licence from the crown either ac or presumed. The possessor of such a title m not necessarily be the proprietor of the soil which the market is held, or of the water which the right of ferry is exercised. In latter case, he need not be the proprietor of the on either side of the river, though he must pos such rights over it as will enable him to embark disembark his passengers. As fulfilling his part the bargain with the public, the owner of a ferr bound to keep a boat fit for the purpose of c passengers, whilst on the other hand he has of action not only against those who re evade payment of the toll or passage mone against those who disturb his franchise by up a new ferry so near as to diminish his c Stephen, i. pp. 663, 664. It has been mo once decided, that the erection of a second f such circumstances is a nuisance to the o the old one, who is bound to keep his ferry ness for the use of the Queen's subjects, a b which is not shared by his rival (North and S Shields Ferry Co. v. Barker, 2 Exch. 136). rule in Scotland as to rival ferries is the same: a grant of ferry from the crown to one herito not prevent his neighbours from keeping p boats for the transport of themselves and families and servants. Where ferries have not given out by royal gift, either express or presum as above described, they are *inter regalia*, i. e., they belong to the crown for the public benefit. In this case, they are under the management of the trustees of the roads connected with them, or are regulated by the justices of the peace for the county, or by special acts of parliament. By 8 and 9 Vict. c. 41, certain rules are laid down for the regulation of ferries. The act is confined to Scotland.

Common rowing-boats are generally used for ferrying foot-passengers, but when horses and carriages have to be taken across, a flat-bottomed barge, with an inclined plane at one end, to rest upon the shore, for landing and embarking, is generally used. This is either rowed across or pulled by a rope. When the current is strong, and the river of moderate width, the latter is best. The rope stretched across the river passes through rings or over pulleys attached to the barge, and the ferrymen move the barge across by pulling the rope. The chief advantage of the rope is to restrain the barge from drifting in the direction of the stream. With a small boat, this is obviated by the ferryman rowing obliquely, as though he were steering for a point higher up the river; thus he moves through the water upwards to the same extent that the water moves over the land downwards; and by a composition of these motions, and his tending to the other side, he is carried directly across. Broad estuaries are now traversed in many places by steam ferry.

Rafts are sometimes used for ferrying. On the Nile, a sort of raft is made of inverted earthen-pots full of air. For further information on the crossing of rivers, see FORDS AND FORDING.

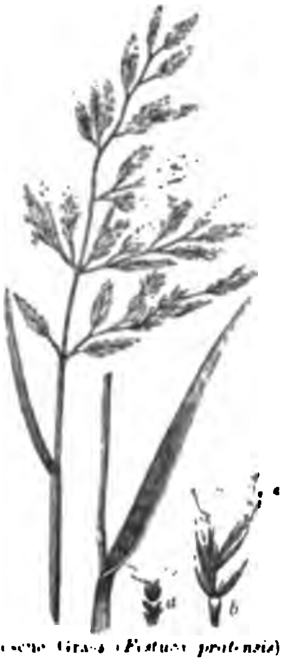
Flying-bridge is the name given to a kind of ferry-boat which is moved across a river by the action of the combined forces of the stream and the resistance of a long rope or chain made fast to a ed buoy in the middle of the river. The boat s attached is made to take an oblique position means of the rudder; the stream then acting inst the side, tends to move it in a direc- at right angles to its length, while the rope rts a force in the direction towards the buoy. these two forces be represented by the sides a parallelogram, the actual course of the boat would be in the direction of the diagonal (see SITION AND RESOLUTION OF FORCES); but as ength of the rope remains the same, the boat at continue always at the same distance from buoy, and therefore its course is a curve, a portion of a circle, of which the buoy is the centre, and the rope the radius. The course of the boat and the action of the two forces are strictly analogous to the path of a rising kite, and to the forces of which this path is the resultant. The holder of the kite corresponds to the buoy, the wind to the tidal stream, and the tail to the rudder. Flying-bridges are used for military purposes, and the modes of adapting them to the varying circumstances of the width of rivers and the velocity of their currents, forms a part of the study of military engineering. An important element in the problem, is the determination of the right point of attachment for the rope. In the case of a wide river, the rope or chain requires to be of considerable length, and must be supported by movable buoys or by small boats.

FERTILISATION OF PLANTS. See FECUNDATION.

FESA, or FASA, a town of Persia, in the province of Fars, 80 miles south-east of Shiraz, is situated in a mountain defile, is of considerable size, and is said to have a population of 18,000. It has manufactures of silken, woollen, and cotton fabrics, and some trade in a superior kind of tobacco which is grown in the vicinity.

FESCENNINE VERSES, a branch of the indigenous poetry of ancient Italy, were a sort of dialogues in rude extempore verses, generally in Saturnian measure, in which the parties rallied and ridiculed one another. It formed a favourite amusement of the country-people on festive occasions, especially at the conclusion of harvest and at weddings. As was to be expected, it often degenerated into licentiousness, that at last required the curb of the law. The Fescennine verses are usually considered to be of Etruscan origin, and to have derived their name from the Etrurian town Fescennium; but there is little probability in this etymology. Verses of this sort were and are popular to this day all over Italy. The name is more likely connected with *fascinum*, fascination, enchantment, or the evil eye, against which the chanting of verses may have originally been intended as a protection.

FESCUE (*Festuca*), a genus of grasses, very nearly allied to Brome-grass (q. v.), and having in some species a loose, in some a contracted panicle; the spikelets many-flowered, with two unequal glumes, which they much exceed in length; each floret having two lanceolate paleæ, the outer palea rounded at the back, and acuminate or awned at the summit; the stigmas growing from the apex of the germen. The species are numerous, and are very widely diffused over the world, both in the northern and southern hemispheres. Among them are many of the most valuable pasture and fodder grasses. None are more valuable than some of the British species. MEADOW F. (*F. pratensis*), a species with spreading panicle and linear spikelets, from two to three feet high, common in moist meadows and pastures of rich soil, in Britain and throughout Europe, in Northern Asia, and in some parts of North America, is perhaps excelled by no meadow or pasture grass whatever. It is suitable both for



Fescue Grass (*Festuca pratensis*):
a, germen and stigmas; *b*, a spikelet.

alternate husbandry and for permanent pasture.—Spiked F. (*F. loliacea*)—by many botanists regarded as a variety of Meadow F., although it departs from the habit of the genus in having the branches of the panicle reduced to a single spikelet, and forming a two-rowed raceme or spike—is regarded as an excellent grass for rich moist meadows.—Hard F., (*F. duriuscula*), a grass from one foot and a half to two feet high, with a somewhat contracted panicle, mostly on one side, is one of the best grasses for lawns and sheep-pastures, particularly on dry or sandy soils. Several varieties are known to seedsmen and farmers.—Creeping F. or Red F. (*F. rubra*) is probably a mere variety of Hard F., being distinguished chiefly by its extensively creeping root, which particularly adapt it to sandy pastures, and to places liable to occasional inundations.—Sheep's F. (*F. ovina*) is a smaller grass than any of these, not generally exceeding a foot in height, and often much less, abundant in mountainous pastures, and especially suitable for such situations, in which it often forms a principal part of the food of sheep for many months of the year. It is common in all the mountainous parts of Europe, and in the Himalaya, it is also a native of North America, and species very similar, if not mere varieties, abound in the southern hemisphere. Its habit of growth is much tufted.—Tall F. (*F. elatior*) is a grass of very different appearance, four or five feet high, with spreading much branched panicle, growing chiefly near rivers and in moist low grounds, and yielding a great quantity of coarse herbage, which, however, is relished by cattle.—Of foreign species, which have been introduced into Britain, *F. heterophylla* best deserves notice, a tall species with narrow root-leaves, and broad leaves on the culm; a native of France and other parts of the continent of Europe, and pretty extensively cultivated in some countries, particularly the Netherlands.—All these species are perennial.—Some small annual species occasionally form a considerable part of the pasture in dry sandy soils, but are never sown by the farmer.—A Peruvian species (*F. quadridentata*), called *Pigouil* in its native country, and there used for thatch, is said to be poisonous to cattle.

FESS. The fess in heraldry consists of lines drawn horizontally across the shield, and containing the third part of it, between the honour point and the nombril. It is one of the honourable ordinaries, and is supposed to represent the waist-belt or girdle of honour, which was one of the insignia of knighthood.

Per Fess.—A shield, or charge in a shield, is said to be *party per fess*, when it is horizontally divided through the middle, or, as the French say, simply *coupé*.

Fesswise is said of a charge placed *in fess*; that is to say, horizontally across the shield.

FE'SSLER, Ignaz Aurelius, a celebrated Hungarian historian, was born in 1756, in the county of Soprony or Oedenburg. During a long life full of adventures, F. served successively the Emperor Joseph II., the King of Prussia, and the Emperor of Russia; and also held the office of Professor of Oriental Languages at different universities. He died at St Petersburg 15th December 1839. Among his works of a lasting value are—*Attila* (Breslau, 1794), *Mathias Corvinus* (2 vols. 1793; 2d edition, 1806, Breslau), and the History of the Hungarians, &c. (*Geschichte der Ungern und deren Landsassen*, 10 vols., Leip. 1812–1825). His autobiography, entitled Recollections of my 70 Years' Pilgrimage (*Rückblicke auf meine 70 jährige Pilgerschaft*, Breslau, 1826; 2d edit. Leip. 1851), is also a very interesting work. Deep learning, coupled with a rare beauty

of style, render F.'s works (all written in Germ
attractive in the highest degree.

FE'STIVAL PLAYS. See Moralities, Mira
Plays, Mysteries.

FE'STIVALS, or FEASTS (Lat. *festum*, proba
from the same root as *fast* (q. v.); according to so
from Gr. *hestia*, hearth), a term denoting cert
periodically recurring days and seasons set asid
a community for rest from the ordinary labou
life, and more or less hallowed by religious sol
nities. Originating within the narrow circle o
family, and commemorating momentous eve
ing one member or all, these pauses bec
frequent, and of wider scope, as the house g
expanded into a tribe, a people, a state. T
or imaginary founders, legislators, heroes,
objects of veneration and deification, and the sal
epochs of their lives the consecrated epochs of
year. National calamities or triumphs were, in
absence of annals, best remembered by correspond
general days of humiliation or exultation. Earli
of all, however, did the marked stages in the cou
march of nature: spring and autumn, seed-time
harvest-time—symbols of life and death; the
stices—turning-points of summer and winter;
new moon and the full moon; the termination
cycles of moons and cycles of years, present th
selves as opportune halting-places for man him
No less were the all-important periodical rise
fertilising rivers, and the anniversaries of
tions and inventions of new implements
better cultivation of the soil, or tending of
befittingly celebrated. The inherent human
towards referring all things of graver impo
and death, abundance and want, victory and
to a higher power, could not but infuse a
feeling into epochs so marked. Fostered a
by priests and lawgivers, this property of c
erelong found its expression in common
prayers, and ceremonies, consecrated to the
superior and minor deities who presided o
inhabited the elements of the visible and in
creation, and who, working all the changes
them, acted, each in his sphere, as a partial
dence over man. According to the event
called them forth, these festivals were mour
joyous, jubilant or expiatory. Even when
was to be expressed, the mortification of the
did not always suffice, but plays, songs, dances
processions full of boisterous mirth, were re
to—as in the festivals of Isis at Busiris, of
at Papremis, in the Adonia of Egypt, P
Greece—because the divine wrath or
like that of man, to be changed into

deity and those he protected, the bond
which the otherwise disconnected members
body politic were held together was, by me
these festive gatherings, periodically bro
view, and invested with greater stre
importance. Apart, however, from this
torical, astronomical, religious, and political
festivals served another purpose—that of gre
civilisation. It was the glowing spirit of emula
which, stimulating the gifted in mind and b
strive for the festive laurel in contests of g
skill, in honour of the gods, and in the
the people, matured all that was noble and b
within the community. Archaic rudeness and
extravagance became refined grace and ela
mony. The stirring drama, the glorious
the melodious dance, the elegant game,
accompanied the festive sacrifice of some
at their highest stage of development, had
out of these very mimicries and shouts,

vage beyond expression, of generations not efore them. Enthusiastic, wild, metaphysical invested the countless days consecrated to ified stars, plants, animals, and ideas; to the to Ammon, Kneph, Menes, Osiris; to Horus, itha, to Ptah, with a mystery, sensuality, ournfulness always exaggerated, sometimes rous. The Hindu, no longer daring to offer a es, shews his old and cruel mate- y throwing into the waves, on his festival some of his costliest goods, gold, jewels, and instruments; while in the licentious- debaucheries perpetrated on the festival of the god of procreation, or on the Bacchantics goddess Bhavani, he exceeds even those of ptians on their Neitha feasts at Bubastis, Greek worship of Venus in her Cyprian Phœnicians and Assyrians, Babylonians gians, according to the little we know of es and manners, appear to have feasted, opitiated, mourned all at different times, way most befitting their several natures, case of those gods and festivals which ad in common.

ancient Persians alone of all nations had no ls, as they had no temples and no common ip. These 'Puritans of Polytheism,' who iped the sun only, and his representative h, fire, scorned show and pomp, and large atherings. A striking contrast to them in another hemisphere, by the ancient who were found to possess one of the ly developed calendars of festivals, scien- divided into movable and immovable feasts. strange and singular phenomenon among we may also mention here that 'of the als,' celebrated among the wild tribes of rica. At a certain time, all the graves and the remains of the bodies buried estival are taken out by the relatives, gether into a large common mound, at rejoicings and solemnities, to which all ouring tribes are invited.

had received the types of civilisation, n, and art from Egypt and the East generally, e developed them all in a manner befitting her n clime and the joyous genius of her sons. e time of the *Iliad*, two principal festivals the harvest and the vintage seem to have elebrated (ix. 250); but they increased with apidity, that in the days of Pericles they had d the number of a thousand; some indeed an epitome only of their memorable feats n, others restricted to one town, or pro- er profession, or sex, or to a few initiated. urring only at intervals of several years; re were still so many kept by the whole that ancient writers bitterly denounce s merry beginnings of a sad end, as the ut sure ruin of the commonwealth. Their dings proved true enough; and yet Greece certainly never have reached the highest ng nations, as far as literature, the arts, sophy are concerned, had it not been constant contests attached to her many She resisted Asia, because her citizens ays alert, always ready. The religious he festival homage offered to personified consisted mostly in the carrying about of the of the day to the sound of flute, lyre, and and in a sacrifice, followed by a general upon certain portions of the animal offered. followed scenic representations symbolising eds of the gods; after which came games and of all kinds—foot, horse, and chariot races, boxing, throwing, wrestling, &c. Separate accounts are given of some of the more remarkable Greek festivals. See BACCHUS, ELEUSINIAN MYSTERIES, PANATHENAIA, &c. There were also special times set aside for the 'Holy Games' proper. The most important of these were the Olympian, the Pythian, the Nemean, and the Isthmian. (See these heads.) As all these festivities were provided out of the public purse—from the confiscated estates of the 'tyrants' and political delinquents—the individual did not suffer more than a welcome interruption of his usual business, and under that genial sky the penalty to be paid for occasional indolence was not too heavy.

Rome, founded amid pastoral festivities in honour of some god Pales, adopted and acclimatised, as she went on from conquest to conquest, the foreign deities, exactly as, with her usual prudence and practical sense, she conferred her right of citizenship on her foreign inhabitants, and on whole nations subjected to her rule. Her yoke was thus less galling to the new provinces, while at the same time the populace at home found sufficient distraction in the many ancient and newly imported festivals, with their quaint rites and gorgeous pageantry. Yet the Romans—more parsimonious and abstract by nature than the vivacious Greek neighbours from whom they had accepted the greatest part of their religion—never exceeded in their festivals the number of one hundred, and in these, again, a distinct line was drawn between civil and religious ones. Some of the principal religious festivals were the Sementina, on the 25th of January the rural festival of the seed-time; the Lupercalia, in honour of Pan; the Cerealia; the night festival of the Bona Dea; Matronalia; Minervalia; &c. To the purely civil ones belong the Janualia, the 1st of January and the new-year's day, when the new consuls entered upon their office, and friends used to send presents (*strenæ*) to each other; the Quirinalia, in memory of Romulus, deified under the name of Quirinus; and the Saturnalia, in remembrance of the golden age of Saturn, beginning on the 19th of December. The celebration of these festivals was in all respects imitated from the Greeks, with this difference only, that the games connected with them became, with the pre-eminently bellicose Romans, terribly lifelike images of war. Their sham sea-fights; their pitched battles between horse and foot, between wild beasts and men; their so-called Trojan games, executed by the flower of the nobility; their boxing-matches (with gloves that had lead and iron sewed into them): circus, arena, and amphitheatre gave, especially in later times, the greater satisfaction the greater the number of victims.

It is one thing only that monotheism has in common with polytheism with respect to its festivals—namely, that they are with each the religious expression of human joy or human sorrow. But if the former, with a dim misgiving of some awful and supreme power, invited the multifarious governors of the many provinces of nature to partake, as guests, of bodily and intellectual feasts, *together* with their hosts; monotheism, in binding up all fear and all hope, all gratitude and all awe, which moved the heart of man, in one almighty Creator, Mover, and Maintainer of all things, celebrated its festivals in honour of this omnipresent Spirit with a veneration, a purity, and a lofty elevation, such as the worshippers of star, animal, or image never knew. With the first and strictest monotheists, the Hebrews, whose very existence as a nation was traced to the special and miraculous interference of this highest and only God, the remembrance of that great event, their liberation from Egypt, and the momentous period of preparation in the desert which followed it, mingled with almost all their religious [illegible] festivals, and infused [illegible] and fervent gratitude; [illegible] same time [illegible] ever before their [illegible] and their aim [illegible] priests and a holy [illegible]. The Hebrew [illegible] of a historical, [illegible] political nature; but they [illegible] characteristics, and [illegible] by the same religious idea, and the same [illegible] to one and the same [illegible] connected with their festivals were no [illegible] and no representations of a god's deeds, no [illegible] no mystery and no sensuality. [illegible] of the day, and a special occupation with the [illegible] law, were the visible signs of the [illegible]. The influence of the number seven [illegible] met with among most eastern nations [illegible] in the recurrence of many of the Jewish [illegible]. See SEVEN. The Sabbath, the first and most important of these septenary festivals, is treated [illegible] under its own head. Of the service in the temple, and of the way in which this and the other festivals were and are kept after the destruction of the temple, something will be said under Hebrews and Jews. The most exalted of new-[illegible] was that of the first day of the seventh month, the day of remembrance of the sounding of trumpets' Lev. xxiii. 24), to which in later times, when the Seleucidian era was introduced (the Syrian year beginning with the autumnal equinox), the name of Rosh hashana (New Year) was given; notwithstanding that in Exodus xii. 2, Nisan is spoken of as the first month of the year. After a [illegible] years of labour, the earth, too, was to celebrate its Sabbath year: what it produced spontaneously belonged to the poor, the stranger, and to animals. It is remarkable that even Alexander the Great and Cæsar remitted the taxes of Judea in this year of [illegible]. After a revolution of seven times seven years, the year of Jubilee or Jobel was celebrated, in which all the Hebrew slaves were set free, and all land which had been sold in [illegible] was restored to the former owners, in [illegible] equilibrium in the families [illegible] intact. (These two [illegible], according to the Talmud, [illegible] the Babylonian captivity.) The [illegible] and historical festivals [illegible] whence the Arab. *Hajj*, [illegible] Pesach (Passover), Scha-[illegible] Weeks), and Succoth (Feast of [illegible] every male was [illegible] and offer some of [illegible] sacrifices [illegible] historical festivals, [illegible] the feast of [illegible] the articles on [illegible] taken of the [illegible] treated fully and [illegible]. They were [illegible] in the course of time, [illegible], but always with [illegible] holy person-[illegible] was transferred from [illegible] Day of Joy, or [illegible] Jewish fasts of [illegible] Wednesday [illegible] time, both [illegible] especially in [illegible] took the place [illegible] law-giving at Sinai, became the festival of the outpouring of the Holy Ghost and of the inauguration of the Covenant.

In the course of the 4th c., two new festivals introduced: Epiphany (q. v.), which originat the East; and that of the Nativity or Chri (q. v.). Circumcision, Corpus Domini, the fes of the Cross, of Transfiguration, of the Trinity many others, are of still later date. The vene felt for Mary as the 'Mother of God,' foun expression likewise in the consecration of days to her special service and worship; su that of her Presentation, Annunciation (L Day), Assumption, Visitation, Immaculate C tion (q. v.), and many minor festivals, ove above the Saturdays, which in some parts entirely dedicated to her, in order that the M might have her weekly day like the Son. Be these, there were festivals of Angels, of Ap Saints, Martyrs (on the supposed anniversa their death, called their birthday, *dies natali* Souls, Ordinations, &c.

Celebrated at first with all the primitive simp of genuine piety, most of these festivals were ere invested with such pomp and splendour that surpassed those of the ancient Greeks and Ro Burlesque, even coarse and profane representa processions, mysteries, and night-services, we some places, although unauthorised by the ge church, connected with them, and voices withi church loudly denounced these 'pagan pract Ordinances forbidding mundane music and fe singers for divine service were issued, the were transformed into fasts, days of abstinence penance were instituted, partly as counter but with little result. Nor did the prodi increase of these festive occasions, and the r with which abstinence from labour was enforce most cases, fail to produce the natural result indolence and licentiousness among the large of the people. Bitter and frequent were the plaints throughout Christendom; but although men like Archbishop Simon of Canterbury (13 Petrus de Alliaco, Nicolaus of Clemangis, did utmost to obtain a reduction of these festive sions, which overspread well-nigh the whole yea was only after the most decided and threaten demands, such as that pronounced by the G Diet of Nurnberg in 1522, that Pope Urba prevailed upon to reduce the number for C Christianity (1642). Benedict XIV. (1742), C XIV. (1773), followed in the same direction. the change produced both in their number an the manner of their celebration through the Ref tion, we must forbear to enlarge here.

The Christian festivals have been divided v ously: into *feriæ statutæ* (returning annually at times), *indictæ* (extraordinary, specially proclaim *duplicia* (double reminiscence, or of higher im ance), *semiduplicia* (half doubles), &c. An division is into weekly and yearly feasts, these being subdivided into greater and minor, or movable and immovable. There is also a distinct made between *integri* (whole days), *intercisi* (h days), &c.

The only trace of the ancient manner of dating festival from the eve or vesper of the previous a practice discontinued since the 12th c., w the old Roman way of counting the day fr midnight to midnight was reintroduced, survives the 'ringing in' of certain days of special solem on the night before, and in the fasts of the vigils

On some of the principal Mohammedan festiv partly based upon those of the Jews and Christia such as the weekly Friday, the Yom Ashoora (Jewish Day of Atonement); the Birthday of ophet (Molud An-Nebee), that of Hussein, of ohammed's granddaughter Zeyneb, of the Night the Prophet's Ascension to Heaven (Leylet Al-earag), the Night of the Middle of the month aabân, in which the fate of every man is con- med for the ensuing year; the Eed Al-Shagheer Ramadan-Beyram, at the end of the Ramadan sta, and the Eed Al-Kabir, or the great festival the Sacrifice (Kurban Beyram), see MOHAM- MEDANISM. nds with which the heads of the animals, the &c., used to be decorated. The festoon along with bulls' heads on the frieze of the e of Vesta at Tivoli. The fig. is an example of sance festoon, from the library of St Mark Venice.

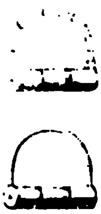
STUS, SEXTUS POMPEIUS, a Latin lexico- er, of the third or fourth c. of our era, is one most important ancient authorities we have Latin language. He made an epitome of the work of Verrius Flaccus, *De Verborum Sig- tione*. This compilation, which was arranged etically in 20 books, was still further abridged oiled in the end of the 8th c. by Paul, son rnefried, commonly called Paulus Diaconus. great work of Flaccus has unfortunately entirely d, and of the abridgment made by Festus, single MS., and that in a deplorably imper- condition, has survived. It came from Illyria, fell into the hands of Pomponius Lætus, a ished scholar of the 15th century. It ulti- passed into the library of Cardinal Farnese, na, and is now preserved at Naples. The work, e of all its imperfections, is a grand storehouse wledge on points of mythology, grammar, and es. All previous editions of F. are of little compared with that of K. O. Müller (Gött. in which he has made use of the Farnese MS. other sources, distinguishing the value of each.

TICHISM is the worship of a *fetich*. The fetich comes to us from the Portuguese, who re the first Europeans that traded on the west t of Africa, and who expressed their idea of the n of the natives by the Portuguese word , 'magic.' This word, somewhat modified, d into the French language, through Brosse's , *Du Culte des Dieux Fétiches* (Dijon, 1760), and from him into German, through the medium of Pistorius (Stralsund, 1785). The term has now received European recognition. A fetich is anything in nature or art to which a magical power is ascribed, e. g., stones, carved figures, or certain parts of plants, animals, &c. In this general sense fetichism coincides with the belief in charms—a belief which is also to be found among monotheistic nations. The first step *out of fetichism*, is when ignorant tribes cease to be satisfied with believing merely in the magical power inherent in their fetiches, and begin to ascribe a certain conscious operation to the objects of their reverence, especially to the fetiches in the forms of beasts or men. In this way the fetich becomes an idol, and fetichism an idolatry. The lowest form of such idolatry is where the savage does not hesitate to throw away, to chastise, or even to destroy his fetich, if it does not appear to gratify his desires. The reverence for sacred woods, mountains, streams, &c., which formed part of the religion of the old Greeks, Celts, and Germans, is not fetichism proper, but rather belongs to the worship of nature.

FETID LIMESTONE, a variety of limestone which gives out, on being violently rubbed, or struck with a hammer, a smell like that of sulphuretted hydrogen gas. It has a dark colour, produced very probably from the perishable portions of the animals whose hard skeletons compose the rock. This animal matter may perhaps also be the cause of the disagreeable smell. Stinkstone or Swinestone have been likewise employed as characteristic names for this limestone.



Fetlocks.

FETLOCK, or FETTERLOCK. English heraldic writers speak of a horse fetlock or fetterlock, and represent it thus. It seems to have been an instrument fixed on the leg of a horse when put to pasture, for the purpose of preventing him from running off. In Scotch Heraldry, a hoop is usually substituted for the chain, and the fetlock is represented thus, as in the arms of Lokkert (Lockhart) of Barr, given by Sir David Lindsay; Argent, on a bend sable three fetterlocks *or*. Some branches of this family carry a man's heart within the fetterlock, one of the heads of it having accompanied Good Sir James Douglas with King Robert the Bruce's heart to Jerusalem (Nisbet, i. p. 325).

FEU AND FEU-DUTY. A feu may be described, in familiar language, as a right to the use and enjoyment of lands, houses, or other heritable subjects, in perpetuity, in consideration of an annual payment in grain or money, called *feu-duty*, and certain other contingent burdens called casualties of superiority (see CASUALTY). Though a feu was frequently used to express any kind of tenure by which the relation of superior and vassal was constituted, in its narrower meaning, which we have here indicated, and which is that in which it is now almost exclusively used, it was opposed, on the one hand, to those tenures in which the return consisted of military or other personal service (ward and the like), and on the other, to those in which the return was illusory (blanch), the only object of which was to preserve the relation of superior and vassal. A feu, in short, was a perpetual lease—a feu-farm, as it was often called—by which the tenant became bound to pay a substantial consideration, and his rights under which he might forfeit, as the penalty of non-payment. In the present day, the disposal of land in feu is practically a sale for a stipulated annual payment, equivalent to chief rent. It is in this light, accordingly, that feus are generally regarded in

e our description of it from below,
ng the position of the simple land-
han by adopting the monarch in whom
ated, and from whom, in a technical sense,
posed to flow (see ALLODIUM), as our
departure. The latter course has been
ctly adhered to by English writers, from
nstance that, subsequent to the Conquest,
territory of England was regarded as the
of the conqueror, and was by him divided
his barons, and by them amongst their
s, an arrangement which was somewhat
to England (see ALLODIAL), whereas the
tem, in its essentials, was common to the
Europe. A feudal proprietor, then, or feud-
a person who held his lands from another,

were free tenants, farmers in the modern
ugh personal services to the proprietor
n almost every case constituted a portion
nt which was paid. Latterly, when the
subinfeudation was introduced, many of
r tenants came to stand to the baron,
the domain, very much in the relation
are about to describe as subsisting
him and his lord paramount. From
ants-at-will, scarcely less subject to his
and exposed to his caprices than the
villeins of the lowest class, they became
their lord, and free citizens of what thus
developed itself into a feudal monarchy
. The tenure by which this latter class
ands was generally known in England
as Free Socage (Stephen's *ut sup.* i. 205 *et seq.*). The castles by which the banks of the Rhine are studded along its whole course, from Bonn to Bingen, with their villages and parish churches, for the most part in the condition in which they were erected centuries ago, afford the most numerous and perfect examples of the arrangements of the feudal period which are perhaps anywhere to be met with. The possessors of these castles stood in a magisterial as well as a proprietary relation to their dependents. They exercised jurisdiction, extending even to the infliction of capital punishment, either in person or by means of officers whom they appointed for the purpose; and the castle was in general furnished with dungeons and other appliances for carrying their sentences into execution. Towards each other they stood in the relation of equals, or peers (Lat. *pares*); they were neighbours, simply, and friends or enemies as the case might be—too often the latter. But towards their immediate feudal superior, the count, marquis, duke, or whatever might be his title, to whom the government of the whole district belonged, they all stood in a relation which brought them in contact, and in some degree bound them to each other. Of him they held their lands on conditions somewhat similar to those on which they let them out to their own dependents. At first, as we have said, they were only tenants for life; but their rights in most countries very early assumed a hereditary character, the dominant proprietor's rights, on the death of a tenant, being continued to the exaction of certain dues from his son and successor, as a consideration for conferring on him, or rather for confirming to him, the feu which his father had held. Where the feu, fief or feoff, as it was sometimes called from the mode of admission feoffment, or, as it is said in Scotland, infeftment (q. v.) - descended to a female, the dominant proprietor was entitled to control her marriage, for the purpose of procuring himself a sufficient and trustworthy vassal; a privilege which, like all those of the lord, was latterly converted into a mere pecuniary claim. When the lord paramount, or suzerain, as he was called, held his court of justice, his vassal barons were the judges, being all on a footing of equality, or *pares curiæ*, as it was called. When he made war, either on his own account, or as furnishing a contingent to the army of the state, in such cases as in the national wars between France and England in the 12th and 13th centuries—which were the earliest instances of really national wars—his vassals were bound to attend him in person, and to furnish each the contribution of men, horses, arms, and other materials of war for which he was liable by the tenure on which he held his lands. In addition to these services, he was bound to watch and ward his castle, a duty which the minor barons almost invariably imposed on their vassals when the system of granting feus extended downwards to the class of persons who had formerly been mere tenants-at-will. Then there were certain dues which were almost always exigible from the vassal, such, e. g., as contributions towards providing a ransom for his lord when in captivity, for enabling him to celebrate the marriage of his eldest son with due pomp, or to provide a suitable dowry for his daughter. If these dues were not paid, the land reverted to the dominant proprietor, in relation to whom the vassal all along was a mere usufructuary. So far were the conditions of feudal holdings from being always the same, that no less than eighty different tenures have been enumerated; the onerous character of which varied from what was merely nominal, e. g., the payment of a white rose or a

pair of spurs, 'if asked merely,' up to what was a rent in some degree equivalent to the value of the land. For an account of the manner in which the feudal system affected the constitution of land rights and the conveyance of landed property, and still affects them, see CONVEYANCING.

Inferior to all the classes of society in feudal Europe of which we have hitherto spoken, there is reason to fear that there existed almost everywhere, in the earlier times, a class of the positively unfree. The lot of those who were in absolute slavery excluded them from the influences of feudality as a legal and social institution—'they were not reckoned,' says Palgrave, 'amongst the people'—but their existence is by no means to be left out of account, in forming to ourselves a picture of European society in feudal times. Of the condition of this class, as forming the substratum of feudal society, we shall have a pretty accurate conception from the following passage, in which Lappenberg describes them in Anglo-Saxon times, if we bear in mind, on the one hand, that subsequently to the Conquest their ranks were probably swelled by such of the Anglo-Saxon population as was in absolute poverty; and on the other, that their position, in all the countries of Europe, was gradually ameliorated by the influences of Christianity, the spirit if not the letter of which has everywhere proved hostile to slavery. 'One class of the Anglo-Saxon population, at the period of the Norman Conquest, consisted of the unfree or servile (*theowas, esnas*), whose number, as registered in Domesday-book, was little above 25,000. Of these, the majority were in a state of slavery by birth, whose forefathers had been either Roman slaves, British prisoners of war, or other enemies. Others, denominated, *wite-theowas*, or penal slaves, had been freemen, but reduced by the sentence of the law to the servile condition, on account of debt or delinquency. (Palgrave *ut sup.* i. 28.) The master had the right of selling the theow in the country, but not beyond the sea, even if he had perpetrated crime. In other respects, the condition of the servile seems to have differed little from that of the indigent free slaves who had a special wergild, half of which fell to the master and half to the kin.' (Thorpe's Lappenberg, ii. p. 320.) It is probable that the vast majority of the servile class in Anglo-Saxon, and even in Norman times, consisted of persons of Celtic blood. (Palgrave *ut sup.* p. 26.) In proof of this fact, Lappenberg remarks that their numbers diminish as we recede from the Welsh border and from Cornwall, the places in which the Celtic or original British population is known to have taken refuge.

The social elements which counteracted and mitigated the influences of feudality in mediæval life, were monarchy, the church, which vigorously promoted the emancipation of the unfree, and above all, the growing wealth, power, and importance of the commons. In order to free himself from the rude and insolent dictation of his great feudal vassals, the king, in almost every European state, courted the alliance of the town communities, who had remained more in the condition in which they had been left by the Romans than the inhabitants of the country, and who were consequently all along more or less opposed to the growth and influences of feudality. See MUNICIPIUM. By their aid, even before the formation of standing armies, something approaching to executive power was placed in the hands of the sovereign. He was thus enabled to appoint and enforce the decrees of independent judges of his own, who in the earlier time were generally churchmen, and thus greatly to circumscribe the power and influence of all classes of feudal proprietors over their dependents. Though the period of bloom of the feudal system was, as we have said, from the 9th to the 13th centuries, in most of the countries of Europe, it everywhere, in many of its features, long survived the latter period. Even considered as a social, and not merely as a legal institution, in which latter capacity it still exists, it was in many respects in vigour in Scotland down to the year 1747, when military tenures were abolished by statute, as dangerous to public tranquillity.

FEU DE JOIE, or 'running-fire,' a discharge of musketry into the air, made in honour of a victory or other great occasion. It commences with the right-hand man of the line, who discharges his rifle, and is followed successively, at scarcely perceptible intervals, by the men on his left, until the extreme left of the line is reached. The effect mainly depends on the regularity with which the slight interval between the discharges is preserved.

FEU'ERBACH, PAUL JOHANN ANSELM, RITTER VON, one of the most distinguished criminal jurists of Germany, was born at Jena 14th November 1775. Brought up at Frankfurt-on-the-Maine, where his father was an advocate, and educated in the gymnasium there, he went in 1792 to Jena, where he cultivated his mind by the study of philosophy, and then devoted himself to positive law. In 1798 he appeared as criminal jurist in a work *On the Crime of High Treason*, and in the following year he began to deliver lectures in the university of Jena. In his lectures and published writings, he introduced into criminal jurisprudence a new method of treatment, which was systematised in his Compendium of German Penal Law (*Lehrbuch des Gemeinen, in Deutschland geltenden peinlichen Privatrechts*, Giessen, 1801; 14 Aufl. von Mittermaier, 1847). This celebrated work placed F. at the head of a new school of jurists, who maintain that the decision of the judge in every case ought to be determined solely by an express deliverance of the penal law, never by his own discretion, and who on that account obtained the name of Rigorists. In 1801 F. was appointed ordinary professor in Jena, but in 1802 accepted a call to Kiel. In 1804 he was removed to the university of Landshut; but next year, having received a commission to prepare a penal code for Bavaria, he was [illegible]ferred to Munich as privy referendary for the [illegible]terial, judicial, and police departments; and in [illegible] was appointed privy-councillor. The new [illegible] code which he planned for Bavaria (*Strafge[illegible] für das Königreich Baiern*, München, 1813), rec[illegible] after a few modifications, the royal approval, was taken as a basis in the emendation of criminal law of several other countries. Duri[illegible] period also, he published his Remarkable C[illegible] Criminal Law (*Merkwürdige Criminalrecht[illegible]* Bde., Giessen, 1808–1811), which first led [illegible] to a deeper psychological treatment of such ca[illegible] In 1812, he published a work on Trial by [illegible] which a second volume, on the Judicial Pro[illegible] of France, was added in 1825, as the res[illegible] of a [illegible] to Paris in 1821. In 1817 he bec[illegible] president of the Court of Appeal in B[illegible] afterwards first president of the Court o[illegible] at Anspach for the Rezat district. In [illegible] published a work on the unfortunate Kaspar [illegible] whose mysterious fate had strongly attra[illegible] interest. He had just edited a collection of his miscellaneous writings, when he died at F[illegible] on-the-Maine 25th May 1833. An intere[illegible] of F. has been written by his son, Lud[illegible] *und Wirken Anselm von Feuerbachs*, 2 [illegible] 1852). F. left, besides three daughters, five [illegible] who have all distinguished themselves in Ger[illegible] literature.

FEUERBACH, LUDWIG ANDREAS, German philosopher, fourth son of the preceding, was born at Anspach, 28th July 1804. After studying theology for two years at Heidelberg under Paulus and Daub, in 1824 he was attracted to Berlin for the purpose of hearing Hegel, and soon after he abandoned theology, with the view of devoting himself entirely to philosophy. In 1828 he became *privatdocent* in the university of Erlangen, but in a few years quitted the academical chair, and gave up his whole time to literary labour. In a small anonymous work (*Gedanken über Tod und Unsterblichkeit*, Nürnberg, 1830), which attracted little attention when it appeared, he indicated that he had already gone beyond the standpoint of his master Hegel, by combating the doctrine of immortality. During the next few years, he published three works on portions of the history of philosophy, treating severally of the period between Bacon and Spinoza, of Leibnitz and of Pierre Bayle. But these historical works only paved the way to a critical investigation into the nature of religion and its relation to philosophy, the results of which have been given to the world in several works well known to speculative theologians. The most celebrated of these is his work on the Nature of Christianity (*Das Wesen des Christenthums*, Leip. 1841; 2 Aufl. 1843), which has been translated into English. Starting from the Hegelian doctrine, that the Absolute comes to consciousness only in humanity, F. denies to it any existence beyond the human consciousness, maintaining it to be merely the projection by man of his own ideal into the objective world, on which he feels his dependence. All authority above man, and consequently all moral obligation, is therefore consistently regarded as a delusion proceeding from man himself, and the highest good is explained as that which is on the whole most pleasurable. Yet even this highest good is further explained as consisting in resemblance to that ideal humanity which man creates for himself, and worships as God. A kind of ideal theism is therefore retained by F.; but when his doctrines were adopted by the mass of German communists, they degenerated, perhaps logically, into an actual atheism, which ignored any moral or social law imposed on the individual from any other source than himself. The works of F. have been collected, with additions and corrections to bring them into accordance with his later views (*F.'s Sämmtliche Werke*, 8 Bde., Leip. 1846–1851), and since then he has published a work entitled *Theogonie* (1857).

FEUILLANS, CONGREGATION OF, a reform of Cistercian order, remarkable as forming part of great religious movement in the Roman Catholic church during the 16th c., contemporary with and probably stimulated by the progress of the Reformation. The author of this reform was Jean de la Barriere, abbot of the Cistercian monastery of Feuillans, who, painfully struck by the relaxation of its discipline, laid down for himself a new and ch more austere course of life, in which he soon nd many imitators and associates among the brethren of his order. The rule thus reformed was, r considerable opposition from the advocates the old rule, approved, with certain modifica- ns, by Pope Sixtus V.; the reformed congre- ion, however, being still left subject to the ority of the abbot of Citeaux; and a con- was founded for them by Henry III. in the e St Honoré, Paris. The subjection to the at of Citeaux was removed by Clement VIII. 1595; and Urban VII., in 1630, separated the congregation into two branches, one for France, and the other for Italy, each under a distinct neral. The rules of both these branches were subsequently modified about the middle of the same century.

The celebrated revolutionary club of the Feuillants took its name from this order, the convent of which, in the Rue St Honoré, was the place of meeting for the members of the club. It was founded in 1790 by Lafayette, Sièyes, Larochefoucauld, and others holding moderate opinions. The club was at first called the 'Company of 1789,' and was intended to support the constitution against the ultra party. It reckoned among its members individuals of all classes, who took the constitution of England as their model. This opposition served, however, only to accelerate the revolutionary movement. On the 27th January 1791, on Count Clermont Tonnerre being elected president of the club, a popular insurrection broke out against it; and, on the 28th March, the assembly in the cloister was forcibly dispersed by a raging mob.

FEUILLETON (Fr.), literally a small leaf, signifies that portion of a political newspaper set apart for intelligence of a non-political character, for criticisms on art, literature, &c., and usually separated from the main sheet by a line. The feuilleton is an invention of the *Journal des Débats*, which, since the year 1800, has held an important place in the sphere of literary criticism. By degrees, the belles-lettres element began to pervade it; and the result was a species of light journalistic literature, in which Jules Janin became the acknowledged king. In the years immediately preceding the revolution, Feb. 1848, entire romances were spun out in the feuilleton. The *Constitutionnel*, in particular, made large pecuniary profits by the social romances of Eugene Sue, which it published in this manner. The French system has been imitated in England and Germany, though with less success than in France.

FEVEDA, an island of British Columbia, is situated in the Gulf of Georgia, between Vancouver Island and the continent. It is in lat. 49° 41′ N., and long. 124° W., measuring 32 miles in length by 2 in average breadth. It possesses a snug little harbour, which appears to be all the more valuable on account of the superior quality of the fuel which abounds on the spot. Its formation is understood to be wholly of limestone.

FEVER (Lat. *febris*, from *ferveo*, I grow warm, or perhaps from *februo*, I cleanse), a form of disease characterised principally by increase of the temperature of the body, which, however, requires to be estimated according to the state of the internal parts, rather than the external; the surface of the body, and particularly of the extremities, being not unfrequently cold rather than warm. Having regard to the heat of the surface only, fever has commonly been considered as passing through three distinct stages, more or less marked: 1, the cold or shivering stage; 2, the hot stage; 3, the sweating stage. This description is perfectly correct in most cases, but it requires to be qualified by the remark, that even in the cold stage of fevers, it is now well ascertained that the blood and the internal organs have an elevated temperature, as estimated by the thermometer introduced into the cavities of the body. In the cold stage of fever, accordingly, and even in the most violent ague, when the teeth are chattering with cold, and the whole surface is pale and clammy, the state of the system is well expressed by the aphorism of Virchow (the most ingenious and comprehensive of the modern exponents of the pathology of fever), to the effect that 'the outer parts freeze while the inner burn.' Increased heat of the body, therefore, is the most essential, perhaps the only essential phenomenon of fever. The other symptoms are loss of appetite, thirst, restlessness, and vague general uneasiness, often headache, and diffused pains in the back and limbs; a frequent pulse, which is sometimes also full and hard; a furred tongue, often with red margin; a flushed face and suffused eyes; vitiated secretions, and general derangement of the functions, with great debility of the voluntary movements of the limbs. The disease often commences with a shivering, or rigor, as it is technically called; this leads through the cold stage to the hot, which usually follows pretty rapidly, and is attended by all the febrile phenomena in their highest degree; the skin being often very pungently warm to the hand, dry, and harsh; by and by, the pores appear to open, moisture begins to bedew the surface, and the pungent heat disappears: the disease is then about to pass into its third or sweating stage, which ushers in the convalescence. For the special symptoms of particular fevers, see TYPHUS and TYPHOID FEVERS, SMALL-POX, SCARLET FEVER, MEASLES, AGUE, INTERMITTENT and REMITTENT FEVER, YELLOW FEVER.

Besides being thus the leading fact in a number of specific diseases, fever is also associated with many other forms of disease as a secondary or subordinate phenomenon, connected with an inflammation or other distinctly local disease. Thus, in Pneumonia (q. v.) or Enteritis (q. v.), fever is as much a part of the symptoms as pain or any other; and even in some chronic or long-standing diseases, as in Consumption (q. v.), a slow and consuming type of fever (see HECTIC FEVER) is found to be very generally present. Indeed, there is no condition which rules so large a part of the physician's duty, whether in the way of distinguishing diseases or of curing them, as this constitutional state. Fever is also very generally prevalent after surgical operations and injuries, of which it constitutes one of the leading dangers; and in midwifery practice, it is well known as constituting a large part of the risks of the puerperal state, whether in the slighter form commonly called *a weed*, or in the more dreaded and fatal, often epidemic, form of Puerperal Fever (q. v.).

The family of fevers is thus separated pretty naturally into two large groups, in one of which the fever is the greatly predominating fact, and determines the specific character of the disease: the local disease (if present) being quite subordinate, and usually secondary in point of time; the other, where the opposite order prevails, and the fever is obviously secondary. Hence the distinction embodied in medical language between *idiopathic* (i. e., self-originating, spontaneous) and *symptomatic* or secondary fevers. Fevers are also distinguished, with reference to their mode of diffusion, as Epidemic (q. v.) and Endemic (q. v.); or with reference to their supposed cause, as contagious, infectious, malarious, pneumonic, rheumatic, &c.; or with reference to their incidental symptoms and their peculiarities of course and termination (the presumed *specific* phenomena attracting, of course, particular attention), as eruptive (see EXANTHEMATA) or non-eruptive, bilious, gastric, enteric, mucous, putrid, malignant, typhoid, &c.

Among these distinctions, based upon the course of the fever, one demands particular notice, as involving an important law of febrile diseases generally, and of a large class of fevers of warm climates in particular. Periodic increase and diminution, or paroxysms of longer or shorter duration, with intervals of more or less perfect relief from all the symptoms, are characteristic of most diseases of this kind, but especially of those arising from
malaria, i. e., emanations from the soil,
under the influence of solar heat. The dur
the paroxysms and of the intervals, the c
intermission, or more partial *remission*, of sy
become in such cases the characteristic fa
mark the *type*, as it is called, of the fever
is accordingly distinguished as intermittent
tent, or continued; and, according to the
of the periods, Tertian, Quartan, Quot
(q. v.).

The true pathology, or ultimate essence
febrile state, is still a subject open to que
it is in accordance with modern physiol
fever as connected with some complex
of the functions on which the animal he
to depend—viz., the nutrition of the text
vital changes constantly in operation be

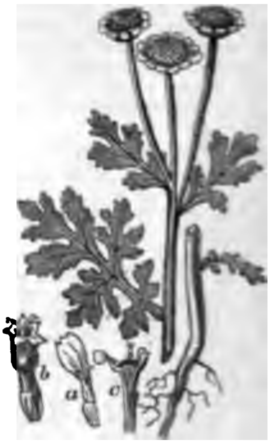
according to accurate thermometric obse
If such observations are corroborated and e
it will probably appear that the cause of fe
be found in an increased destructive decom
of the atoms of texture through the oxygen
at the lungs and circulated with the blood;
under the influence of a derangement of
system; which has been shewn by experi
have a very marked control over the gener
animal heat.

The treatment of fever will be considere
the separate forms already referred to.

FEVERFEW (*Pyrethrum partheni*
caria parthenium), a perennial plant, f
places and near hedges in Britain and
Europe. It is botanically allied to Ch
and still more nearly to Wild Chamomile
chamomilla), and much resembles these
properties, but differs in appea
its leaves being flat and com
its flowers smaller. Its habit o
stem much branched, and about
has a strong, somewhat aro



Common Feverfew (*Matricaria pa*
a, floret of the ray; *b*, floret of the disc; *c*, fr
toothed membranous pappus.

a popular remedy in ague, and from time immemorial has been used as an emmenagogue. It is employed in infusion, and is stimulant and tonic. A double variety is not uncommon in gardens. –Of the same genus with F. is the MAYWEED (*P. inodorum* or *M. inodora*), with leaves more resembling those of chamomile, but almost scentless, and large flowers, with white ray and yellow disc, very common in cornfields and waste places in Britain and throughout Europe.

FEVERWORT (*Triosteum perfoliatum*), a perennial plant of the natural order *Caprifoliaceæ*, having an erect, round, hairy, fistular stem, from one to four feet high, opposite ovato lanceolate entire leaves, axillary whorls of flowers, with tubular 5-lobed corolla, and leathery 3-seeded berries. It is a native of North America, where its dried and roasted berries have been occasionally used as a substitute for coffee; but it is chiefly valued for its medicinal properties, its roots acting as an emetic and mild cathartic. It is sometimes called *Tinkur's Root*, from Dr Tinkar, who first brought it into notice.

FEZ (Ar. *Fas*), the chief and most northerly province of the empire of Marocco, occupies the country between the Atlas Mountains and the Mediterranean. Its population is estimated at about 3,200,000, consisting of Berbers, Moors, Arabs, Negroes, Jews, and a few Europeans. The province is divided into fifteen districts. FEZ, the capital of the province, in lat. 34° 6′ N., and long. about 5° 0′ W., was founded by Muley Edris II., in the year 806 A.D., and was reckoned during the middle ages—when it was the capital of the kingdom of Marocco—one of the most magnificent and largest cities in the Mohammedan world. It is said to have contained about 90,000 dwelling-houses, and about 700 mosques, and was celebrated for its splendid public buildings, schools, and scientific institutions. On the removal of the court to Marocco, about the middle of the 16th c., F. gradually fell into decay. It is still, however, a place of considerable importance. The situation of F. is [illegible]lar; it lies in a valley, formed by surrounding hills into a sort of funnel, the higher parts of which are covered with trees, orange groves, and orchards. It is divided into Old and New F. by one of the upper branches of the Sebu, and has a population variously estimated at from 40,000 to nearly 100,000 souls. There are 100 mosques, of which the most important is that built by the Sultan Muley Edris, which contains his monument, and is an inviolable refuge for criminals, however guilty. On account of its numerous mosques and relics, it is regarded as the Holy City of the western Arabs. It has seven well-attended schools. The old palace of the sultan is large, but is now falling into decay. In other respects, the external aspect of F., with its numerous baths, caravanseras (of which there are about 200), and bazaars, resembles that of Mohammedan towns in general; the multitude of hotels and shops alone imparting to it a peculiar and more European character. A considerable trade is still carried on, by means of caravans, with the adjoining countries on the south and east, extending as far as Timbuktu. F. carries on manufactures of woollens, sashes, silk-stuffs, girdles, slippers, fine carpets, &c. Its artisans are also skilful workers in gold and jewellery.

FEZZÂN (more correctly, FESSÂN), an extensive oasis in the north of Africa, in 24°-31° N. lat., and 12 —18° E. long. It lies south of the regency Tripoli, and has a population variously estimated [illegible] m 75,000 to 150,000 souls. The north is for most part hills, but the hills are composed perfectly bare, black quartz sandstone, with no rivers or brooks among them, and the south is mainly a level waste of dry sand. Not more than a tenth of the soil is cultivable. In the neighbourhood of the villages, which are situated mainly in the wadies, wheat, barley, &c., are cultivated. Camels and horses are reared in considerable numbers. Lions, leopards, hyænas, jackals, wild-cats, porcupines, vultures, ostriches, buzzards, &c., are found in abundance. The inhabitants are a mixed race, of a brown colour, in many respects resembling the negroes, but are generally well formed. The original inhabitants belonged to the *Berber* family, but since the invasion of the country by the Arabs in the 15th c., the traces of this native North African element have gradually become very faint. The language spoken is a corrupt mixture of Berber and Arabic. The people are far behind in civilisation, and occupy themselves with gardening and the manufacture of the most indispensable necessaries of life. Considerable trade is carried on by means of caravans between the interior of Africa and the coast. F. is the Phazania of the ancients, against which the Romans, under Cornelius Balbus, undertook a campaign about 20 B.C. During the classic period, as well as in the middle ages, it was governed by its own princes who were at first independent, but afterwards became tributary to the pashas of Tripoli. In the year 1842, F. was conquered by the Turks, and since that time has remained a Turkish pashalic. Murzuk, the capital of F., is a well-built town, with broad streets and a population of 3000. Merchandise valued more than £21,000 annually changes hands here, and of that amount the slave-trade forms seven-eighths. Murzuk is now the great starting-point from the north for the interior of Negroland. Compare Barth's *Travels in Central Africa* (Lond. 1857), and also the descriptions given of Fezzân by Denham, Clapperton, Oudney, Richardson, Dr Vogel, &c.

FIAR. See FEE AND LIFERENT.

FIARS (a word said by Jamieson to be of Gothic origin, and to exist in the same form in Icelandic). The *fiars* prices in Scotland are the prices of the different kinds of grain of the growth of each county for the preceding crop, as fixed by the sentence of the sheriff, proceeding on the report of a jury summoned for the purpose, before whom the evidence of farmers and corn-dealers is produced. The values thus officially ascertained serve as a rule for ascertaining the prices of grain in all contracts where they are not fixed by the parties; and in many sales it is agreed to accept the rates fixed by the fiars. Ministers' stipends, in so far as they consist of grain, and crown dues, are also paid by the fiars prices of the county for each year. With a view to the latter, fiars, in former times, were struck in exchequer. An error in striking the fiars will not afford a ground of suspension.

The form of procedure in 'striking the fiars,' as it is called, is regulated by Act of Sederunt, 21st Dec. 1723, renewed 29th February 1728. The time fixed by this act for summoning the jury is between the 4th and 20th of February, and the verdict must be returned before 1st March, old style; which is generally considered too early, as before that time not much grain of the previous crop has been brought into the market. Mr Barclay, sheriff-substitute of Perthshire, in his Digest, gives the following account of this difficult and delicate process as practised in his county. 'In Perthshire, the fiars court is held on the last Friday of February, or the first Friday of March. The jury consists of eight heritors, a few farmers, and some neutral parties, especially one or two able to check the calculations.

An experienced accountant is sworn, and acts as such, but is not on the jury, and is paid a fee from the county rates. The list of the jury is shifted every alternate year, thereby giving sufficient release from duty, and yet securing persons skilled in the practice. Some years ago, it was arranged to take no juror who either paid or received rents according to the fiars; but this greatly limited the choice, and was complained of, and abandoned. All considerable dealers in Perthshire victual, whether resident in Perthshire or elsewhere, are uniformly summoned, and in addition, every person whose name is given in by whatever person interested.' As grain is commonly sold according to weight, one shilling being generally allowed on wheat for every additional pound-weight on every bushel; on an application by the farmers, it was agreed to determine the classification by taking a certain weight as the point of division. The first thing which the jury do is consequently to determine the point of weight. The witnesses are then sworn to the schedules, which they receive after harvest, and in which they insert every separate quantity of grain sold, with the dates and prices divided into first and second classes, according as the judgment of each witness dictates, and the weight of each parcel. The results of the separate schedules are inserted by the accountant in a general schedule, which is summed up by the accountant, such members of the jury as are capable assisting him. The result constitutes the fiars prices for the year. The same mode is not adopted in England; but weekly averages of *all* grain sold at public markets are ascertained and published in the *Gazette*, and this is without respect to the produce of particular counties. 9 Geo. IV. c. 60; 5 and 6 Vict. c. 14; 9 and 10 Vict. c. 22. See *Historical Account of the Striking of the Fiars in Scotland*, by George Paterson, Esq., Advocate, 1852.

FIA'SCO, a term borrowed from the Italian theatre, and now naturalised in France and Germany, besides being occasionally used by English writers. It signifies a failure to please on the part of an actor or singer, and is thus the opposite of *furore*, although why the word, which simply means a bottle, should come to be thus applied, is more than anybody knows. In Italy, it is not uncommon to hear an audience cry out, '*Old*, *old*, *fiasco*,' even when the singer has only made a single false note.

FI'AT, in English Law, a short order or warrant of some judge for making out or allowing certain processes.

FIBER. See MUSQUASH.

FI'BRE (Lat. *fibra*), a term of very common use as applied to objects of a stringy or thread-like character, whether of the animal, vegetable, or mineral kingdom. Minerals are often described as of a fibrous structure or appearance, in which there is, however, no possibility of detaching the apparent fibres from the general mass, or in which they are inflexible and brittle if detached: but a more perfect example of mineral fibre is found in *Amianthus*, a variety of ASBESTUS (q. v.). For the scientific use of fibre with regard to the animal kingdom, we refer to the article MUSCLE; for its scientific use with regard to the vegetable kingdom, to VEGETABLE TISSUE and to WOOD AND WOODY FIBRE. In its more popular, but perfectly accurate use, it includes the hair or wool of quadrupeds, the silken threads of the cocoons of silk-worms and other insects, the fibres of the leaves and of the inner bark of plants, and the elongated cells or hairs connected with the seeds of plants, the ordinary materials of cordage and of textile fabrics.

Of mineral substances, amianthus alone ha
used for textile fabrics, and that only to
limited extent. Animal and vegetable fibres
from the earliest ages, supplied man with c
and with cloth. How the invention took pla
only be matter of conjecture.

The animal fibres used for textile purpo
chiefly of the two classes already mentione
the wool or hair of quadrupeds, and (2) the
the cocoons of insects. To these may be ad
the Byssus (q. v.) of molluscs, but this class c
only the Byssus of the PINNA (q. v.) of the
terranean, an article of ancient and high repu
but more of curiosity than of use. The ski
intestines of animals, although sometimes t
or plaited for various uses, can scarcely be rec
among the fibrous materials afforded by the
kingdom. For information regarding the
obtained from the cocoons of insects, see SIL
SILKWORM. It is to the first class tha
greater number of different kinds of anima
used for textile purposes belong; and the w
the sheep far exceeds all the rest in impo
See SHEEP and WOOL. But the wool or hair o
quadrupeds is also to some extent used, as
Goat (see GOAT and ANGORA), the Alpaca
the Camel (q. v.), the Bison (q. v.), the Mu
(q. v.), the Yak (q. v.), and the Chinchilla (
all of which, except the last—and it has
doubtful claim to be mentioned—are, lik
sheep, ruminants. The hair of comparativel
animals is sufficiently long for textile purpo
can be procured in sufficient abundance to
it of economic importance. The warmth of
ing depends much on the fineness of the
and on other characters in which wool partic
excels.

The useful vegetable fibres are far more num
and various than the animal. They are o
from plants of natural orders very differ
each other; none of them, however, belo
the class of acrogenous or cryptogamous
They are obtained also from different parts of

into chair-bottoms, and the like; the roots
Agaves (q. v.) yield fibres useful for various
poses; but generally, the more valuable
obtained from endogenous plants are those of
leaves, either of the leaf-stalks—as Piassaba
and Gomuto or Ejoo fibre, both produced by
or of the blade of the leaf, as Pine-apple
Pita Flax, New Zealand Flax, Bowstring Hem
The fibres of the leaves of endogens being p
to each other, are easily obtained of sufficient l
for economical purposes; whilst the retic
fibres of the leaves of exogens, even if long en
which is comparatively seldom the case, can
separated for use. The *bast* fibres of
however, are often of sufficient length
separable. Their separation is gene
plished by steeping in water, or by fre
ing with water, so as to cause a par
the other parts of the bast and of t
covers it. But the fibres of end

general discoloured and injured by this process to a much greater degree than those of exogens, mere mechanical means are usually preferred for their separation, such as beating, passing between rollers, and scraping. The fibres of many leaves are separated by scraping alone. The fibres of *fruits*, as cotton, exist in nature in a separate state, like the wool or hair of animals, and require merely to be collected and cleaned.

A complete enumeration of the kinds of vegetable fibre applied to economical purposes would not be easy. Flax, Hemp, and Cotton have long had the pre-eminence. To these have recently been added New Zealand Flax, Jute, Sunn or Sunn Hemp, Coir, Pita Flax, Abaca or Manilla Hemp, Bow-string Hemp, China Grass, Piassaba, and many others. New kinds are continually being brought under notice, and to this industrial exhibitions and industrial museums have most beneficially contributed. New kinds, however, do not immediately command the attention they deserve. 'If a new product is sent into the market,' says Dr Royle, 'few of the regular customers will buy it, as they want that to which their machinery and manufactures are suited.' But for the judgment and enterprise of Mr Salt, it might have been long ere alpaca wool had obtained its present place among the materials of our manufactures; and there is much reason to think that many vegetable fibres, now little regarded, may yet in like manner be exalted to importance.

For the use of vegetable fibres in the manufacture of paper, see PAPER.

FIBROUS PLANTS. Without attempting a complete enumeration of plants which yield fibres employed for economical purposes, we give the following as a list which may be useful. Many of the subjects will be found treated in separate articles, or more fully noticed under the natural orders. The most important are indicated by capitals.

I. EXOGENOUS PLANTS.

1. *Fibres of the Fruit.*

Nat. Ord. *Malvaceæ.* COTTON, produced by species of *Gossypium.*

——— *Sterculiaceæ.* Silk cotton, or vegetable silk, the produce of *Bombax villosum*, &c.

——— *Asclepiadaceæ.* The silk-like down of the seeds of Virginian Silk (*Asclepias Syriaca*).

2. *Fibres of the Inner Bark or Bast.*

Nat. Ord. *Malvaceæ.* Deckanee Hemp (*Hibiscus cannabinus*).—Other species of *Hibiscus*, *Althæa cannabina*, *Sida abutilon*, &c.

——— *Sterculiaceæ.* A number of species of different genera; some of them cultivated to a small extent.

——— *Tiliaceæ.* JUTE (*Corchorus olitorius*, *C. capsularis*, &c.) The bast of some trees of this family, as the Linden or Lime (*Tilia Europæa*, &c.) is used for mats, ropes, &c. See BAST.

——— *Linaceæ.* FLAX, the produce of *Linum usitatissimum.*

——— *Leguminosæ.* SUNN, Jubbulpore Hemp, &c., the produce of species of *Crotalaria.*
Spanish Broom (*Spartium junceum*).
Bokhara Clover (*Melilotus arborea*).
Dhunchee (*Sesbania aculeata*).
Species of *Cytisus* (as Common Broom), Butea, *Parkinsonia*, *Bauhinia*, &c.

——— *Asclepiadaceæ.* Jetee (*Marsdenia tenacissima*).
Yercum or Mudar (species of *Calotropis*).
Virginian Silk (*Asclepias Syriaca*, *A. debilis*).
Other species of several genera.

——— *Apocynaceæ.* C [illegible] I [illegible] (*Apocynum cannabinum*).

Nat. Ord. *Urticeæ.* Common Nettle (*Urtica dioica*) and other species of *Urtica.*
Species of *Bœhmeria*, one of them yielding CHINA GRASS Fibre.

——— *Cannabinaceæ.* HEMP (*Cannabis sativa*).
Hop (*Humulus lupulus*).

——— *Moraceæ.* The bark of some species of Fig.

——— *Coniferæ.* Inner bark and roots of some species of Pine and Fir.

——— Unknown. Buaze.

II. ENDOGENOUS PLANTS.

Nat. Ord. *Liliaceæ.*
NEW ZEALAND FLAX, fibre of leaves of *Phormium tenax.*
Bow-string Hemp, fibre of leaves of species of *Sanseviera.*
Fibre of leaves of species of *Aloë* and of *Yucca.*

——— *Amaryllideæ.* Pita Flax, fibre of leaves of *Agave Americana.*
Fibre of leaves of species of Fourcroya.

——— *Musaceæ.* Abaca or Manilla Hemp, and Plantain Fibre, obtained from leaves of species of *Musa.*

——— *Bromeliaceæ.* Pine-apple Fibre, Curratow, &c., fibres of leaves of species of *Bromelia*, &c.

——— *Pandanaceæ.* Fibres of leaves of Screw-pines.

——— *Palmaceæ.* COIR or cocoa-nut fibre, from husk of cocoa-nut. Fibre of cocoa-nut stem. Gomuto or Ejoo fibre, from leaf-stalks of Gomuto Palm (*Arenga saccharifera*).
Piassaba, from *Attalea funifera* and *Leopoldinia Piassaba* (the Chiquichiqui Palm).
Other fibres from leaf-stalks, &c., of many palms.

——— *Cyperaceæ.* Fibre from leaves of *Eriophorum cannabinum* (see COTTON-GRASS). Mats, chair-bottoms, &c., made of different *Cyperaceæ.*

——— *Gramineæ* or Grasses. Esparto (*Stipa tenacissima*).
Moonja (*Saccharum munja*).

FIBRINE is an organic compound, occurring both in animals and plants. In its chemical composition it closely resembles albumen and caseine, and it was until recently believed that these three substances possessed a common radical, to which the name *proteine* (from *proteuo*, I am first) was given, the proteine being regarded as the primary basis of all the tissues of the body. Hence we frequently find fibrine described as one of the proteine bodies.

Fibrine is mainly distinguished from the allied substances, albumen and caseine, by its separation in a solid state, in the form of extremely delicate filaments or lamellæ, from any fluid in which it is dissolved, very shortly after the abstraction of the latter from the organism.

Animal fibrine, which is of the greatest physiological importance, occurs principally in the blood, the lymph, and the chyle. In order to obtain it in a state of purity, we beat or stir the blood with a bundle of twigs, to which the fibrine adheres in strings. The impure fibrine thus obtained is then rinsed with water, boiled with alcohol and ether, to remove fatty matters— and dried. In healthy venous blood, it scarcely ever amounts to 3 in 1000 parts, its average quantity being 2·3. Small, however, as its amount is, it varies more than any other constituent of the blood, and in acute inflammatory diseases sometimes exceeds its average by five or six times. Moreover, arterial blood contains more fibrine than venous blood. In the lymph and chyle, it occurs in considerably less quantity than in the blood. In inflammatory exudations, we find fibrine in the contents of the serous cavities— as, for example, of the pleura and peritoneum—and on the mucous membrane (as in croup); in these cases, it usually occurs in a state of spontaneous coagulation.

There are good physiological reasons for believing that fibrine is formed from albumen, and not directly from the food; and as fibrine contains a little more oxygen than albumen, it has been inferred that it is formed from the latter by a process of oxidation. As, however, more fibrine is found in the blood in pneumonia—when a considerable portion of the lungs is rendered impervious to air—than in almost any other disease, we are inclined to adopt the opposite hypothesis, that the augmentation of the fibrine in inflammatory blood is caused by an insufficient supply of oxygen. When oxygen is abundantly introduced into the blood, the fibrine rapidly undergoes further transformations: on the other hand, when, in consequence of impeded respiration, the quantity of oxygen conveyed to the blood is not sufficient to effect the further normal oxidation or transformation of the fibrine, we have an accumulation of that constituent in the circulating fluid.

It has, however, been a disputed question, whether fibrine is produced in the elaboration or in the disintegration of the tissues. For the discussion of this subject, and of other points connected with fibrine, we must refer to Lehmann's *Physiological Chemistry*, vol. i. pp. 361—364.

The substance forming the mass of flesh or muscular tissue was formerly regarded as identical with coagulated blood-fibrine. The two substances are, however, chemically distinct, and the muscle-fibrine will be described under its new chemical name, SYNTONINE (from *sunteinein*, to contract or render tense).

FIBROUS TISSUE. See TISSUES.

FI'CHTE, JOHANN GOTTLIEB, an illustrious German philosopher, was born at Rammenau, in Upper Lusatia, 19th May 1762. His earliest years were marked by a love of solitary musing and meditation. When a mere child, he was wont to wander forth to upland fields, that he might enjoy the pleasure of gazing into the illimitable distance. In 1775, he was placed at the gymnasium of Pforta, near Naumburg; and in 1780 he entered the university of Jena, where he devoted himself at first to theology, but afterwards to philosophy. During the years 1784—1788, he supported himself in a precarious way as tutor in various Saxon families. Subsequently, he went to Zurich in a similar capacity, where he made the acquaintance of the excellent lady who afterwards became his wife, Johanna Maria Rahn. In 1791, F. obtained a tutorship at Warsaw, in the house of a Polish nobleman. The situation, however, proved disagreeable, and was thrown up by the fastidious philosopher, who next proceeded to Königsberg, where he had an interview with Kant, of whom he had become an ardent disciple. Here he wrote, in 1792, his *Kritik aller Offenbarung* (Critique of all Revelation), which he shewed to that philosopher, who praised it highly, but still maintained a certain air of reserve towards the enthusiastically earnest author, which pained the latter greatly. At Königsberg, F. was reduced to such straits for want of the means of subsistence, that he was forced to ask the loan of a small sum of money from Kant, which the latter was stoical enough to refuse. Things were now at the worst with F., and of course—according to the old adage—they began to mend. He entered the delightful family of the Count of Krokow, near Danzig, as tutor; was enabled to marry; and in 1794 was appointed to the chair of Philosophy at Jena, where he commenced to expound with extraordinary zeal his system of transcendental idealism. F., in fact, *preached* his philosophy as if he believed its reception essential to the salvation of his hearers. In 1795, he published his *Wissenschaftslehre* (Doctrine of Science), in which he clearly broke away from Kant, whose speculations did not seem to him sufficiently thorough, or, as Englishmen would say, *idealistic*. Indeed, as early as 1793, writing to Niethammer, he says: 'My conviction is, that Kant has only *indicated* the truth, but neither unfolded nor proved it.' An accusation of atheism, which F. fervidly but fruitlessly refuted, cost him his chair in 1799. In the previous year, he published his *System der Sittenlehre* (System of Ethics, Jena, 1798), considered by many to be his most mature work. He now removed to Berlin, where he delivered lectures on philosophy to a select auditory. In 1800, appeared his *Ueber die Bestimmung des Menschen* (On the Destiny of Man). In 1805, he obtained the chair of Philosophy at Erlangen, with the privilege of residing at Berlin in the winter. Here he delivered his celebrated lectures, *Ueber das Wesen des Gelehrten* (On the Nature of the Scholar, Berlin, 1805—1806). In the same year, appeared his *Grundzüge des gegenwärtigen Zeitalters* (Characteristics of the Present Age); and in 1806, his *Anweisung zum seligen Leben oder die Religionslehre* (The Way to the Blessed Life, or the Doctrine of Religion). But F. was a patriot as well as a philosopher. The victories of Napoleon at Auerstadt and Jena drew forth the famous *Reden an die Deutschen* (Addresses to the Germans). These addresses were full of the most exalted enthusiasm. F. 'laments that his age has denied him the privilege accorded to Æschylus and Cervantes, to make good his words by manly deeds.' The Prussian king appreciated the zeal of the eloquent metaphysician, and, on the restoration of peace, requested him to draw up a new constitution for the Berlin University. In 1810, the university was opened, with a host of brilliant names, F., Wolff, Müller, Humboldt, De Wette, Schleiermacher, Neander, Klaproth, and Savigny. By the votes of his colleagues, F. was unanimously elected rector. Here, as at Jena, he laboured with unremitting energy for the suppression of all those customs which he deemed barbarous in themselves, and incompatible with the true idea of a scholar. In 1813, the war of independence broke out, and the hospitals of the Prussian capital were soon crowded with patients. F.'s wife was one of the first who offered her services as a nurse. For five months, she tended the sick with all the patient tenderness and devotion of her nature. At last, she was seized with fever, 3d January 1814. After a fearful struggle, she recovered; but her husband caught the infection, and in spite of all remedies, sank under its influence, and died 27th January 1814. It is difficult to speak calmly of Fichte. His life stirs one like a trumpet. He combines the penetration of a philosopher with the fire of a prophet, and the thunder of an orator; and over all his life lies the beauty of a stainless purity. See *Fichte's Leben und literarischer Briefwechsel* (published by I. H. Fichte, 2 vols. Sulzb. 1830—1831); and W. Smith's *Memoir*, published by Chapman and Hall (Lond. 1848). The fundamental notion of the idealism set forth in F.'s writings, at least in the earlier of them, is the sole reality of the *Ego* or I, which posits both itself and the *Non-ego*, or Not-I. (The phrase 'to posit,' it ought to be observed here, signifies in German metaphysics, to present to the consciousness. Hence, when it is said that the *ego* posits itself, the meaning is, that the becomes a fact of consciousness, which it can become through the antithesis of the non-

Under this ego, however, must not be understood, according to the usual misapprehension, the human and finite, but the 'absolute subject-objectivity' (*absolute subject-objectivität*), the eternal, universal reason. The ego is the absolutely productive, which, however, would not attain to consciousness of itself - i.e., of its infinite spontaneous activity, did it not at the same time place in contrast to itself, and as an impediment (*anstoss*) and limit to its activity, the non-ego - i. e., the objective world, or nature. The ego, in so far as it is determined by the non-ego, is the intelligent ego, and, as such, the subject of theoretical science; the ego, on the other hand, as determining the non-ego, is the subject of practical science. Freedom, absolute, spontaneous activity, for its own sake, is not with F., as with Kant, the condition and pre-supposition of moral action, but is itself the highest expression of the problem of the moral law. To realise this self-activity, however, the ego requires an external world of objects, in order that in them as limits it may become conscious of its own activity. To this idealistic system of ethics it has been plausibly—some think unanswerably—objected that it makes the non-ego be required as the condition of morality, and at the same time represents the removal of this condition as the aim of moral effort. With respect to the idea of right, F.'s theory of freedom, in its fundamental principles, attached itself to the Kantian theory of freedom as the innate and primitive principle of right. Generally speaking, F. makes that which, from the stand-point of ordinary consciousness, we call the world, merely a product of the ego; it exists only through the ego, for the ego, and in the ego. F. himself afterwards modified or extended his system, so as to bring out more prominently the *theistic* character of his metaphysics. The transition to this later stage of F.'s philosophy is seen in his *Bestimmung des Menschen* (Destination of Man). It arose from the intense religiosity of his nature. F. was essentially a worshipping nature, and though he never ceased to be a philosopher, the untiring aspiration of his later years was to realise in his own way the belief of the great Jewish lawgiver: 'The eternal God is thy refuge, and round thee are the everlasting arms.' A popular exposition of his philosophy is given in his *Anweisung zum seligen Leben*. It is set forth in a strictly scientific manner in the lectures published in the *Nachgelassenen Werke*, edited by I. H. Fichte (3 vols. Bonn, 1834 - 1835), in which his *Speculative Logik* and his revised theory of right and morals are particularly deserving of attention. Although F. never, strictly speaking, formed a school, and though his system has only been adopted by a few, such as J. B. Schad, Mehmel, Cramer, Schmidt, and Michaelis, his influence upon the subsequent development of German philosophy has been very important. F.'s collective works have likewise been published by his son, I. H. Fichte. His popular works have been translated into English by W. Smith, and published by J. Chapman of London in his 'Catholic Series.' Their titles are—*The Destination of Man*, *The Vocation of the Scholar*, *The Nature of the Scholar*, *The Way to the Blessed Life*, and *The Characteristics of the Present Age*.

FICHTE, Immanuel Hermann, son of the former, and professor of philosophy in the university of Tübingen, was born in 1797, and early devoted himself to philosophical studies, being attracted by the later views of his father, which he considers were essentially *theistic*. He also attended the lectures of Hegel, but felt averse to his pantheistic tendencies, and leaned more to Schleiermacher and Schelling. Occupied at first as a teacher, F. was appointed professor of philosophy in Bonn in 1836, and in 1842 received a call to the university of Tübingen. His chief works are—*Beiträge zur Characteristik der neuern Philosophie* (1841), *Grundzüge zum Systeme der Philosophie* (Heidel. 1839—1847); *System der Ethik* (Leip. 1850—1851), and *Anthropologie, oder die Lehre von der Menschlichen Seele* (Leip. 1856). He suggested meetings of philosophers similar to those held by physicists; and at the one held at Gotha, 1847, he delivered an address *On the Philosophy of the Future* (Stuttg. 1847). The great aim of his speculations has been to find a philosophic basis for the personality of God, and for his theory on this subject he has proposed the term *Concrete Theism*, to distinguish it alike from the abstract theism which makes God almost an unreality—a barren aggregate of lifeless attributes; and on the other hand, from the all-absorbing pantheism of Hegel, which swallows up the human and the divine in its own inapprehensible totality. Recently, F. has published an important work, *Zur Seelenfrage, eine Philosophische Confession*, which has been translated into English by J. D. Morell, under the title of *Contributions to Mental Philosophy* (1860), for an account of which see art. CONSCIOUSNESS. During the movements of 1848, he issued several political tracts. The principle of F.'s politics is not unlike Dr Arnold's maxim. He holds that there is only one kind of real conservatism, that of constant well-planned reform; and that all revolution consists either in attempts to precipitate prematurely the future, or to go back to ideas that are effete, the last being only the chrysalis form of the first. The state, 'according to the idea of benevolence,' belongs to the future. The regeneration of Christianity would consist in its becoming the vital and organising power in the state, instead of being occupied solely, as heretofore, with the salvation of individuals. To this recent school of philosophy belong Weisse, Chalybæus, Wirth, and others.

FICINO, Marsilio, an illustrious philosopher of the Italian Platonic school, was born at Florence 1433. He was the son of the principal physician of Cosmo de' Medici; and to the liberality of this prince he owed the classical culture which inspired his future career. At the suggestion of Cosmo, F. undertook the translation of Plotinus, Iamblichus, Proclus, and Porphyry, besides a Latin but by no means literal version of Plato. In 1463, he was appointed by Cosmo president of a classical society or academy, founded in 1440, having for its aim the diffusion of the Platonic doctrines, which F. held to be the basis and confirmation of the Christian system. On the death of Cosmo, F. found a no less munificent patron in this prince's grandson, Lorenzo de' Medici; and having, at the mature age of 40, decided on entering the church, he was endowed by Lorenzo with the rectorship of two churches in Florence, and a canonry in the cathedral. His theological doctrine, while undoubtedly sincere, presents a strange medley of incongruous views, the natural result of his attempt to fuse the philosophy of Plato with the Christian creed. He died in 1499, and was interred in the cathedral of Florence, where a monument commemorates his upright and manly qualities no less than his learning and philosophy. F.'s collected works were published at Basel (2 vols. f. 1491), and consist of translations from the Greek philosophers, and original metaphysical and theological compositions, of which we may mention the *Theologica Platonica*, *De Religione Christiana*, the Latin epistles, and a Commentary on the Epistles of St Paul.

FICTION. See Novels.

FICTION OF LAW has been defined to be 'a supposition of law that a thing is true, which is either certainly not true, or at least is as probably false as true.'—Erskine, *Inst.* iv. 2, 38. Fictions have existed in all legal systems. They must be regarded as a species of legal fraud, which has been tolerated as enabling individuals who, by the strict letter of the law, would have been excluded from obtaining redress of evils, to procure that remedy by a pious fraud. There are two general maxims which regulate the application of fictions—viz., that no fiction shall be allowed to operate a wrong, and that no fiction shall be admitted which in the nature of things is impossible. The Roman form of judicial procedure abounded with fictions, by which alone, in many cases, a party aggrieved could enforce his right. Thus, an heir, unjustly disinherited, by the *querela inofficiosi testamenti*, feigned that his father had been mad. A stranger in Rome, who had been robbed, could not obtain restitution without the *fictio civitatis*, whereby he feigned himself a citizen. Many of the fictions existing in Rome have found a counterpart in modern systems; thus, the *fictio longæ manus*, whereby lands at a distance were feigned to be delivered, resembles an English feoffment at law. In like manner, the *fictio traditionis symbolicæ* of keys of a warehouse to give possession of the articles contained therein, and of a deed in confirmation of the covenants contained therein. The *fictio unitatis personarum* was the original of the Scottish fiction, that the heir is *eadem persona cum defuncto.* But in no system of laws have fictions been so liberally adopted as in that of England. It is by means of fictions alone that the original limited jurisdiction of the courts of Queen's Bench and Exchequer has been extended to ordinary suits. In the latter court, every plaintiff assumed that he was a debtor to the crown, and was debarred from discharging his obligation by the failure of the defendant to satisfy his demand; in the former, it was assumed that the defendant had been arrested for some supposed trespass which he had never in fact committed. The fictitious characters of John Doe and Richard Roe long contributed to make the action of ejectment famous. And though these fictions have disappeared before the ruthless hand of modern legislation, yet to this day, in an action at the instance of a father for the seduction of his daughter, damages can only be awarded on the assumption that she was his servant, and that he has suffered pecuniary loss by deprivation of her services. In Chancery, again, the whole doctrine of uses and trusts is based upon a fiction. Perhaps the best explanation of the introduction of fictions into legal systems is to be found in Dr Colquhoun's *Summary of the Roman Civil Law*, 2027. It involves, he says, 'less difficulty to adhere to known and admitted forms, and gradually to accommodate them to the changed state of society, than to upset all the incidents connected with them by a sudden change, which must ever tend to unsettle the law and practice of the courts. All nations have therefore found it more desirable to let the one glide into the other, than to adopt any abrupt measure which might disturb the practice and effect of former decisions.'

In the law of Scotland, fictions of law are not of frequent occurrence. For the benefit of creditors, the principle that the heir is *eadem persona cum defuncto* is admitted; and in an action of 'Reduction-improbation' of a deed, it is assumed that the document was false, whether the fact be so or not. But in general the legal system of Scotland has shewn a facility of adapting itself to the circumstances of the case, and that without producing the alarming results which presented themselves to the imagination of Dr Colquhoun.

FICUS. See Fig.

FID (from the Lat. *findere, fidi*, to divide), for splicing ropes, is a large pointed pin, with an eye at the thick end, of iron or lignum vitæ, used by sailors in separating and interlacing the strands of which the rope is composed.

A *mast-fid* is a bolt inserted through the bottom of a ship's topmast or top-gallant-mast, with each end resting on the trestle-trees sustained by the head of the lower mast or topmast. Unless the mast-fid be withdrawn, the supported mast cannot be lowered.

FIDDEMIN, one of the handsomest villages of the Fayûm, inhabited by a Mussulman and Greek population. It is surrounded by fruit trees, and is remarkable for a large olive, supposed to be the original one planted in Egypt, and yielding annually 268 pounds of olives.—Clot Bey, *Aperçu générale sur l'Egypte* (8vo, Paris, 1840), vol. i. p. 213.

FIDDLE. See Violin.

FIDEICOMMISSUM, in the Civil Law, was a conveyance of property in trust to be transferred to a third person named by the truster. *Fideicommissa*, when first introduced, were not supported by the law. The performance of them depended, therefore, on the conscience of the party intrusted, and they were consequently frequently not carried out. They were originally adopted for the purpose of conveying property either where a party, from the circumstances of the case, as inability to procure the proper number of witnesses, was prevented from executing a will; or where he desired to benefit those who, by law, were precluded from taking the property. To effect this purpose, an actual conveyance was made to a friend, coupled with a request that the property should be transferred to another. Fideicommissa having thus been introduced for a special purpose, were by degrees extended to conveyances of the whole inheritance, and finally were used for the purpose of settling estates in a particular order of succession, forming the earliest instance of Entails (q. v.). Fideicommissa first received the sanction of positive law in the reign of Augustus, by whom authority was given to the prætor to enforce the performance of these fiduciary obligations.—*Institutes*, ii. 23, s. 1. The Emperor Claudius subsequently extended this authority to the consuls and presidents of provinces. Fideicommissa were either *particular* or *universal*, the former being a bequest of a particular subject, or a part only of the inheritance; the latter comprehended the whole estate.

In *Holland*, the principles of the civil law as to fideicommissa form an important branch of the law in regard to landed estates. An heir may be required to transfer either the whole or a portion of his inheritance. The provisions of the Senatus-Consultum Trebellianum also have been adopted: but if an heir resist the intentions of the testator, and is compelled by law to execute the trust, he is not allowed to take the benefit of these provisions. The benefit also may be excluded by express direction in the will. Children who have received their legal portions, and are required to transfer to a stranger the rest of the inheritance, are entitled to retain a fourth part for themselves. Grotius, *Dutch Jurisprudence*, by Herbert, b. ii. c. 20.

FIDICULA, a small musical instrument in the shape of a lyre.

FIEF. See Feudal System.

FIELD. In Heraldry, the field is the whole surface or continent of the escutcheon or shield. It is so called, according to some, because it represents the field of battle on which the achievements or charges represented on it are supposed to have been gained. In blazoning, the tincture or metal of the field must be the first thing mentioned.

FIELD-ALLOWANCE, a daily allowance granted to officers of the British army in consideration of extra expense entailed upon them in consequence of military operations. *Ordinary* field-allowance, ranging from £1, 10s. for a general officer to 1s. for a subaltern, is applicable when troops are encamped at home or in the colonies. *Extraordinary* field allowance is sanctioned when and wherever troops are engaged in actual warfare: it ranges for the above ranks from £2, 10s. to 1s. 6d. Strict rules are laid down that no officer shall receive this allowance unless positively present with the army.

FIELD-GLASS is the lens usually interposed between the object-glass and eye-glass of a microscope, which, receiving the diverging rays from the former before they form an image, contracts the dimensions of the image, and increases its brightness, so as to render it of a proper size and degree of distinctness for being viewed by means of the eye-glass. See FIELD OF VIEW, and MICROSCOPE.

FIELD-MARSHAL, the highest rank of general officers in the British and some foreign armies. In the former, it is a special honour enjoyed by very few officers, and only conferred by selection, either on the ground of distinguished service or of royal birth. When unemployed, the field marshal has no higher pay than any other general, but if commanding an army, he receives £16, 8s. 9d. a day for staff-pay, while a general has but £9, 9s. 6d. The equivalent rank in the navy is that of admiral of the fleet. Formerly, a captain general was occasionally appointed, who had rank higher even than a field-marshal.

FIELD-MOUSE, a name popularly given to certain species both of MOUSE and of VOLE. See these articles.

FIELD OFFICERS, in the Army, are such as are competent to command whole battalions, viz., majors, lieutenant-colonels, colonels, in contradistinction to those merely intrusted with company duties, as captains, lieutenants, and ensigns.

FIELD OF VIEW is the whole space within which objects can be seen through an optical instrument; more strictly, it is the space within which the image of an object may be seen by whole pencils. That part of the image which is seen by partial pencils of the light from the object speculum or lens is called the *ragged edge*, and usually a diaphragm is employed to cut it off from the view of the observer altogether.

FIELD-TRAIN, a department of the Royal Artillery, consisting of commissaries and conductors of stores, responsible for the safe custody of the ammunition, for the formation of proper depôts of shot, &c., between the front and the base of operations, and that a due proportion shall be constantly at the service of each gun during an engagement.

FIELD WORKS are intrenchments and other temporary fortifications thrown up by an army in the field, either as a protection from the onslaught of a hostile force, or to cover an attack upon some stronghold. Field-works will be more particularly described under the article FORTIFICATION (q. v.).

FIELDFARE (*Turdus pilaris*), a species of Thrush (q. v.), in size about equal to the blackbird, but with greater length of wing; the general colour gray, the feathers tipped with a brownish black elongated spot; the throat and breast reddish yellow, streaked and spotted with black; the forepart of the back and wings of a rich brown colour; the tail slightly forked and nearly black; the under parts white. The F. is a very common winter visitant of Britain, although it rarely breeds even in the northern parts of the island. It arrives from more northern regions when the winter has fully come, and departs again towards the end of spring. It is well known to youthful sportsmen, and affords much employment for their guns during the Christmas holidays, when it may generally be found in small flocks, often along with its smaller congener, the redwing, in fields, if the weather is mild, feeding on worms, snails, &c., or, in severe weather, about hedges, thickets, and woods, wherever haws and other such fruits or seeds are abundant. Its winter migrations extend southward as far at least as the islands of the Mediterranean. It is one of the summer songsters of the north of Europe and of Siberia; its song is soft and melodious, but is much less familiar to us in Britain than its call note, which is harsh. It is extremely plentiful in Norway, where its nests are very generally built in spruce firs, and, contrary to the ordinary habits of thrushes, in society; numerous nests being often to be found in the same tree, and 'two hundred nests or more being frequently seen within a very small space.' The F. is easily tamed, and sings well in captivity.

Fieldfare (*Turdus pilaris*).

FIELDING, HENRY, born April 22, 1707, was the son of General Edmund Fielding, connected with the Earls of Denbigh. He was sent to Eton, and was afterwards transferred to the university of Leyden, to prosecute legal studies. Returning to London, he began to write for the stage, and worked with so much industry that between 1727 and 1736 he produced nearly a score of comedies and farces, which were forgotten with nearly as much speed as they were produced. He married in 1736, and falling heir to a small estate, he, with his young wife, retired from London. But his was not a Fortunatus's purse, and his hand was continually in it; and in three years after his marriage, he was back in London a student at the Temple. He was called to the bar at the usual time, but gout intervening, steady practice was rendered impossible. Happily, a way of escape was at hand. Richardson published *Pamela*; the town was ringing with it; and F., whose strong, healthy, unconventional nature revolted from the moral priggishness of 'Virtue Rewarded,' resolved to write a counterpart, purporting to be the adventures of Pamela's brother, *Joseph Andrews*. This work, begun in a satirical mood, and intended merely to quiz Richardson, deepened as it proceeded, and flowered out into humorous adventure. The exquisite character of

Parson Adams took the world by surprise, and remains one of the permanent glories of English fiction. The next important work undertaken by him was *Jonathan Wild*, a master-piece of irony, which has never been sufficiently appreciated, and which doubtless suggested to Mr Thackeray the scope and conduct of *Barry Lyndon*. The rebellion of 1745 induced F. to undertake the direction of the *Jacobite Journal*, in support of the Hanoverian succession; and shortly after, as a reward for his loyalty, he was, through the influence of Lord Lyttelton, promoted to a pension, and to the place of justice of the peace of Middlesex and Westminster. While engaged in magisterial duties, he produced *Tom Jones*, his most famous fiction, which the world has never ceased to read, nor critics to admire. His next work was *Amelia*—less striking and masterly than its predecessor, but quieter in style, and enriched with scenes of domestic tenderness. Shortly after its publication, he was attacked by dropsy, jaundice, and asthma, a complication of disorders which baffled the skill of the physicians. Seeking relief, he left England for Lisbon on the 26th June 1754, and died there on the 8th October of the same year, at the early age of forty-seven.

F. was the first great English novelist, and he remains to this day one of the greatest. *Tom Jones* is a miracle of invention, character, and wit. It contains the most amusing scenes and adventures, the most sparkling delineations of life, high and low, the most abundant satire. Everywhere, the author's manliness, shrewd sense, and scorn of meanness and hypocrisy, are apparent. If defects may be hinted, it may be said that F.'s nature was more robust than delicate: that it was deficient in the sentimental and poetic side; and, as a consequence, that his ideal of woman is not high, and his descriptions of the tender passion either commonplace or extravagantly rapturous. The love-scenes between Tom and Sophia, and the episode of the 'Man of the Hill,' which is meant to be passionate and poetic, are perhaps the only portions of the great novel which readers skip. It is to be regretted that all F.'s works are disfigured by coarseness of circumstance and expression; but that was the fault of the time as much as of the man. He was coarse, as he wore ruffles, drank claret, and hated the Pretender. He set himself to paint society as he saw it, and we must forgive the coarseness for the truthfulness of the picture.

FIELDING, Copley Vandyke, an English painter in water-colours, was born about 1787, and began to exhibit in 1810. For many years he held the office of President of the Society of Painters in Water-colours, and was generally recognised as the representative of that branch of art in England. He died at Worthing, in Sussex, March 3, 1855, in his 68th year, and after a career of steady prosperity. Possessing remarkable mechanical dexterity and knowledge of effect, F. painted with what severe critics would call fatal facility. He contributed about a score of pictures annually to the exhibition of the Water-colour Society. But, to do him justice, he always exhibited a certain easy finish of treatment, which was perhaps of itself a kind of secondary talent. Although his range of subjects was but limited, yet within it he was almost unrivalled. As a painter of marine effects, and of the landscapes of down and glade, it is thought by many that he has had as yet no equal.

FIERDING COURT (Fierding Thing), a district court in use among the early Gothic nations. This court was established for the purpose of rendering speedy justice in small matters. There were four of these courts in every hundred, each presided over by a separate judge, whose jurisdiction extended to all causes where the matter in dispute did not exceed the sum of three marks. Stiernhook, *De Jure Goth.* lib. i. c. 2.

FI'ERI FA'CIAS, Writ of, an English writ for enforcing the judgment of a court of law against the goods of a debtor. It may be sued out as soon as final judgment has been signed, or, in case of a trial out of term, in fourteen days after verdict, unless, on special cause shewn, a judge order speedy execution. But a writ of fieri facias cannot be enforced after a *Capias ad satisfaciendum* (q. v.) has been issued. The sheriff, in executing this writ, may not break open doors; but having obtained peaceable entrance, he may break open inner doors, cupboards, and trunks. The officer in execution having taken possession, may leave an assistant in charge, by whom an inventory of the goods is made. He is entitled to remain on the premises a reasonable time, in order to remove the goods; but if he continue longer without permission of the owner, he is liable to an action for trespass. By 8 Anne, c. 14, if goods are removed from land or premises let on lease, the party removing them must pay the rent and taxes. A creditor may not take, in execution, manure, hay, &c., where, by the covenants of the lease, the tenant is prohibited from removing them (56 Geo. III. c. 50). Growing crops, if seized in execution, and sold, are liable for rent accruing after the date of the seizure, as long as they remain on the ground (14 and 15 Vict. c. 25). By 1 and 2 Vict. c. 110, money, bank-notes, bills of exchange, and other securities, may be taken under a writ of fieri facias. By 8 and 9 Vict. c. 127, a creditor is not entitled to take wearing-apparel and bedding or tools where the value of the whole does not exceed £5. Such fixtures as belong to the heir, and not to the executor, cannot be taken under this writ. The goods of the party only who is named in the writ may be seized; and if the officer take goods belonging to a stranger, he is liable to an action for damages. By 1 and 2 Vict. c. 110, decrees in Chancery have the effect of a judgment in a court of law. In Scotland, the corresponding process for seizing and selling a debtor's goods is a warrant to poind the movables. See POINDING.

Fieri facias de bonis ecclesiasticis is a writ directed to the bishop of the diocese, requiring him to attach the ecclesiastical goods of a clergyman within his diocese, in satisfaction of the judgment of a court of law.

FIESCHI, Count Giovanni Luigi, a member of one of the most illustrious Houses of Genoa, was born about the year 1523. In addition to the lustre of ancestral fame, his name has attained a large historical celebrity in connection with a remarkable conspiracy of which he was the chief. Andrea Doria, a famous admiral, sprung from a race
hereditarily at feud with that of F., hav
the forces of Francis I. from the state,
the republican form of government, but at
time, by his vigorous administration, effec
in check the ambition of the nobles.
organised a plot, having for its object
Doria, and his nephew Gianettino, t
F.'s special hatred, and the establis
oligarchic form of government. Inst
approval of France and Rome, and
an alliance with the Duke of Parma,
enrolled a formidable array of acc
three brothers among the foremost. C
own feudal retainers were secre
assembled from the various heredit
House; three galleys, purchased wit

of the pope, were fully equipped, and all being in readiness, the attempt was fixed for the 2d of January 1547. Doria, in spite of repeated warnings, refused to ascribe treacherous or subversive designs to F., whom he regarded as a fast friend and partisan. Complete success seemed at first to crown the conspirators; the gates of the city were forced, the fleet captured, Gianettino assassinated, Doria in flight. F. had but to appear and dictate, but he was nowhere to be found; and the strangest episode of this wild drama is the sudden disappearance of its hero. In stepping from one galley to the other in the darkness of night, F. stumbled, and falling overboard, was borne down by his ponderous armour, and miserably drowned in the harbour, or, according to some, stifled in the slime.

FIESCHI, Joseph Marco, known by his attempt on the life of King Louis Philippe, was born in Corsica in the year 1790. His early life contains nothing of note. A profligate career appears to have reduced him to great poverty about the year 1835, when he conceived the idea of assassinating the king. The immediate cause of his diabolical design was the suppression of a situation which he held, by order of the prefect of the Seine. Disguising his crime under the cloak of political enthusiasm, he leagued with himself one or two obscure persons, of pothouse politics, who hated the government of the Citizen King. These were Pierre Morey, a saddler; Pepin, a grocer; and Victor Boireau, a maker of lamps. F. sketched the plan of an infernal machine with twenty barrels, that could be simultaneously discharged; got one made, and placed it in a house of the Boulevard-du-Temple. The review of the National Guard held there, 28th July 1835, afforded F. the opportunity he desired. On the approach of the king and queen, he fired his machine. Eighteen people were killed, among whom was Marshal Mortier, who fell dead beside his sovereign. Louis Philippe, however, self escaped with a mere scratch, and was able ontinue the review. F. was immediately seized, along with his accomplices, was tried, con- aned, and executed, 16th February 1836.

FIESOLE (anciently, *Fæsulæ*), one of the most ancient Etruscan cities, is situated on the crest of a hill, at about three miles' distance from Florence, which it may be said to be the parent city. m the heights of F., the view presented by rence and the neighbouring valleys is gorgeous in the extreme. We find F. first mentioned in 225 B.C. during the great Gaulish war. Hannibal encamped here after crossing the Apennines. The city was next destroyed by Sulla in the Social War (90—89 B.C.), who afterwards despatched thither a military colony. At the invasion of Tuscany by the Goths, F. also fell under their dominion, and being by nature and art a formidable stronghold, was numerously garrisoned by the barbarians. The growth of Florence during the middle ages gradually reduced it to insignificance. It is now a place of about 2500 inhabitants. The only vestige of Etruscan structures still remaining is the cyclopean city wall, constructed of huge blocks of stone, many portions of which are wonderfully perfect. The site of the Etruscan fortress is now occupied by a convent, and interesting fragments of the foundations n brought to light. The amphitheatre and r remains belong to the Roman age. The very nt church of St Alexander, supposed to have ally served as a pagan temple, contains an . dedicated to Bacchus, the inscription of which however, illegible, owing to a fissure in the ble. Coins and other relics have been repeatedly

FIESOLE, Fra Giovanni da, one of the most eminent regenerators of Italian art, also known by the title of *Il beato Angelico*, was born at Mugello in 1387. In 1407, he entered the Dominican order, and, together with his brother, consecrated his artistic abilities exclusively to sacred aims, illustrating various works of devotion with beautiful miniature designs. These early artistic efforts are remarkable for their rich effects of colouring, gorgeous illumination, and exquisite elaboration of the most minute ornamental details. Having achieved a high reputation as fresco-painter by some noble compositions with which he endowed his own and other convents, he was commissioned by Cosmo de' Medici, with the decoration of the church of Santa Annunziata and the convent San Marco. Each cell of the convent was adorned with a fine fresco of large dimensions, and amidst other paintings, one can still distinguish F.'s 'Annunciation.' The fame of this work induced Pope Nicholas V. to summon him to Rome, and intrust him with the execution of a series of illustrations taken from the life of St Laurence, destined to embellish the private chapel of St Laurence in the Vatican. See Giangiacomo Romano, *Le Pitture della Cappella di Nicolò V.*, &c. (Rome, 1810). So rigid a disciplinarian was F., that no private or public work was ever undertaken without the formal consent of his superiors being obtained, and to them all pecuniary remuneration was transferred. The archbishopric of Florence, spontaneously offered him by the pope, was humbly declined. He died in Rome in 1454. The gallery of Florence possesses several pictures of F., still undimmed in brilliancy of colouring. One of these, the 'Birth of John the Baptist,' is a conception full of simple and winning grace. Some of the largest easel-compositions of this artist at present adorn the gallery of the Louvre; among those in the antechamber are the 'Coronation of the Virgin,' and the 'Miracles of St Dominico.' One supreme aim pervades all the creations of F.—that of arousing lofty devotional feeling through the contemplation of the beautiful in art.

FIFE, an ancient wind-instrument of military music, in which the melody is produced by blowing through a hole in a reed or tube, while the escape of air is regulated by the fingers stopping or opening a number of other holes in different parts of the pipe. It has a compass of two octaves, from D on the fourth line of the treble clef to D above in altissimo. The fife figures in the sculptured memorials of the Argonautic expedition, and from that time to this has maintained its place as a simple yet effective instrument for martial purposes. It was common with English troops till the reign of James I., but was then discontinued; to be re-introduced by the Duke of Cumberland at the siege of Maestricht in 1747. It is a universal favourite in the navy, and many a stirring air on drums and fifes has cheered the British sailor to deeds of daring.

In the infantry, there is a *fifer* to each company, and a fife-major to each battalion, the former receiving the daily pay of 1s. 1*d*., the latter, who is a non-commissioned officer, 2s.

FIFE-NESS, a promontory of Scotland, the eastmost point of Fifeshire, in lat. 56° 17′ N., and long. 2° 35′ W. On the north, in the sea, are the dangerous Carr Rocks, with an iron beacon 35 feet high, which required six years to construct. F. is in view of the Isle of May and Bell Rock lights. In the Ness, trap rocks jut through the carboniferous strata, and the rocks contain small caves.

FIFESHIRE, a maritime, almost peninsular county of the east of Scotland, between the Firth of

Forth on the south and the Firth of Tay on the north. It is 44 miles in extreme length from north-east to south-west, and 18 at its greatest breadth; area, 503 square miles; coast-line, 85 miles, mostly rocky, and having many good ports. The surface is a succession of cultivated vales and hills. The hills rise in the West Lomond, 1713 feet, and Largo Law, 1020. The chief rivers are the Tay, Forth, Eden (20 miles long), and Leven (12). F. rests on old red sandstone, with trap rocks in the north, and carboniferous strata, with trap, in the south. There are many coal and iron mines, and lime quarries. The climate is dry, healthy, and mild on the Forth; but the valleys in the north are much exposed to the full sweep of the east and north-east gales. The soil is a rich loam, or wet clay on till. The Howe of Fife, on the Eden, is mostly sandy and gravelly, and not very productive. In 1872, the total acreage under all kinds of crops, bare fallow, and grass, was 240,636; under corn crops, 90,713; under green crops, 49,187; clover, sanfoin, and grasses under rotation, 55,823. The total number of cattle reported the same year was 39,125; sheep, 64,940; pigs, 7258; horses used for agriculture, &c., 9368. F. has a greater number of proprietors, gentlemen's seats, and plantations, in proportion to its size, than any other Scotch county, and its coasts are thickly studded with towns and villages. The chief manufactures are linen, floor-cloth, and malt liquors. F. contains 61 parishes. Pop. (1871) 160,735. It returns one member to parliament. The chief towns are Cupar, the county town, Dunfermline, St Andrews, Kirkcaldy, East and West Anstruther, Burntisland, Crail, and Dysart. The ancient 'Kingdom of Fife' was the most cultivated, as well as the most warlike, of Scotch counties. It contains striking monastic, feudal, and palatial ruins at St Andrews, Dunfermline, Falkland, and Lindores; many Celtic and Roman remains. Many of the events connected with the Scottish Reformation took place in this county, especially at St Andrews.

FIFTEENTH, a stop in English organs tuned two octaves above the diapasons, the lowest C pipe of which is two feet long.

FIFTH MONARCHY MEN. Among the strange and whimsical forms of opinion which the religious and political fermentation of the 17th c. brought to the surface of society, and embodied in the shape of religious sects, were those of the Fifth Monarchy Men. The date which has been assigned to their first appearance is 1654. Notwithstanding the ridicule with which they have often been overwhelmed, there seems nothing in their tenets more objectionable than we find in those of many of the other sects of the period, and there is no reason to believe that the practices of their leaders exceeded in absurdity, or equalled in impiety, those of Robbins, Reeve, Muggleton, and other apostles of the Ranters. In common with most persons who hold the literal interpretation of prophecy, they believed in the four great monarchies of Antichrist marked out by the prophet Daniel; and quite consistently with Christian orthodoxy, they added to them a *fifth* viz., the kingdom of Christ on earth. So far, there was nothing peculiar in their views. But their error was twofold. 1*st*. They believed in the immediate, or at least in the proximate, advent of Christ (a tenet which was common to them with the early church); and 2*d*. They held that the fulfilment of God's promise to this effect must be realised by the forcible destruction of the kingdom of Antichrist. Every obstacle which opposed itself to the setting up the Messiah's throne was to be thrown down, and what these obstacles were was a question for the solution of which the only criterion which pre itself was their own fanatical prejudices and l It is obvious that such doctrines in such ti have given rise to practical as well as sp disorder. The Fifth Monarchy Men became as a sect shortly after the Restoration; a fact by depriving them of exponents of their body, may have exposed them to misrepresent (Marsden's *History of the Later Puritans*, p In politics, the Fifth Monarchy Men were republ of the extremest section; and when their consp to murder the Protector, and revolutionise government, was discovered in 1657, their le Venner, Grey, Hopkins, &c., were imprisone the Gate House till after the Protector's d Amongst their arms and ammunition which seized, was found a standard exhibiting a couchant, supposed to represent the lion o tribe of Judah, with the motto, 'Who will him up?'—Niel's *Puritans*, vol. iv. p. 186. Se Carlyle's *Cromwell's Letters and Speeches*, v p. 31.

FIG (*Ficus*), a genus of trees and shrubs b ing to the natural order *Moraceæ*, and di by having the flowers—male and fema within an almost closed top-shaped fleshy recep which enlarges to form the fruit, and en numerous one-seeded carpels, imbedded in its There are more than 100 species, some of them large trees. Almost all belong to tropical an tropical countries, of the vegetation of which often form a most important feature. They a in India, in every jungle and hilly situation, t most northern Himalaya, and some of the cultivated about every village. Both *F. re* (the Peepul) and *F. Rumphii* are held in vene by the Hindus. The most notable species a Common Fig (see below); the Banyan (q. v.) Peepul (q. v.), Bo Tree or Sacred Fig of India Sycamore (q. v.); and the East Indian Caout (q. v.) Tree. The leaves of some species are those of others are lobed. Several species exhibit the character for which the bany particular has become celebrated, of sending straight down to the ground from their spr branches, and thus multiplying the apparent by which a vast canopy of branches and fo supported. The East Indian Caoutchouc or Rubber Tree is remarkable for the exposure roots, which appear in masses above ground, ing on all sides from the base like great snakes. Some figs are creeping or traili with slender stems, covering heaps of ascending trees like ivy.—Besides the C many species yield edible fruits, altho them are nearly equal to it in va them are the Peepul (*F. religiosa*), *F.* *pumila*, *F. auriculata*, *F. Rumphii*, *F.* *aspera*, *F. racemosa*, and *F. granatum*, a also the Sycamore of Egypt.—The m some species is bland and abundant, *sureana*, which has therefore been ra Cow-trees. In other species, the milky acrid. That of the Common Fig produce sensation on the tongue. That of *F.* native of the Malayan islands, is used for arrows.—LAC (q. v.) is gathered from —The leaves of *F. politoria* are so ro are used for polishing wood and ivory i juice of the fruit of *F. tinctoria* is used dye cloth: the colour is at first gre acted on by the juice of a *Cordia*, it be red. The bark supplies cordage, of w nets are made.

The COMMON FIG (*Ficus Carica*) the East, as the specific name *Carica*

; but it is now cultivated throughout the
of the south of Europe, and is even found
ised there. Its cultivation has also extended
y warm countries. In North America, it is
to be seen further north than Philadelphia;

ke small cheeses. In the Levant, Portugal,
and the Canaries, a spirit is distilled from fermented figs.

FIGARO, a dramatic character introduced on the Parisian stage in 1785 by Beaumarchais (q. v.) in his *Barbier de Séville* and his *Mariage de Figaro*. These plays, in which F., who coolly outwits every one, is first a barber and then a valet de-chambre, secured for their author a brilliant reputation not only in France, but also in Germany, where many translations and adaptations of the pieces appeared. Mozart, Paesiello, and Rossini also made them the basis of classic operas. Since their publication, the character of F. has stood as a type of cunning, intrigue, and dexterity. After the restoration of the Bourbons, a literary periodical, distinguished for its satirical talent, assumed the name.

FIGEAC, a town of France, in the department of Lot, is situated in a valley surrounded by finely wooded hills on the right bank of the Sellé, 32 miles east-north-east of Cahors. It is irregular, its streets are narrow, and badly planned, and its houses in general not well built, but the antiquity and quaintness of many of its buildings give it a picturesque and interesting appearance. It has two beautiful Gothic churches, one of them, that of St Sauveur, has a choir of the 11th, a general superstructure of the 15th, and a modern front of the 19th century. F. owes its origin to a Benedictine monastery, founded by Pepin in 755 A.D. It has some cotton manufactures, and a trade in wine and cattle. Pop. (1872) 5394.

FIGHTING FISH (*Macropodus pugnax* or *Ctenops pugnax*), a small fresh-water fish, of the family *Anabasidæ* (q. v.), a native of the south-east of Asia, and particularly of Siam, where it is very commonly kept as goldfishes are in Britain, but on account of its pugnacity. Two of these creatures when brought together, often rush immediately to combat, or it is even enough to introduce a looking-glass into the water, and the fish hastens to attack its own image. Fish-fights are a favourite amusement of the Siamese; the licence to exhibit them yields a considerable annual revenue; and an extraordinary amount of gambling takes place in connection with them; not merely money and property, but children and liberty being sometimes staked. The F. F. has the anal and dorsal fins prolonged into tapering points. When the fish is quiet, its colours are dull; but when it is excited, they glow with metallic splendour, and 'the projected gill-membrane, waving like a black frill around the throat, adds something of grotesqueness to the general appearance.'

FIGUERAS, a town in the north-east of Spain, is situated near the French frontier, in the province of Gerona, in a fruitful district, 20 miles north-north-east of the town of Gerona. Its streets are gloomy, but it has beautiful promenades. On a height near the town is the citadel of S. Fernando, the strongest fortress of Spain, and the key of the Pyrenees on their south side, with accommodation for 20,000 men. This fortress has been so frequently taken by the French, as to give rise to the remark, common enough among the Spaniards, that the citadel of S. Fernando, in time of peace, belongs to Spain, but in time of war to France. Pop. 7400.

FIGULINE. See POTTER'S CLAY.

FIGURANTES is the term applied in the ballet to those dancers that do not come forward alone, but dance in troops, and also serve to fill up the scene and form a background for the solo dancers.

FIGURATE NUMBERS. The nature of

figurate numbers will be understood from the following table :

	1,	2,	3,	4,	5,	6,	7,	&c.
I.	1,	3,	6,	10,	15,	21,	28,	&c.
II.	1,	4,	10,	20,	35,	56,	84,	&c.
III.	1,	5,	15,	35,	70,	126,	210,	&c.
		&c.				&c.		

The natural numbers are here taken as the basis, and the first order of figurate numbers is formed from the series by successive additions; thus, the 5th number of the first order is the sum of the first five natural numbers. The second order is then formed from the first in the same way ; and so on.

If instead of the series of natural numbers, whose difference is 1, we take series whose differences are 2, 3, 4, &c., we may form as many different sets of figurate numbers. Thus :

	1,	3,	5,	7,	9,	&c.
I.	1,	4,	9,	16,	25,	&c.
II.	1,	5,	14,	30,	55,	&c.
III.	1,	6,	20,	50,	105,	&c.
	&c.				&c.	

Or—

	1,	4,	7,	10,	13,	&c.
I.	1,	5,	12,	22,	35,	&c.
II.	1,	6,	18,	40,	75,	&c.
III.	1,	7,	25,	65,	140,	&c.
		&c.			&c.	

The name *figurate* is derived from the circumstance, that the simpler of them may be represented by arrangements of equally distant points, forming geometrical figures. The numbers belonging to the first orders receive the general name of *polygonal*, and the special names of *triangular*, *square*, *pentagonal*, &c., according as the difference of the basis is 1, 2, 3, &c. Those of the second orders are called *pyramidal* numbers, and according to the difference of the basis, are triagonally, quadragonally, or pentagonally pyramidal. The polygonal numbers may be represented by points on a surface; the pyramidal by piles of balls.

The general formula for polygonal numbers, from which any particular one may be found by substituting the proper values for n and r is,

$$\frac{(r-2)\,n^2-(r-4)n}{2}$$

where n = number of the term required, r = the denomination (3 if triagonal, 5 if pentagonal, &c.).

FIGURED BASS, in Music, is a bass part with figures placed over the notes, which indicate the harmony to be played to each note, and serves as a guide to the accompanist. Ludovico Viadana is said to have been the inventor of figured bass in the 17th century.

FIGURE-STONE. See SOAP-STONE.

FIJI, FEEJEE, or VITI ISLANDS, an archipelago of about 312 islands in the Southern Pacific Ocean, situated in lat. 15° 30′—20° 30′ S., and long. 177°—178° W. The group, which has a total area of 8034 square miles, almost equal to that of Wales, was discovered in 1646 by the Dutch navigator Tasman. The largest of the group, Viti-levu, or Big Viti, has an area of 4179 square miles ; Vanua-levu, of 2486 square miles; and all the other islands together, of 1069 square miles. The islands are of volcanic origin, and although there are no longer any active volcanoes, yet hot springs, numerous earthquakes, and other signs testify that the subterranean forces are not quite extinct. They are all coral-girt ; and to the approaching navigator appear clothed to their very summits with a dense and luxuriant vegetation. The surface is generally hilly, and the soil, owing to the abundant rain, is very productive. The windward sides of the islands
are covered with thick forests, while to the le
we see a grassy country dotted here and ther
screw-pines. The most important river i
Kailevu, in the island of Vanua-levu, navigab

of viceroy of Viti. Up till 1854 cann
universal in the islands ; but since that d
been suppressed, or at least banished to
remote districts, through the efforts of

aries. About one-third of the natives are professed Christians, and almost all have abandoned their idols. The Wesleyans, who first came in 1835, have made most converts; but the Roman Catholic priests, arriving in 1846, have also been successful.

According to the latest estimate, the native population amounts to 146,000, of whom 70,000 are in Viti Levu, 33,000 in Vanua-levu, and 43,000 in the smaller islands. Before the arrival of the missionaries there were only 4 or 5 white residents in Viti; in 1856 there were not more than 50; but since the appointment of a British consul in 1859, their number has increased rapidly, and there are now 2140, inclusive of the half-breeds. Most of them are British subjects from other colonies, but there are also some Americans, Germans, and others.

The later history of Viti has been very tumultuous, and to this fact is undoubtedly owing the small extent of its commerce. In 1855, Thakaumba, f of Bau, was made responsible for a debt due n the natives to the Americans; and this alted in his election to the dignity of 'Tui Viti,' king of Viti. In 1857 he offered to cede Viti to at Britain, in consideration of the payment of debt to America, stipulating only for the reten- n of his title and authority over the natives. is offer, however, was refused by the British vernment in 1862, after sending out a deputation. 'Polynesian Company' was then started, which lertook to clear off the debt, in return for certain able privileges, but ultimately it collapsed. In he President of the United States refused the ectorate of the islands. From that date to 3, three or four constitutions were drawn up and ctioned by the government of King Thakaumba, the rule of Viti; but none of them proved suc- ssful, and the utmost mal-administration all along vailed. In 1873 a renewed offer of cession to British government was made. And now (1874) the offer will in all likelihood be accepted.

FILARIA. See GUINEA-WORM and THREAD-WORM.

FILBERT. See HAZEL.

FILE, FILING. A file is a steel tool, having surface covered with teeth or serratures, and ed for cutting down and shaping metals and r hard substances. There is little doubt that earliest stages of metal working, when bronze ements first superseded those of stone, rough es were used for the purposes to which files now applied; nevertheless, the use of files dates high antiquity. They are mentioned in the Testament in the first book of Samuel, xiii. 21, also in the *Odyssey*.

Files are made of almost every conceivable shape, to suit the very varied purposes to which they are applied: flat, square, round or *rat-tail*, triangular, half-round, feather-edged, &c., besides being variously bent, in order to get at intricate work. Nearly all these files are made thicker in the middle, or 'bellied,' the object of which will be explained er FILING.

Files require to be made of the very best steel, h is first forged into the required shape, and is called a 'blank.' The blanks are then finished re accurately to the required form by grinding, ing, or filing.

The blanks thus prepared and well softened (see TEMPERING) are next handed to the cutter, who sits astride on a low bench or stool, and has before him a stone anvil, with a flat piece of pewter laid on it. The blank is held upon the anvil, with tang towards the cutter, by means of a long loop of leather strap, into which the cutter places his foot. He then cuts the teeth by striking with a hammer a short stout chisel, held obliquely at an angle of about 12° or 14° from the perpendicular. The object of this will be easily understood; for, if the chisel were perpendicular, a furrow like the letter V would be indented, and an equal burr struck up on each side; but, instead of this, a cutting tooth like that of a saw, but with less obliquity, is required; this is effected by the obliquity of the chisel, and a burr is thrown up on one side only—viz., towards the tang.

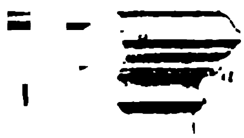
The astonishing regularity observable in the distance between the teeth is secured in this way: The cutting is commenced at the point of the file; the chisel is then drawn backwards, laid upon the blank, and slid forwards till it reaches the burr raised by the last cut; the blow is now struck, and another tooth and burr produced, which serves as a guide for the next cut; and so on. The distance between the teeth thus depends on the force of the blow and the obliquity of the cut; for the heavier the blow, the greater the ridge or burr, and the obliquity determines the distance of the cut from the burr; the skill of the workman consists, therefore, in the precise regulation of the blows.

Most files are double-cut—that is, they have two series of *courses* of chisel cuts, which are oppositely inclined at an angle of about 55° to the central line of the file. The second course is made in the same manner as the first, but with lighter blows, and is usually somewhat finer than the first. This angular crossing converts the ridges into pointed teeth. Files used for soft metals which are liable to clog the teeth, are single-cut—that is, they have but one course of cuts. Taper files have the teeth finer towards the point. Rasps for wood are cut with pointed chisels; each tooth being an angular pit with a strong burr, instead of a long furrow. The newly cut teeth in the soft steel are preserved from injury by being laid upon the softer pewter block before referred to. The rapidity with which the blows are struck varies with the fineness of the file; 60 or 80 cuts are commonly made per minute.

Files have to be very carefully hardened and tempered. If heated too strongly, or made too hard, the steel is so brittle that the teeth tear off; if too soft, they wear down rapidly, and the file soon becomes useless. Great care is also required in keeping them straight, as the sudden cooling necessary for hardening is very apt to warp the steel.

At first sight, it would appear, from the simplicity and continual repetition of the movements required in file-cutting, and the precision and regularity of the work, that it is an operation specially adapted for machinery. Many attempts have been made to cut files by machinery, but with only partial success; the chief difficulty arises from the necessity of modifying the force of the blow to suit the hardness of the steel. It is practically impossible to supply a large number of blanks all of exactly the same hardness; and if the machine be adjusted to suit the hardness of one blank, it may strike too heavy or too light a blow for the next; whereas the workman *feels* at once the hardness of the steel he is working upon, and adjusts his blows accordingly.

FILING.—To the uninitiated, this may seem a simple operation of rubbing one piece of metal upon another, and requiring only muscular strength and no skill. This is far from being the case, for a skilful workman will, in a given time, with a given amount of muscular work, cut away a far greater quantity of metal with a file than one who is unskilful, for he makes every tooth *cut into* the work, instead of *rubbing over* it. To do this, he must adapt the pressure and velocity of motion of the file to the coarseness of its teeth, and the hardness, supernatural powers of healing. A seat in the rock of Dunfillan still keeps the name of 'St Fillan's Chair;' and two cavities beside it are said to have been hollowed by St F.'s knees in prayer. His Irish church is at Ballyheyland (anciently called Killhelan or Kill Faelain), in the barony of Cullenagh, in Queen's County. (2) ST FILLAN, the abbot, the son of St Kentigerna of Inchcailloch, in Loch Lomond, lived in the 8th c., and had his yearly festival on the 7th or 9th of January. His church in Ireland was at Cluain Maoscna, in Fartullach, in the county of Westmeath. His chief church in Scotland was in Perthshire, in the upper part of Glendochart, which takes from him the name of Strathfillan. Here, a well-endowed priory, dedicated in his honour, was repaired or rebuilt in the beginning of the 14th century. King Robert Bruce made a grant of money to the work, in gratitude, probably, for the miraculous encouragement which he was said to have received on the eve of Bannockburn from a relic of the saint—one of his arm-bones enclosed in a silver case. Another relic of St F.—the silver head of his crosier, or pastoral staff—has been preserved to our time. It is called the 'Coygerach' or 'Quigrich,' and appears in record arly as the year 1428, when it was in the here- keeping of a family named Jore or Dewar, ere believed to have been its keepers from of King Robert Bruce. They had half a eal yearly from every parishioner of Glen- who held a merk land, and smaller quan- aller tenants; and they were bound, llow the stolen cattle of the parish- erever their traces could be found within of Scotland. The Quigrich, besides its the detection of theft, was venerated also its miraculous powers of healing. In 1487, the of keeping it was confirmed to Malice Doire or by King James III. in a charter, which was d for registration among the public records tland so lately as the year 1734. Sixty years the Quigrich still commanded reverence; but aling virtues were now only tried on cattle, once opulent keepers had fallen to the rank m-labourers. It was publicly exhibited in rgh in the year 1818, before being carried ada, where it now is, in the hands of a dant of its old custodiers, a farmer named ander Dewar. He puts such a value on the that he has hitherto refused to part with it than £400 sterling, or 1000 acres of Canadian It has been recently figured and described by iel Wilson in a paper in the *Canadian Jour-* xxiv., reprinted in a pamphlet, with the *The Quigrich, or Crosier of St Fillan* (Toronto, ; and in the *Proceedings of the Society of quaries of Scotland*, vol. iii. part ii. p. 233, plate (Edin. 1861). A linn in the river Fillan chart, in Strathfillan, was long believed to wonderful cures on insane persons, who were rsed in the stream at sunset, and left bound d and foot till sunrise in the ruins of the neighbouring church of St Fillan. A hand-bell, which bore the name of St Fillan, was also believed to work miracles.



Fillets.

FILLET, in Architecture, a small space or band like a narrow ribbon used along with mouldings. *a*, *a*, *a* (see fig.) are examples of fillets, both in classic and Gothic architecture.

FILLET, in Heraldry, is an ordinary which, according to Guillim, contains the fourth part of the chief.

FILLIBUSTERS, another name for the piratical adventurers whose origin and history are treated of under BUCANEERS (q. v.). Recently, it has become familiar to English ears as the designation of certain lawless adventurers belonging to the United States, who have attempted violently to possess themselves of various countries in North America. The plea urged by these persons has generally been, that such countries were a prey to anarchy and oppression, and could only attain to prosperity by annexation to the United States, and the introduction of 'democratic' institutions—amongst which, strange to say, slavery stands prominent. The most notorious of these fillibusters was the late William Walker, whose expedition against Nicaragua in 1855 was so far successful that he kept his ground in that country for nearly two years. At last, he was driven out by a combination of the various states of Central America. He was subsequently captured and shot, September 12, 1860, at Truxillo, in Central America, in the course of another piratical expedition.

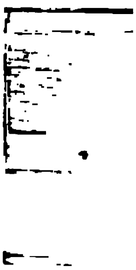
FILLMORE, MILLARD, an American statesman, ex-president of the United States, was born on 7th January 1800, at Summer Hill, in the state of New York. Born of English parents, in rather straitened circumstances, all the education he received was the very imperfect instruction furnished by the village school. At the age of fifteen he was sent to the county of Livingston, there to learn the drapery trade, and soon afterwards was bound apprentice to a wool-carder in his native village. During the four years he laboured at this occupation, he used every means at his disposal to cultivate his mind, devoting his evenings to reading and study. In his nineteenth year he made the acquaintance of a lawyer named Wood, who discovering in the young man talents worthy of a loftier sphere, took an interest in him, and offered him a situation in his office, at the same time supplying him with funds for the prosecution of his studies for the legal profession. The attention bestowed upon him by his benefactor was not thrown away. He entered with ardour upon the course thus marked out for him, and in order that he might not be too great a burden upon his friend, devoted a part of his time to conducting a school. He removed to Buffalo in 1821 in order to complete his studies, and in 1823 was admitted a member of the bar. A brilliant career was thus opened up for him, and he delayed not to pursue it. He gradually acquired both means and reputation. In 1829, he began his political career, being in that year chosen as a representative of the county of Erie in the legislature of New York, where he entered the ranks of the Whig party, at that time in opposition. Here his probity and modesty soon gained him universal esteem. He was mainly instrumental in procuring the abolition of imprisonment for debt in the state of New York. In 1832, F. was elected a member of Congress, and such were the statesman-like qualities displayed by him, that he was several times re-elected; but in 1844 he resumed his profession of advocate. In 1847, however, he again returned to public life, being elected by a large majority to the post of comptroller of New York; and in the following year he was made vice-president of the United States. The unexpected death of General Taylor in July 1850, leaving the office of president vacant, F. was raised to that high office, which he held till 1853. His presidency was marked by the passing of some very salutary measures, notwithstanding that his party were in the minority. He promoted as far as he could the progress of exploration and discovery, at home and abroad. In 1855, F. visited Europe, and on his return in 1856, he was again nominated for the presidency, but was not returned. F. took no active part in the civil war; though nominally he sided with the Union. After the expiry of his term of office, he retired to Buffalo, where he has since resided.

FILTER, FILTRATION. When solid matter is suspended in a liquid in which it is insoluble, it may be separated by various means. Under the article FINING, various methods of causing such suspended matter to collect together and sink to the bottom or float on the surface, and thereby clearing the liquid, are described. The process of filtration consists in passing the liquid through some porous substance, the interstices of which are too small to admit of the passage of the solid particles, the principle of the action being the same as that of a sieve; but as the particles of fluids are immeasurably small, the pores must be extremely minute.

One of the simplest forms of filter is that commonly used in chemical laboratories for separating precipitates, &c. A square or circular piece of blotting-paper is folded in four, the corner where the four folds meet is placed downwards in a funnel, and one side is partly opened, so that the paper forms a lining to the funnel. The liquid passes through the pores of the paper, and the solid matter rests upon it. The chief advantages of this filter are its simplicity, and the ease with which the solid matter may be removed and examined.

A simple water-filter for domestic purposes is sometimes made by stuffing a piece of sponge in the bottom of a funnel or the hole of a flower-pot, and then placing above this a layer of pebbles, then a layer of coarse sand, and above this a layer of pounded charcoal three or four inches in depth. Another layer of pebbles should be placed above the charcoal, to prevent it from being stirred up when the water is poured in. It is obvious that such a filter will require occasional cleaning, as the suspended impurities are left behind on the charcoal, &c. This is best done by renewing the charcoal, &c., and taking out the sponge and washing it. By a small addition to this, a cottage-filter may be made, which, for practical use, is quite equal to the most expensive filters of corresponding size. It consists of two flower-pots, one above the other; the lower one is fitted with the sponge and filtering layers above described, and the upper one with a sponge only. The upper pot should be the largest, and if the lower one is strong, the upper one may stand in it, or a piece of wood with a hole to receive the upper pot may rest upon the rim of the lower one. The two pots thus arranged are placed upon a three-legged stool with a hole in it, through which the projecting part of the lower sponge passes, and the water drops into a jug placed below. The upper pot serves as a reservoir, and its sponge stops the coarser impurities, and thus the filtering layers of the lower one may be used for two or three years without being renewed, if the upper sponge be occasionally cleaned. Care must be taken to wedge the upper sponge tightly enough, to prevent the water passing from the upper pot more rapidly than it can filter through the lower one.

A great variety of filters are made on a similar principle to the above, but constructed of ornamental earthenware or porcelain vessels of suitable shape. It would occupy too much space to enter upon the merits of the filters of different makers, especially as there is really very little difference between them in point of efficiency, and nearly all the domestic filters that are offered for well adapted for their required purpose. chasing a filter, the buyer must not be with merely seeing that the water whi passed through it is rendered perfectly tra —this is so easily done by a new and clean but he should see that the filter is so constr to admit of being readily cleansed, for the matter must lodge somewhere, and must b how removed. When large quantities of wa to be filtered, this becomes a serious difficu many ingenious modes of overcoming it ha devised. In most of these, water is made t through the filtering medium, in order t impurities collected on it may fall back i impure water. Leloge's ascending filter of four compartments, one above the oth upper part, containing the impure water, in capacity to the other three. This comm by a tube with the lower one, which is height. The top of this is formed by a porous filtering-stone, through which al water can pass into the third compartment, which is filled with charcoal, and covered with another plate of porous stone. The fourth compartment, immediately above the third, receives the filtered water, which has been forced through the lower stone, the charcoal, and the upper stone. A tap is affixed to this, to draw off the filtered water, and a plug to the second or lower compartment, to remove the sediment.



Leloge's

1, 2, 3, 4, the four ments: *ab*, the fi stone of third or compartment; exit filtering sto *e*, the plug to for cleaning ou compartment; *f*, sponge at communicating t

In the diagram shewing this filter in section, the figures 1, 2, 3, and 4 indicate the corresponding compartments. At *f*, the top of the tube by which the first and second compartments communicate, a sponge may be placed to stop some of the impurities.

Since 1831, when this filter was con number of ascending filters have been many of them being merely trifling modific this. Bird's Siphon Filter is a cylindrical vessel containing the filtering media, and attached a long coil of flexible pewter used, the cylinder is immersed in the cistern, and the pipe uncoiled and b edge of the cistern, and brought down co below the level of the water. It is then applying the mouth to the lower end, it till the water begins to flow, after tinues to do so, and keeps up a large water. This, of course, is an ascend the upward pressure is proportionat ence between the height of the water and that of the lower end of the SIPHON. Sterling's filtering tanks are al divided into compartments, the water first, then passing through a coarse second, and from there through a finer main receptacle, where the filtered wa and drawn off for use.

A common water-butt or cistern filter the water it receives by the Divide the cistern or butt into two an upper and a lower, by means of partition or false bottom; then take a wood barrel, and perforate it closely with holes; be into it, reaching to about the middle of side, and projecting outside a little distance; box or barrel with powdered charcoal, tightly ed, and cover it with a bag of felt; then fit rojecting part of the tube into the middle of the bottom. It is evident that water can only from the upper to the lower compartment by through the felt, the charcoal, and the tube, as, if the upper part receives the supply, and rater for use is drawn from the lower part, hole will be filtered. It is easily cleaned by ring the felt and washing it.

rious means of compressing carbon into solid masses have been patented, and filters are in which the water passes through blocks of ompressed carbon. Most of these are well ed for the purpose, but their asserted supe- y over filters composed of layers of sand and al is doubtful. A very elegant and con- st portable filter for soldiers, travellers, and who may require to drink from turbid ponds rivers, was constructed of Ransome's filtering and is also made of the compressed carbon. cylinder of the stone or carbon is connected sible India-rubber tube in such a manner cylinder may be immersed in a river, the plied to a mouth-piece at the other end of and the water drawn through the filtering

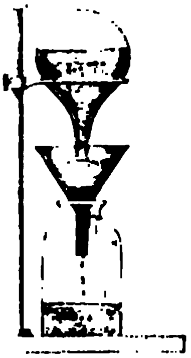
tion of water on a large scale will be under WATER-SUPPLY.

interesting experiments were made by tt, to ascertain whether soluble matter, non salt, is in any degree removed from ltration. Theoretically, it has been t this is impossible, since the filter only ically in stopping suspended particles; of Mr Witt's experiments shew that to fifteen per cent. of the soluble salts parated by sand-filters such as above bed. This is a curious and interesting subject, y of further investigation. Another most matter, on which a series of accurate nts is required, is to ascertain to what le organic matter may be decomposed especially by charcoal filters, and to ow long charcoal and other porous s its property of acting on organic watery solution. The power of dry char- decomposing organic matter in a gaseous well established (see below), and it is nown that fresh charcoal acts powerfully ic matter in solutions, but the extent to ower is retained in the charcoal of a ous action has not been satisfactorily his is of the highest importance, as happens that water of brilliant trans- d most pleasant to drink, on account of acid it contains, is charged with such poisonous organic matter as to render daily beverage very dangerous. Char- d from burning bones is still more han charcoal from wood. A filter of oal will render London porter colourless. ay have similar properties. Professor that putrid urine and sewer-water, d through clay, dropped from the filter nd inoffensive.

liquid contains mucilaginous or other ving viscous properties, there is consider- lty in filtering it, as the pores of the ecome filled up and made water-tight. ilters are therefore required for syrups, Such liquids as ale, beer, &c., would be difficult to filter, and therefore they are clarified by the processes described under FINING. Oil is usually passed through long bags made of twilled cotton cloth (Canton flannel). These are commonly 4 to 8 feet long, and 12 to 15 inches in diameter, and are enclosed in coarse canvas bags, 8 or 10 inches in diameter, and thus the inner filtering-bag is corrugated or creased, and a large surface in proportion to its size is thus presented. Syrups are filtered on a small scale by confectioners, &c., by passing them through conical flannel bags, and on a large scale in the *creased bag-filter* just described. Thick syrups have to be diluted or clarified with white of egg, to collect the sediment into masses, and then they may be filtered through a coarse cloth strainer. Vegetable juices generally require to be treated in this manner.

The simple laboratory filter has to be modified when strong acid or alkaline solutions, or substances which are decomposed by organic matter, require filtration. Pure silicious sand, a plug of asbestos, pounded glass, or clean charcoal, are used for this purpose. Böttger recommends gun-cotton as a filter for such purposes. He has used it for concentrated nitric acid, fuming sulphuric acid, chromic acid, permanganate of potash, and concentrated solutions of potash and aqua regia. He says that properly prepared gun-cotton is only attacked at ordinary temperatures by acetic ether.

Filtering paper for laboratory purposes requires to be freed from inorganic impurities that are soluble in acids, &c.; this is effected by washing the paper with hydrochloric acid, or, when thick, with nitric and hydrochloric acid, and removing the acid by washing thoroughly with distilled water.



When a considerable quantity of liquid has to pass through a filter, it is sometimes desirable that it should be made to feed itself. In the laboratory, this is done by inverting a flask filled with the liquid over the filtering funnel, the mouth of the flask just touching the surface of the liquid when at the desired height in the funnel. As soon as it sinks below this, air enters the flask, and some liquid falls into the funnel. On a large scale, self-acting filters are fed by the common contrivance of a ball-cock and supply-pipe.

Air Filters. The extraordinary powers of charcoal in disinfecting the gaseous products evolved from decomposing animal and vegetable matter, have been made available by Dr Stenhouse in constructing an apparatus for purifying air that is made to pass through it. A suitable cage, containing charcoal in small fragments, is fitted to the opening from which the deleterious gases issue, and is found to render them perfectly inodorous, and probably innocuous. The first application of this was made in 1854, when a charcoal air-filter was fitted up in the justice-room of the Mansion House, London, the window of which opens above a large urinal, the smell of which was very offensive in the room. The filter at once destroyed the nuisance, and the charcoal has been found to last many years without the need of renewal. 103 of such filters have been applied to the outlets of the sewers of one district of the city of London, and no bad smell is observable where they are placed, and no obstruction offered to the ventilation of the sewers. They have been applied with like results in two or three county towns. The subject is fully treated by Dr

Stenhouse in a letter to the lord mayor, published by Churchill (London). Charcoal respirators are small air-filters of the same kind applied to the mouth. See RESPIRATOR.

FI'MBRIATED (Lat. *fimbria*, a border or hem), is said, in Heraldry, of an ordinary having a narrow border or edging of another tincture.

FINAL JUDGMENT. The meaning of this term in the law of Scotland having led to some dispute, an Act of Sederunt (q. v.) was passed on the 11th July 1828, declaring it to be applicable to a case in which 'the whole merits of the cause have been disposed of, although no decision has been given as to expenses, or, if expenses have been found due, although they have not been modified or decerned for.' The importance of the definition arises from the fact, that only final judgments can be carried by advocation from the inferior to the superior courts. 'The whole merits of the cause' has been held to mean, not only the merits of the action to which the advocator is a party, but also those of any other conjoined with it. If the parties in the conjoined action will not proceed to have it determined, the advocator ought to apply to the inferior judge, stating his intention to advocate, and praying him to call on the parties to proceed with the conjoined process; and, failing their doing so, to disjoin the causes, which disjunction will render an advocation competent. Shand's *Practice*, i. p. 454. In Advocations (q. v.) and Suspensions (q. v.), if the record be closed, and the proof concluded in the inferior court, the case may be taken at once to the Inner House without a judgment of the Lord Ordinary, 13 and 14 Vict. c. 36. In order to warrant an appeal to the circuit court in a civil cause (where otherwise competent) not only the merits must have been disposed of, but the expenses modified and decerned for.

FINA'LE, the name given to that part of a musical composition which finishes the act of an opera; also to the last movement of an instrumental composition, as in the symphony, quartet, quintet, sonata, &c. The character of the finale, in purely instrumental works, is always lively. In the opera, it depends on the subject, while in some operas the finale consists of an aria alone, as in Mozart's *Figaro*, instead of the usual full concerted music for soli and chorus.

FINA'NCE, a French word incorporated with our language, means the art of managing money matters, the person who professes this art being called a financier. Finance, in the plural, is often used for money itself, but still with a reference to the purpose to which it is to be applied, as where the finances of a country are said to have improved or fallen off—that is to say, have become abundant or scanty according to the expenditure of the country. Sometimes the word is applied to private wealth, but it is properly applicable to public funds. We use it in this country rather in a political and economic sense than officially, but in France there have been, from time to time, comptrollers-general of finance, councils of finance, bureaus of finance, &c. Many statesmen have been spoken of as great financiers, from the talent which they have shewn for adjusting national revenue and expenditure, as Colbert, Turgot, and Necker in France, and Godolphin and Peel in Britain. As a branch of statesmanship, finance is intimately connected with other branches. In questions of national policy—such as, whether a state can go to war or not—the financier is the person who is expected to count the cost, and say how the necessary funds are to be obtained. In the question, whether an unpopular or oppressive tax is to be abolished, the financier is an authority on the question, the government can do without it. Hence is a special connection between finance and which has become closer and stronger progress of political economy has shewn taxes which are the most productive, the most easily collected, are not always looking at the gain or loss of a nation long-run. Turgot said that finance was the plucking the fowl without making it cry. notion, the principle of indirect taxation ac its popularity. For instance, customs duties to fall on no one. The importer and the add them to the price of the article, ultimate purchaser only knows that the dear without experiencing the sense of felt by one who pays out money dire shape of a tax. But many indirect tax the other hand, been found to affect the wealth of communities to an ext made them very deleterious in co direct taxes. See further on matt with finance the heads CUSTOMS; D , NA CORN LAWS; EXCISE; FREE TRAD , TA REVENUE.

FINCH (Ger. *Fink*; for the origin of th see CHAFFINCH), the popular name of a gre ber of species of little birds of the order *In* and tribe *Conirostres*. Many of them hav powers of song, and are called *Hard-billed birds*, in contradistinction to the Warbler *viadæ*) or *Soft-billed Song-birds*. The nam sometimes used as equivalent to *Fringillidæ* either in its more extensive or more re cation; but the limits of its popular indeterminate, and some birds are equ finches and as linnets, or as grosbeaks. word F. often forms part of the po birds of this family, as bullfinch, ch finch, pine-finch, &c.

FINDER OF GOODS. The finder special property in goods, which is a him against all the world except the but before appropriating them to his must use every reasonable means to disc owner. It has been decided that if the had not been designedly abandoned, and the knew who the owner was, or knew that he have discovered him, he was guilty of la keeping and appropriating the articles to use. R. v. Thurborn, 1 Denison c.c. 393; Green, 7 M. and W. 623. In the latter case, a person purchased, at a public auction, a in which he afterwards discovered in drawer, a purse containing money, priated to his own use, Mr Baron down the law. 'The old rule, that "if goods, and another find them, though them *animo furandi* to his own use, it larceny," has undergone in more recent times limitations. One is, that if the finder knew the owner of the lost chattel is, or if, fr mark upon it, or the circumstances under is found, the owner could be reasonably as then the fraudulent conversion, *animo fura* stitutes a larceny.' This law, however, in most cases clear, is, in others, extrem cult in application, and judges and ju go wrong. The question for the jury is not wh they think the finder could have discovered owner, but whether he believed that he could; if not satisfied as to this, they cannot co him of larceny. It is a mistake to suppo the finder is bound to advertise, or use ordinary means to discover the owner; inde cannot claim such expenses from the real owner, if he appear.

FINDHORN, a river rising on the west side of the Monadh Liadh Mountains, in the east of Inverness-shire. It runs north-east through the counties of Inverness, Nairn, and Elgin, in the valley of Strathdearn, passes Forres, and enters the Moray Firth at the village of Findhorn by a lagoon three by one and a half miles in extent, after a course of about 90 miles. Its waters abound in salmon and trout. Its basin consists of gneiss in the upper part, and of old red sandstone in the lower. At one place, it rose nearly 50 feet in the great floods of August 1829, known as the 'Moray Floods,' and did much damage. West of the mouth of the F. are the Culbin Sands, in one part 118 feet high, and covering 9500 acres of a formerly fertile tract.

FINE OF LANDS, in England, fictitious proceedings formerly in common use in order to transfer or secure real property by a mode more efficacious than an ordinary conveyance. A fine is defined by Coke, quoting from Glanville, an amicable composition and final agreement by leave and licence of the king or his justiciaries; and such indeed it was in its original effect, and it was called a fine because it put a termination (*finis*) to all litigation between the parties, and those claiming through them, in regard to all matters touching the suit. The proceedings in a fine were shortly as follow: The party to whom the land was to be conveyed commenced a fictitious suit against the vendor. But the case was no sooner in court than the plaintiff asked leave to agree or settle with the defendant. This leave having been obtained, a covenant was entered into whereby the vendor or defendant, called the *cognizor*, recognised the right of the plaintiff, called the *cognizee*, to the lands, of which he admitted that the plaintiff was wrongfully kept from the possession. These proceedings, which at first were real, were afterwards adopted universally without having a shadow of foundation in fact. This solemn farce having been completed, a *note* of the fine, being an abstract of the covenant, the names of the parties, and the parcels of the land, was entered on the rolls of the court; and the business was concluded by what was called the *foot* of the fine, setting forth the parties, the time and place of agreement, and before whom the fine was levied. The whole was embodied in indentures commencing *hæc est finalis concordia*. It was necessary that a fine should be levied openly in the Court of Common Pleas, or before the chief-justice of that court, or before two or more commissioners appointed in the country. Fines were of four kinds, which need not be specified here. In order that a fine should have full effect, it required to be levied with *proclamations*, i. e., open proclamation of the transaction in court. A fine so levied cut off the right even of strangers who failed to assert their claim during the period allowed by law; hence an estate was said to be barred by fine and non-claim. A fine levied by a married woman had the effect of cutting off all right she might have in the lands, and was the only mode by which a married woman could convey lands; and in order to protect her from undue influence, she was privately examined as to the voluntary nature of the transaction. A fine levied by tenant in tail cut off the estate tail, but did not affect remainders; hence, though a fine was sometimes used to bar an entail, the usual method was by common Recovery (q. v.). But while a recovery was the most effectual method of barring an entail, it required the consent of the tenant in possession. Where, then, that consent could not be obtained, or where the tenant in tail was at the same time tenant in fee in remainder, a fine was a convenient mode of barring the entail. The statute *De Donis* prohibited fines as a means of barring entails, but this restriction was removed by 32 Hen. VIII. c. 36.

The old law as to fines has been abolished by the *Fines and Recoveries Act*, 3 and 4 Will. IV. c. 74. This act was passed for the purpose of abolishing the cumbrous machinery used in the transfer of land according to the ancient forms and fictions. The act abolishes all the fictions formerly in use. In regard to fines and recoveries by heirs of entail, it permits every tenant in tail of freehold land whether in possession, in remainder, or contingency, to dispose of the lands for an estate of fee-simple absolute, or any less estate, by any of the ordinary conveyances, except a will, at common law, or under the statute of Uses (q. v.). The conveyance must be registered in the Court of Chancery within six months after its execution. But where there is an estate of freehold prior to the estate tail, the act requires that the consent of the tenant of the freehold shall be necessary in order to give full effect to the conveyance. This person is called the *protector of the settlement*. Where a conveyance is made without consent of the protector, it has the effect of barring those only who would succeed under the heir by whom it is executed. This is precisely the effect which under the old law belonged to a recovery without the consent of the tenant to the *præcipe*, and of a fine levied by a tenant in tail; so that the statute, while it abolishes the fictions, sustains entails as family settlements to the limited effect which they formerly possessed. In regard to fines by married women, the act provides that a Feme Coverte (q. v.) may dispose by deed of any lands, or of money subject to be invested in the purchase of lands. It is necessary, unless specially dispensed with by the court, that her husband should concur in the conveyance, and that she should acknowledge it before a judge of one of the superior courts at Westminster, or a Master in Chancery, or two of the commissioners appointed for that purpose under the act.

FINGAL'S CAVE. See STAFFA.

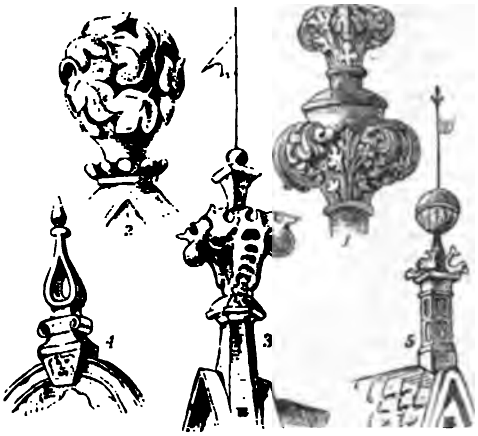
FINGER-BOARD, that part of a stringed musical instrument, as in the violin, violoncello, guitar, &c., which is made of ebony-wood, and glued on the neck of the instrument, and shaped on the top somewhat round, to suit the position in which the strings lie on the nut and the bridge. At the lower end, the finger-board projects over the sounding-board of all those instruments played with the bow, while in the guitar species the finger-board is glued down on both neck and sounding-board. The strings are stretched along the finger-board from the nut at the top to the bridge at the lower end, and are pressed down by the fingers of the left hand, to make the different notes in music; while the right hand produces the sound either by a bow or the points of the fingers.

FINGERS. See HAND.

FINGERS-AND-TOES, the popular name of a disease in turnips, called also ANBURY (q. v.).

FINIAL, an ornament, generally carved to resemble foliage, which forms the termination of pinnacles, gables, spires, and other portions of Gothic architecture. There are traces of foliated terminations, both in stone and metal, on the pediments of classic buildings (see ACROTERION), but it was not till the 12th c. that the finial proper was introduced. During the latter part of that century and the whole of the 13th c., finials of the most perfect form and of infinite v[illegible]ed as the crowning ornaments of e[illegible]n the buildings of the period (see fig. 1). The architects of the 14th c., in finials, as in other ornaments, imitated more closely the forms of natural foliage; but their finials had neither the variety of design nor the vigour of outline of those of the preceding century (see fig. 2).

In the 15th and 16th centuries, the finials became more and more meagre in form, and are frequently only four crockets set upon a bare pyramidal terminal. Some variety of effect is often obtained during this period by surmounting the finial with a gilded vane. This is common in Tudor and domestic architecture (fig. 3). Finials were carved both in stone and wood, and in the latter material with great delicacy and minuteness. In connection with metal-work, finials of metal were used, and whatever the material adopted, its natural capabilities were made a source of special beauty.



Finials:
1, from Bishop Bridport's Monument, Salisbury Cathedral; 2, York Minster; 3, Maulbroun, Germany; 4, Crew Hall, Cheshire; 5, Augsburg.

The finial is one of the most effective ornaments of Gothic architecture, and when that style was succeeded by the revival of classic, in the reign of Queen Elizabeth, our forefathers could not persuade themselves to part with the finials to their buildings. We thus find in Elizabethan architecture a great variety of finials; they are, however, almost entirely of a geometric form, and without foliage (fig. 4), and are frequently, especially when terminating wooden gables, combinations of finial and vane partly wood and partly iron (fig. 5). In the stricter classic which succeeded the Elizabethan, some traces of the favourite finial still remain in the balls, obelisks, &c., used as terminations, and also in the shields and supporters (themselves a remnant of feudalism) which form the crowning ornament of gate-piers, pedestals, &c.

FINING, the process of clearing turbid liquors, such as beer, wine, &c. The simplest mode of fining is by passing the liquor through a porous substance that retains the solids and allows the clear liquid to pass through (see FILTER); but this method is only applicable to particles mechanically suspended in a limpid liquid. When the liquid contains mucilaginous or other matter, that readily clogs the filter, some other means of fining must be used. Such is the case with all malt liquors and most wines when turbid. When in good condition, these do not usually require fining, as the suspended matter agglomerates, and sinks to the bottom shortly after the fermentation is completed. When this does not take place, some means of pr action are usually adopted. One of th to add soluble albumen, such as white o portion of the liquid, and after beating it this, to add the mixture, and stir it into the of the liquid. Upon the application of he albumen coagulates and contracts from its into a scum, enveloping and drawing toge suspended matter. The scum is then easily rem This method is adopted for syrups and other liq that may be heated without mischief.' In ma clear soups, the albumen of the meat performs function. As alcohol coagulates albumen, it be used for fining wines and cordials without application of heat. It is generally used wines. Malt liquors are usually fined by m gelatine, either isinglass or cheaper substitutes used. One pound of isinglass is soaked in thr four pints of water, or sour beer, then more liquor added as the isinglass swells, until it to about a gallon. The jelly thus formed dissolved in seven or eight gallons of the liq be fined. This solution, having the consistenc syrup, is called 'brewers' finings,' and about a to a pint and a half is added to a barrel of porter, or to a hogshead of cider or wine. action of this depends upon the combination gelatine with the astringent matter (tanni of the liquor, forming thereby an insoluble which sinks to the bottom, and carries with it the coagulating albumen, the suspended m but as the flavour of malt liquors partly de- upon the astringents they contain, the fining the flavour; the astringents also help to p the liquor, and hence their removal is in this disadvantageous. Malt liquors thus fined d 'stand well on draught.' The use of gelatin fining red wines is objectionable, as in m these the astringent flavour is an esteemed qu and therefore albumen is preferred.

Other methods of fining are adopted. Sug lead is sometimes added, and afterwards one-h weight of sulphate of potash dissolved in By this means, an insoluble sulphate of precipitated, which in subsiding carries do matters with it. This is a dangerous pro salts of lead being poisonous. If properly co the whole of the lead may be precipitate casual mistake in the quantities might c death of many people. Ox-blood is use same manner as albumen and isinglass alum, alcohol, and acids act by coagul &c., contained in the liquor. Plaster and even sand, are sometimes used to c the suspended matters. A strip of piece of dried sole-skin is often us coffee, and it acts in the manner above descr Liquors that are unusually difficult to fine called 'stubborn' by coopers and cellarmen.

FINISTÈRE, or **FINISTERRE** (Lat. *Finis* 'Land's End'), a department at the western mity of France, comprehending a part of the fo duchy of Bretagne, has an area of 2648 square and a pop. (1872) of 642,963. It is traversed east to west by two low but picturesque of hills. Its coast is very rugged and broke shores bristling with dangerous granite rocks fringed with many islands. The soil, one-t which is occupied by sandy tracts and mar moderately productive; and, owing to the of the sea, which washes the northern, we southern shores of the department, the mild and humid. Corn, hemp, and flax in considerable quantities. In the valle meadows everywhere occur. The silver mines of F. are very valuable; those of P

elgoet being about the richest in France. Its
d rivers are the Aulne, the Elorn, and the

ripen except hardy berries; and in the
north, vegetation is almost limited to
nd liverworts. F. yields some copper, iron,
d slate, but it produces scarcely any salt,
onstitutes one of the principal articles of
Reindeer, wolves, elks, beavers, and various
game abound; while the numerous lakes,
adjacent gulfs, supply the inhabitants with an abundance of salmon, herring, and other fish. The climate is rigorous, and winter, which lasts seven or eight months, is succeeded by a brief spring, which passes almost suddenly into a short but hot summer of six or seven weeks, succeeded in its turn by a rainy season, which ushers in the return of cold weather. In the north, the sun is absent during a part of December and January, and almost perpetually above the horizon during the short summer. F. is divided into eight lænes or governments - Nyland, Abo-Biorneborg, Tawastehuus, Wiborg, Kuopio, St Michel, Wasa, Uleaborg, which are included in the three dioceses of Abo, Borgo, and Kuopio, and contain in all 214 parishes. The predominant form of religion is the Lutheran, but the Greek Church has of late years been gaining ground. The courts of law are held at Abo (the ancient capital), Wasa, and Wiborg; and there is one university, founded in 1640 at Abo, but removed to the present capital, Helsingfors, in 1829. The highest administrative authority is vested in the imperial senate for F., consisting of 18 members, nominated by the emperor, and presided over by the governor-general of F. The revenue of F. in 1871 was 20,323,374 marks, or £813,000; the expenditure was 19,111,861 marks, or £764,500. The army numbers now only 679 men, but has the privilege of serving in distinct corps, without being incorporated in the general forces of the empire. The naval force also forms a distinct squadron, under its own national flag.

The early history of F. is shrouded in obscurity, and little is known of the people before the 12th c., when Eric the Saint, king of Sweden, exasperated by their piratical inroads, undertook a crusade against them, and compelled them, by force of arms, to profess Christianity. The hold which the Swedes then acquired over the country was never wholly lost till 1809, when Sweden secured peace with Russia by the cession of all F. and the island of Aland; before that time, however, the Russians had at various epochs wrested portions of the Finnish territories from the Swedes, while F. had been for centuries the perpetual cause and scene of wars between the two nations. The Swedish language had taken such deep root in F., that the efforts of the Russian government to displace it in favour of the native Finnish have hitherto met with only partial success, and in many parts of the country, the people still openly prefer their old masters. The inhabitants, who call themselves *Suomes*, and are denominated *Tchudes* by the Russians, have, however, no affinity of race with the Swedes, and may be regarded as differing from all other European nations, excepting the Lapps and the Finmarkers, to whom they are very probably allied. See FINNS and FINNISH LITERATURE.—For further information, see Gerschau, *Versuch einer Gesch. Finland* (1821); Stockfleth, *Bidrag til Kunds. om Finnerne i Norge*; Topelius, *Finland framställdt i Teckning* (1860); *Zeitschrift der Gesellschaft für Erdkunde* (vol. vi., 1871).

FINLAND, GULF OF, the eastern arm of the Baltic Sea, between 22° and 30° E. long., and between 59° and 61 N. lat. Its coasts are entirely Russian territory. It receives the waters of the great lakes Onega and Ladoga. The water of the gulf is not deep, and only very slightly salt. The topography of the Gulf of F., which has been thoroughly elucidated by Struve, forms an interesting part of the great work of the Russian survey of the Baltic.

FINLAY, George, a distinguished historian, was born in Scotland about the commencement of the present century. Circumstances induced him to take up his residence in Athens, where he has patiently and industriously devoted himself to the study of the later Greek history. The fruits of his labour and researches are contained in his *History of Greece under the Romans*, 146 B.C. *to* 717 A.D. (London, 1843; 2d ed. 1857); *History of Greece from its Conquest by the Crusaders to its Conquest by the Turks, and of the Empire of Trebizond*, 1204—1461 A.D. (London, 1851); *History of the Byzantine and Greek Empires*, 716—1453 A.D. (London, 2 vols., 1853—1854); *History of Greece under the Othoman and Venetian Dominion* (1854); and *History of the Greek Revolution* (Edin. Blackwood and Sons, 1861). F. is not regarded as a philosophical historian, in the highest sense of the term; but he has been earnest and indefatigable in his endeavours to obtain a solid and accurate conception of the times about which he has written, and has thus been enabled to throw a flood of new light on the obscurity of modern Greek history. F. also exhibits a profound knowledge of Greek art, antiquities, and topography.

FINMARK, a province of Norway, and the most northern part of the continent of Europe, lying between 68° 30′ and 71° N. lat., and 17° and 31° E. long., constitutes Norwegian Lapland (q. v.). Area about 20,000 square miles, of which three-fourths are occupied by the continent, the rest belonging to the numerous islands which skirt its north-west shores, and terminate in the North Cape. Innumerable fiords and bays indent the coast. The interior is intersected by a snow-covered range of mountains, reaching an elevation of 4000 feet; the line of perpetual snow being here less than 3000 feet above the level of the sea. Agriculture is impracticable above an elevation of 100 feet; a few berries are the only fruits that ripen; and although barley, potatoes, and a few other vegetables thrive in some parts, fish and game constitute almost the sole food of the inhabitants. In the north, where no trees are to be found, the turf of the marshes affords a good supply of fuel. The thin vegetable mould which covers the stony soil yields grass for the sheep and cows, which graze on the declivities of the rocks skirting the fiords and creeks. The principal source of wealth is the reindeer in the north, and the cod-fisheries in the south. The pop., which in 1871 numbered 22,500, consists principally of Lapps (see LAPLAND), a people of Finnish origin. Hammerfest, the capital of F. (70° 40′ N. lat.), is the most northern town of Europe.

FINNISH LITERATURE. To Elias Lönnrot of Helsingfors belongs the merit of having rescued from utter oblivion some of the numerous sagas and songs which had for ages been recited by the Finnish *Runolainen*, or singers, to the sound of the *kantela*, or harp, and thus transmitted from one generation to another. Although his researches were limited to the district of Karelia, in the government of Kupio, he obtained numerous songs and proverbs, and a complete epos, consisting of 32 parts, each of which contained from 200 to 700 verses. This singular monument of the earlier culture of the people was published by him in 1835, under the title of *Kalewala* (the ancient name of Finland), but it met with little notice till the academy of Dorpat made it the subject of discussion at their meetings in 1840. This publicity soon attracted the attention of foreign philologists, and led to its translation into Russian, Swedish, and German. The learned Finnish scholar, Carsten, the Grimms, and Brockhaus, agree in regarding the *Kalewala* as a pure epic, and characterise it as a composition possessing a thoroughly Oriental appreciation of nature, an almost unparalleled wealth of images and tropes, great flexibility of rhythm, and a copiousness of synonyms not to be met with in any other northern tongue. There is unanimity in regard to the character of the plot, while one critic believes that the incidents refe definite historical epochs, another regards them purely allegorical. But whatever discrepanc opinion there may be in this respect, the *Kal* is admitted by all who are entitled to form a judg of its merits, to be one of the most curious m ments of the kind possessed by any European pe The date of its composition must be referred period anterior to the introduction of Christi amongst the Finns in the 14th c., while there is strong internal evidence, from an identity of names and traditions of the *Kalewala* with s still current in Esthonia, that the poems very prob belong to an epoch anterior to the immigra of the Karelians into the districts which they occupy. The publication of the *Kalewala* given a powerful impetus to the study of the Fi language, which the Russian government eff sustains by encouraging the cultivation and their native tongue by the Finlanders. T classes still cling to the use of Swedish, but peasantry and small landed proprietors wel with avidity every addition to the limited st their printed literature. Finnish weekly circulate freely among them, and political qu are discussed with an enthusiasm which is met with among similar classes in Scand Russia Proper, but which affords additiona the diversity of character which disting Finn from either of the neighbouring nat which he has been successively incorporated.

The prose literature of Finland is almost ex devoted to religious and moral subjects. was translated into Finnish in 1642, but a pa the Old Testament had been translated a ce earlier. Several Finnish poets have acquire reputation of late years, but their works bre the same melancholy tone which so strongly ch terises the more ancient poems of Finland. Lö has made a collection of about 7000 proverbs (*Su kansan Sanalaskuja*, 1842), and about 2000 cha (*Suom. kans. arwoituksia*, 1851). See Erman's *A f. d. Kunde v. Russland*. *Tengström i Fosterla Alb.* (Helsingf.)

FINNS, geographically, the name of the i bitants of Finland; but in ethnology, that considerable branch of the Ugrian race, dwelling the most part in Finland, though with some re sentatives in Sweden and Norway as well. Ugrians have been classed among the nations to have a Mongolian origin. Dr Latham p them among the 'Turanian Altaic Mongolidæ'. divides them into Ugrians of the East, and U of the West. The Western Ugrians con- Lapps, Finns, Permians, and other nations o in the north and north-west of Russia, and Magyars in Hungary. The Magyars are numerous, and next after these come comprising about 2,000,000 of individuals. An other tribes of Western Ugrians do not toget comprise so many. The F., in common with other Ugrians, are of the Mongolian type. recent traveller, Mr Bayard Taylor, descri as having 'high cheek-bones, square, str full, yet firm lips, low broad foreheads, and hair, and a deeper, warmer red on than on those of the rosy Swedes. The av height is, perhaps, not quite equal to that o latter race, but in physical vigour there inferiority, and there are among them m of splendid stature, strength, and pro Other travellers bear similar testimony physical appearance of the F. proper, of pure Finnish blood; but although

FINSCALE. See RED-EYE.

FINSTERAA'RHORN, the highest peak of the Bernese Alps. See ALPS.

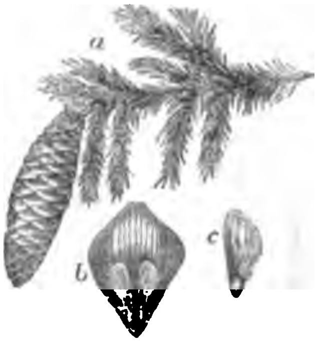
FINSTERWALDE, a small town of Prussia, in the province of Brandenburg, is situated on an affluent of the Black Elster, 40 miles north of Dresden. It has manufactures of cloth and machinery; spinning and weaving are carried on. Pop. 7370.

FIORIN. See BENT GRASS.

FIR, a name often used in a sense co-extensive with the widest sense of the word PINE (q. v.), and therefore so as to include a large portion of the CONIFERÆ (q.v.), or at least the whole of the Linnaean genus *Pinus*. But the name fir is often also used in a more restricted signification, and the trees so designated are those forming the genus *Abies* of some authors, *Abies* and *Picea* of others, which the greater number of botanists have now agreed in separating from *Pinus*. The SCOTCH FIR, however, is a true Pine (*Pinus sylvestris*), and will be described along with its congeners. See PINE.—The genus *Abies* is distinguished from *Pinus* by the flat rounded apex of the scales of its cones, and by leaves not in clusters of definite number. Some botanists include the species of LARCH (q.v.) and CEDAR (q.v.) in the genus *Abies*; but if these be separated, no species with clustered leaves remain in this genus, which then contains only the different kinds of SPRUCE FIR and of SILVER FIR, or species most nearly allied to those which ordinarily bear these names. All of them are evergreen. The Spruce Firs form the genus *Abies* of some authors, distinguished by short solitary leaves, scattered all round the branchlets, and by the scales of the (pendulous) cones being attenuated at the apex, and remaining fixed to the axis of the cone. The Silver Firs form the genus *Picea* of some, distinguished by the deciduous scales of the (erect) cones. It being supposed, however, that the Linnæan names had been given through mistake, and that the common Silver Fir is the true *Abies* of the ancients, and the Norway Spruce their *Picea*, Link has attempted, but without being followed by many, to restore these names to their ancient use, and to denominate the genera accordingly.—The NORWAY SPRUCE (*Abies excelsa* or *Pinus Abies*) is a noble tree, sometimes attaining the height of 180 feet, with long cylindrical pendulous cones, denticulate scales, and scattered, green, crowded, suddenly pointed, almost quadrangular leaves. It is the *Fichte* of the Germans, called also *Rothtanne* or *Schwarztanne*. Like the other kinds both of Spruce and Silver Fir, it exhibits the peculiar character of the *Coniferæ* more perfectly than many of the true Pines do, in its perfectly erect stem, from which proceed almost whorled horizontal branches.

Common, or Norway Spruce Fir (*Abies excelsa*): Copied from Selby's *British Forest Trees*.

It is a very beautiful pyramidal tree, and when old, its long branches droop towards the ground. It forms entire forests in the middle and north of Europe and in Asia, chiefly upon elevated ridges, although it prefers moist places. It loves districts of primitive rock. In some places, it is found even within the Arctic Circle. It is not a native of Britain, but has long been very generally planted, although too often it is merely made a nurse for other trees, and is not allowed to attain a considerable age or size. It is of rapid growth, and is believed to live to the age of 400 years. It yields



Cone of Norway Spruce Fir: *a*, branchlet and cone; *b*, scale, with seeds; *c*, a seed.

the same products as the Scotch Fir, resin, turpentine, tar, and lampblack (see these heads); but more resin than turpentine. The true Spruce Rosin flows spontaneously from the bark. The purest pieces are whitish or pale yellow, are sold under the name of Common FRANKINCENSE, and used for ointments and plasters, and when melted yield the common Burgundy Pitch (q. v.). The bark of the spruce is a good and cheap non-conductor of heat:

the cones are an excellent substitute for
bark. In Sweden and Norway, the inner

Webbiana*, the Himalayan Silver Fir, which, in its native regions, fills the upper parts of mountain valleys, and crowns summits and ridges at an elevation of upwards of 10,000 feet, a tree of great size, 35 feet in girth, and with a trunk rising 40 feet before it sends out a branch. Most of these have been introduced into Britain with good prospect of their succeeding well in our climate, and other species, as *P. Pichta*, a native of the Altai Mountains, very nearly resembling the Silver Fir, *P. Nordmanniana*, *P. Fraserii*, &c.—*P. religiosa* is a tall and elegant tree, a native of the mountains of Mexico, with slender branches, which are very much used by the Mexicans for adorning churches, and cones shorter than those of any other Silver Fir. *P. Jezoensis* is a new species recently introduced from Japan.

FIRDUSI, FIRDOWSI (Tusi, Abu'l-Kasim Mansur), the greatest epic poet of Persia, was born between 304– 328 H., or 916 - 940 A.D., at Shadab or Rizvan, near Tus in Khorassan. Whether the name Firdusi (from *firdus*, garden, paradise) was given to him because his father (Fachreddin Ahmad) was a gardener, or on account of the 'Paradise of Poetry' which he had created, is matter of controversy. All that is known of his early life is, that when a boy he was very industrious, and also that 'he loved to sit for days alone on the bank of a river.' At the age of between thirty and forty, he went to Gazneh, where Mahmud the Gaznewide, a great admirer and patron of poetry and the arts generally, then resided. Erelong, F. had an opportunity of displaying both his talent and his extraordinary knowledge of ancient Persian history and legendary lore before the sultan himself, who was so pleased with an episode (the story of Sijavush) written by him at his majesty's order, that he at once paid him a gold dirhem for each couplet, and shortly afterwards sent him a great number of fragmentary ancient chronicles and histories of Persia, that he might versify them, and thus carry out the task once attempted by Dakiki – viz., to write a poetical history of the Persian kings from the creation of the world to the end of the Sassanide dynasty (636 A. D.)—the reward to be a dirhem a line. F. spent thirty years over the work, and produced the famous *Book of Kings* (*Shah Nameh*), consisting of 60,000 double lines. Without going so far as many critics have gone, we may fairly rank it among the greatest epics of all nations: the *Iliad*, the *Mahabhárata*, the *Nibelungen*. Truth and fiction, history and fairy lore, all the most gorgeous imagery of the East and its quaintest conceits, together with the homeliest and most touching descriptions of human joy and human sorrow, of valour and of love, the poet has formed into one glowing song. Though abounding - in strict adherence to its sources—in impossibilities and anachronisms (such as Alexander the Great being a Christian, Ki-Khosroo holding the Zend Avesta in his hands—some hundred and twenty years before it was brought to light—Abraham being Zerdusht, &c.), it yet contains not a little that is of real historical value, quite apart from its being the most faithful mirror of its own times. See SHAH NAMEH. But while F. was 'weaving his poetical carpet,' his enemies had not been idle. Unable to attack his genius and his honesty, they attacked his religious opinions; and the sultan, influenced by bigotry and avarice, sent the poet, instead of 60,000 dirhems of gold, so many dirhems of silver. F. was at a public bath when the messenger arrived with the money, and on discovering that it was silver, and not gold, Mahmud had sent him, he divided the amount into three portions, and gave one to the attendant at the bath, another to the messenger, and the third to a man who brought him a glass of sherbet. He then burned several thousand verses which he had written in praise of the sultan, as sequel to the *Shah Nameh*, and composed one of the bitterest satires against him, which he handed over, well sealed, to the king's favourite slave, to give it to him when he might be seized with one of his fits of despondency, as it contained a beautiful panegyric on him. Dreading the sultan's rage, he fled precipitately, first to Tus; persecuted here, he next went to Bagdad, where Kadir Billah, the calif, received him with all honour. But the unrelenting anger of Mahmud followed him thither, and he removed to Tabaristan, which again he had to leave, to seek another place of refuge. After eleven years of restless wanderings, he was at last allowed to return to his native place, a broken, wretched old man. Mahmud is said to have repented his cruelty at last, and to have sent a caravan loaded with the costliest goods to F., to entreat his forgiveness, and induce him to become once more the star of his court. But while the king's messengers entered one gate of the city, F.'s bier was carried out to his last abode by the other, 1020 A. D. (411 H.). His only daughter—an only son of his had died long before him at the age of 37 years—refused the sultan's present, and certain buildings were erected instead, in honour of the dead poet.

The great popularity which the *Shah Nameh* has always enjoyed in the East, is to a certain amount also the cause of the uncritical state of the texts. Every transcriber shaped and moulded certain passages, or even episodes, according to his own fancy, so that not two out of the innumerable copies are quite alike. Nor are the 60,000 couplets extant in any one instance, the utmost number, including all the most palpable interpolations, never exceeding 56,600. The first complete edition of the text, with a glossary and introduction, was published by Turner Macan (Calcutta, 1829, 4 vols.). Another edition, with a French translation, was published by Mohl (Paris, 1840, &c.). Champion published some English extracts in 1788. F. also wrote an poem, *Yusuf and Zuleikha*, which has been edi Morley, and a *Divan*, or collection of poems. M European Orientalists have written on F.; others, Hammer, Wahl, Görres, Schack, Morley, Ouseley, Atkinson, Nasarianz, &c.

FIRE. For the superstitions connected fire, see BELTEIN, NEED-FIRE, and SUN AND WORSHIP.

FIRE, in Armorial Bearings, is used to de those who, being ambitious of honour, perform actions with an ardent courage, their the always aspiring as the fire tends upwards. A of fire is more frequently used as a charge France and Germany than in this country; but have fire-balls or bombs, fire-beacons, fire fire-buckets, &c., in abundance.

FIRE, ORDEAL BY. See ORDEAL.

FIRE, ST ANTHONY'S. See ERYSIPELAS.

FIRE AND SWORD. By the law of Sc though decree may be given in a civil a an absent defender, no criminal sent pronounced unless the accused be present. resist a criminal citation, is to rebel against of the land, and in former times might be treated treason. In this view, letters of *fire and sword* occasionally issued by the privy council (Stair, 89). These letters were directed to the sheriff of county, authorising him to call in the assist of the country, and to proceed to the extre which the terrible words fire and sword ind should such proceedings be necessary for appre ing the accused party. Lord Stair describes remedy as the 'last legal execution, warra manner of force of arms that is competent The same course might be resorted to decree of a court was resisted; and with which letters of fire and sword frequently issued than any other, was to enab sheriff to dislodge refractory tenants who possession contrary to the order of the judge diligence of the law. By the modern pr judge may, of course, always call in the military to apprehend an accused party, or to a decree where the ordinary means have unavailing.

FIRE ANNI'HILATOR. An apparatus this name was patented by Mr Phillips in attracted a good deal of public attention, expected at the time that it would supers ordinary Fire Engine (q. v.). The object invention was to extinguish fires by pour the midst of the conflagration of acid, sulphurous acid, and other support combustion. A bottle acid was placed immediately ov chlorate of potash and sugar, which rounded by a mixture of charcoal, n On breaking the bottle, the sulp upon the chlorate of potash and s well known to chemists, produces intense combustion of the sugar; the fires the surrounding mixture, and dense the above-mentioned gases are evolved. I however, to be practically of little value in fires, where the air has free access.

FIREARMS may be defined as whatever form—used in the propulsion of or bullets, to a greater or less distance, by of gunpowder exploded within them. played so great a part in the world's their invention, development, and scienc careful analysis. At a more advanced obvious division of the subject into mortars, and small-arms presents itself; but in the infancy of the invention, and amid the obscurity enshrouding it, we can only seek to inquire into the origin of firearms generally.

The invention of gunpowder bears so directly upon the gradual introduction of firearms, that it will be well to consider the two discoveries concurrently. The widely prevalent notion that gunpowder was the *invention* of Friar Bacon, and that cannon were first used by Edward III. of England, must be at once discarded. It is certain that gunpowder differed in no conspicuous degree from the *Greek fire* of the Byzantine emperors, nor from the *terrestrial thunder* of China and India, where it had been known for many centuries before the chivalry of Europe began to fall beneath its levelling power.

'Nitre,' says Sir George Staunton, 'is the natural and daily produce of China and India; and there, accordingly, the knowledge of gunpowder seems to be coeval with that of the most distant historic events.' The earlier Arab historians call saltpetre '(nese snow' and 'Chinese salt;' and the most ent records of China itself shew that, when y were written, fireworks were well known, eral hundred years before the Christian era. these and other circumstances, it is indu- le that gunpowder was used by the Chinese explosive compound in pre-historic times; n they first discovered or applied its power as a pellant, is less easily determined. There is an ount of a bamboo tube being used, from which 'impetuous dart' was hurled a distance of 100 this was at a very early period, but it is diffi- o say precisely when. It is recorded, however, in 618 B.C., during the Tang off dynasty, a n was employed, bearing the inscription: 'I death to the traitor, and extermination to rebel.' This must almost necessarily have been tal. We have also curious evidence in regard armament of the Great Wall; for Captain , who accompanied Lord Macartney's mission, d that 'the soles of the embrasures were d with small holes, similar to those used in pe for the reception of the swivels of wall- s. The holes appear to be part of the original truction of the wall, and it seems difficult to to them any other purpose than that of ance to the recoil of firearms.' If this surmise correct, the use of jingalls would be carried back e centuries at least before the Christian era. mortars, throwing missiles of 12 lb. to a ance of 300 paces, are particularly mentioned having been employed in 757 A.D. by Thang's y; and in 1232 A.D., it is incontestable that Chinese besieged in Caifong-fou used cannon inst their Mongol enemies. Thus, the Chinese t be allowed to have established their claim an early practical knowledge of gunpowder and effects.

t seems likely, however, that the principles of arms reached Europe from India rather than na, and that country has equal, if not superior, me to the first acquaintance with the art. The ient Sanscrit writings appear to point very inly to the operation of some primitive sort of n, when, in recording the wars of the Egyp- Hercules in India, it is stated that the sages ained unconcerned spectators of the attack on ir stronghold, till an assault was attempted, when y repulsed it with whirlwinds and thunders, ing destruction on the invaders; and a Greek orian of Alexander's campaign testifies that the ldis had the means of discharging flames and iles on their enemies from a distance.

These Indian philosophers seem, from the writings of Ctesias and Ælian, to have also possessed an unquenchable fire similar to that employed later by the Greeks. Passing from these very early times, in which there is reason to believe that some sort of great gun was employed, we come to the comparatively recent date, 1200 A.D., when their use is established beyond a doubt, for Chasél, the Hindu bard, writes (in stanza 257) that the culivers and cannons made a loud report when they were fired off, and that the noise of the ball was heard at the distance of about ten coss, which is more than three-quarters of a mile. In 1258, the vizir of the king of Delhi went forth to meet the ambassador of Hulaku, the grandson of Genghis Khan, with 3000 carriages of fireworks (in the sense of weapons, probably a sort of rude muskets). In 1368, 300 gun-carriages were captured by Muhammed Shah Bahmani. The use of cannon had so far advanced in India by 1482, that they were even used for naval purposes; shells having been employed two years earlier by the sovereign of Guzerat. In 1500, the Portuguese had matchlockmen to contend with, as well as heavy ordnance. Pigafetta, in 1511, found the town of Borneo defended by 62 pieces of cannon mounted on the walls. So much for the antiquity, and apparently common use of firearms in China and India, at times long antecedent to any knowledge of them in Europe, and during the period at which they were scarcely developed in an effectual degree. Most of the pieces discovered in India, and supposed to be of early manufacture, are composed of parallel iron bars welded together, and very often they had a movable breech-piece.

The knowledge of gunpowder and firearms may be presumed to have extended in a westerly direction through the Arabs, whom we find using them possibly in 711 A.D., under the name of *manjaniks*, and certainly very early in the 14th century. The Byzantine emperor, Leo, introduced 'fire-tubes' between 890 and 911, for use in connection with Greek fire; and there can be little doubt that these were a species of cannon, probably of small bore. In Spain, both Moors and Christians used artillery as early as the 12th century.

Friar Bacon was conspicuous among his contemporaries for his general learning, and we have no evidence to shew whether he discovered the ingredients of gunpowder independently of foreign aid, or whether he derived the knowledge from some ancient manuscripts; the latter, however, seems the more likely conclusion, as Sir F. Palgrave brought to light in the Bodleian Library a letter from a Spanish friar, Brother Ferrarius, who was a contemporary of Bacon, in which the materials of Greek fire are detailed, differing only in proportions, and in these but slightly, from real gunpowder. That the latter was identified of old with Greek fire, is shewn by the name 'Crake,' applied to the first cannon used. This word, which still survives in 'cracker,' is pointed out by Sir F. Palgrave to be nothing more than a Norman corruption of 'Grec.' Bacon's announcement dates from 1216; but the powder of his time, as made in the West, was not readily explosive, since the materials were but roughly cleared of impurities, and then mixed together on a slab; and probably little use could be made of it as a propellant until the process of granulating had been introduced by Bertholdus Schwartz in 1320. Immediately after this discovery, cannon of small size appeared in the armoury of almost every state, as if their use had been known previously, although no practical effect had been given to the knowledge, on account of the badness of the powder manufactured. These cannon generally consisted of a smaller barrel or chamber to receive the charge, which fitted into a larger one containing the projectile (see fig. 1). It may be safely assumed that these weapons, if terrifying from their noise, were tolerably harmless—at least to the enemy—in their practice. In 1326, the Florentine republic ordered the making of iron shot and cannon for the defence of its villages. In 1327, Edward III. used 'crakeys of war' against the Scotch; in 1339, ten cannons were employed in the siege of Cambray. By 1346, various improvements had been made; and we find in the same year the consuls of Bruges witnessing experiments by one Peter, a tinman, who had constructed a cannon with a square bore, to throw a cubical shot of about eleven pounds; his bolt passed both walls of the town, and unfortunately killed a man on the other side. We have the authority of Villani for believing that Edward III. had three cannon at Crécy; but the cannon then made were, from the little knowledge of casting, limited to about the size of modern duck-guns, and, as has been remarked, three very inferior muskets could have had but little to do with putting 50,000 men to flight.

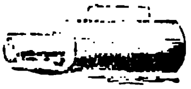

Fig. 1.
From the Santini Manuscripts.

Up to this time, European ordnance had been kept back by the rarity and high prices of sulphur, saltpetre, and iron, the last having been so scarce in England, that it was thought necessary to forbid its exportation by a statute of 28 Edw. III. Still, crude as was their form, and small their number, firearms had established a firm footing in Christendom; their mission of civilisation, and, paradoxical as it may appear, of humanity, had begun. With the first killing discharge, the doom of feudalism had gone forth. Plated armour no longer availed against the weapon of the peasant; and the mailed chivalry, the sinews of previous battles, who had trampled with their iron heels upon popular rights, no longer could carry all before them, but, like other soldiers, were now as loath to be slain by unseen foes as the veriest villein in the host. The people discovered their powers of contending with the noblesse; by degrees, they rose for liberty, and suppressed the tyrannies of the petty lords who had long held them as mere bondsmen. In war, again, as artillery became more general, so the slaughter of battles diminished, for an army outmanœuvred was an army at the enemy's mercy, and therefore beaten; whereas, previously, in the hand-to-hand fights where victors and vanquished mixed pell-mell in single combat, a victory could only be really won when there were no foes left to slay. A battle as great as that at Crécy might now be gained with a loss to the vanquished of not more than 1000 men, instead of the 30,000 who are said to have fallen victims to the English sword or bow.

Dating from the reign of Edward III., the employment of cannon and bombards in siege operations became more or less general. Froissart records that the Black Prince took bombards, cannon, and Greek fire to the reduction of the castle of Romozantin in 1356, but it does not appear that he availed himself of firearms at the battle of Poitiers in the same year. The bombards seem to have been short, capacious vessels, from which stone balls were shot with small charges to a short distance, and at considerable elevation; they were essentially the parents of the present bombs or mortars (see fig. 2). The cannon (*canne*, a reed), on the other hand, were, for some time at least, of extremely small bore, scarcely larger than muskets of the 18th c.; they discharged leaden bullets, and would have probably been used as hand-weapons, but for their cumbrous an workmanship, which necessitated small Arms of this description are doubt

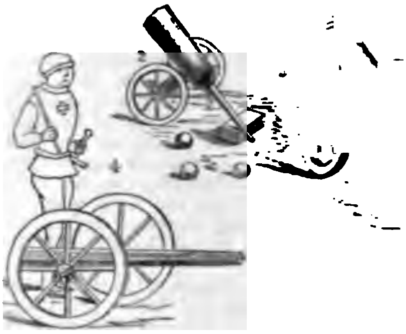

Fig. 2, from the *Chroniques de St Denis*, F Century. Fig. 3, Bombard of the Fifteenth from Froissart. Fig. 4, Cannon of the Century, from *Les Vigiles de Charles VII.*

referred to as having been brought by to the siege of St Malo, to the num pieces, where they are said to have k incessant fire day and night on the town success.

In the 15th c., armies for siege oper usually accompanied by great and latter being intended to keep down besieged while the large bombards were an operation requiring no small time. were gradually improved, but it was not reign of Henry VIII. that the founders casting iron ordnance, to the entire exclu quite the present day, of cannon formed of rounded bars welded together. England then become famous for the workman ordnance. The accompanying sketch (fig found in the wreck of the *Mary Rose*, which

Fig. 5.

Spithead in the above king's reign, will degree of excellence had been attained facture of artillery, little inferior to that lasted till our own day, when rifled rapidly superseding cannon of smooth bore so late as Henry's reign, although great found very serviceable in siege and tions, where the defences of those days a trifling resistance to their power, they have been looked upon rather as an than an advantage with armies in the is attributed partly to the heavy chan guns themselves, and especially of their but more particularly to the badness, absence, of the necessary roads for their In 1522, it is recorded in the state paper 'kinges ordonauns [were] unable to pass More towards Carlile.'

As time passed on, the details of the were improved, the general principles the same; the size of the guns increased proportionate weight of the car limbers (q. v.) were added, and the gradually perfected and lightened. calibre, to which augmented added, the number of cannon— mous—taken with an army was by d now a certain standard proportion between ery and infantry is ordinarily maintained. ee guns to a thousand infantry is the proportion ow considered best (1873). Of course, this propor- on differs with the opinions of various commanders; ut the greatest modern generals have always acted n the maxim, that it is wasteful to send a soldier n any duty of danger which a ball can be made to erform. As a weapon of offence, Vauban doubled e utility of heavy ordnance when he applied the icochet (q. v.) system of firing. Napoleon may most be said to have won his battles by artillery, r he rarely if ever brought his infantry into action cept as supports, until a way had been opened r them, or a panic caused, by the massed fire of rge batteries of guns. The Duke of Wellington devoted the greatest attention to his ordnance- ent; while, referring to recent events, the cam- igns of Lord Clyde in India were remarkable ces of the use of artillery being pushed with dant success to its greatest limit. During the co-German War of 1870-1871, the Prussians considered somewhat behind the age in their d artillery.

non of widely varying bores have at different been cast, and the various sorts became so s in continental armies, as at one time to ch inconvenience from the large quantities munition which it was necessary to carry. Adolphus set the example of reducing to a few standard calibres, and the same ent was immediately adopted systematic- French and other armies. The cannon in use in the British army are detailed article CANNON; but the introduction of s of late years has limited the classes to owing: *Muzzle-loaders* 12-inch, 35 tons olwich Infants'); 13-inch, 23 tons; 11-inch, 25 10-inch, 18 tons; 9-inch, 12 tons; 8-inch, 9 7-inch, 7 tons; 64-pounder; 16-pounder; er; 7-pounder (steel) mountain-gun. *Breech-* —7-inch, 64-pounder, 40-pounder, 20-pounder, er, 9 pounder, 6 pounder. For a particular n of the several sorts of cannon, see CANNON, CARRONADES, HOWITZER.

differs from all other guns in its m, its shortness, and its large bore. ject is the projection of shells by a more or vertical fire, with the intention of breaking and destroying, by weight and explosion roofs of magazines, public buildings, and of sinking a shell deep into earthworks tress, in which it shall explode as a most mine. The different sorts of mortar will ribed under MORTAR. The mortar arose naturally out of the old bombard, and doubtless deviated by degrees more and more from the cannon. Fig. 6 shews a bombard or mortar designed in the 15th century. In very early days, we read in Arabian authors of a cylinder hewn in the rock at xandria, and used as a mortar. Such a cylinder, d of large size, is still to be seen at Gibraltar, it was employed in the last siege against aniards, when it was made to discharge of large stones, which spreading at times ance of 500 yards, constituted a formidable s of defence. In recent years, nearly all guns shells, so that the specific necessity for mortars ally diminished.

Fig. 6.
From Leonardo da Vinci

is a frustrum of a right cone, with a cylinder (bore) removed around the axis; from which it follows that the thickness of metal is greatest at the breech, where it has to withstand the effect of ignited powder in its most condensed, and therefore most powerful state. Guns are first cast in loam or dry sand, then turned to the required shape, and lastly bored with the minutest accuracy. Formerly, they were cast with the bore already formed; but the direction was rarely exactly correct, and the surface scarcely ever strictly even. Some additional particulars of their manufacture will be given under GUN-FACTORIES, ROYAL; and the science of artillery will be summarised under GUNNERY.

An article on firearms would be incomplete without some allusion to the progress made in small-arms. In the 15th c., the smallest sort of cannon were probably at times mounted and used as hand-guns. From this the step to the arquebus was rapid; that weapon developed as years passed into the clumsy matchlock; that into the firelock and flint-musket; then the percussion-musket; and lastly, into the beautiful rifles of our own day, which have culminated in the central-fire breech-loaders. For diminutives, small arquebuses were made to do duty as horse-pistols; genuine pistols succeeded them; these were gradually improved and reduced in size, till they have culminated in the saloon pistol, available for a waistcoat-pocket; and the deadly revolver, which quadruples a man's defensive power. All these weapons are described under their respective heads—ARQUEBUS, MATCHLOCK, MUSKET, PISTOL, REVOLVER, RIFLE.

Many valuable works have been written on firearms from the days of Leonardo da Vinci and Tartaglia to the present. Among those consulted for this article have been *Etudes sur le Passé et l'Avenir de l'Artillerie* of the Emperor Napoleon III.; *Our Engines of War*, by Captain Jervis; Major Straith's *Treatise on Artillery;* General Chesney *On Firearms*, &c.

FIREARMS, PROVING OF (in Law). In consequence of the frequency of accidents from the bursting of insufficient barrels, the legislature has interfered, not to regulate their manufacture directly, but to prevent all persons from using or selling them until they have been regularly proved in a public proof-house. The first act for this purpose, which was passed in 1813, was soon after superseded by the fuller and more complete one (55 Geo. III. c. 59). By this statute, a fine of £20 is imposed on any person using, in any of the progressive stages of its manufacture, any barrel not duly proved; or any person delivering the same, except through a proof-house; and on any person receiving, for the purpose of making guns, any barrels which have not passed through a proof-house. These penalties are to be levied on conviction before two justices, and the like penalties on persons counterfeiting the proof-marks. The statute does not extend to Scotland or to Ireland, and arms manufactured for Her Majesty, are exempted from its operation. By 10 Geo. IV. c. 38, repealing 6 Geo. IV., the malicious and unlawful use of firearms in Scotland is punishable. See GAME LAWS.

FIREBALLS are projectiles occasionally discharged from guns or mortars, for the purpose either of setting fire to, or of merely illuminating some work, against which hostile operations are directed. The usual ingredients are—mealed powder, 2; saltpetre, 1¼; sulphur, 1; rosin, 1; turpentine, 2¼; with pitch, tow, naphtha, &c., as circumstances dictate. The use of fireballs has, however, been in great measure superseded by the introduction of rockets (q. v.), and incendiary shells (q. v.). Akin to the fireball, was the *fire-arrow* of ancient warfare, which consisted of tow steeped in pitch, rosin, or some inflammable mixture, wrapped round the shaft, and fired alight among an enemy's works or troops. Greek fire was also discharged in many cases on large arrows surrounded by tow and shot from *balistæ*.

FIREBOTE, the right of a tenant for life or years, according to English law, to cut wood on the estate for the purpose of fuel. See ESTOVER.

FIREBRICK. See BRICK.

FI'RECLAY is the variety of clay which is employed in the construction of gas-retorts, glass-pots, firebricks, crucibles, &c., which require to withstand high temperatures. It is found chiefly in the coal measures; and the more famous kind is the Stonebridge, which is found in a bed about four feet thick. It also occurs largely near Glasgow, Newcastle-on-Tyne, and in Belgium and France. The principal constituents of fireclay are silica and alumina, accompanied by small proportions of iron, lime, magnesia, water, and organic matter, as may be observed from the following table:

	No. 1.	No. 2.	No. 3.	No. 4.	No. 5.
Silica, . . .	64·10	51·10	48·55	69·25	83·29
Alumina, .	23·15	31·35	30·25	17·90	8·10
Oxide of Iron, .	1·85	4·63	4·06	2·97	1·88
Lime, . .	...	1·46	1·66	1·30	
Magnesia, . .	0·95	1·54	1·91		2·99
Organic Matter and Water,	10·00	10·47	10·67	7·50	3·64

Fireclay is found abundantly, near and at the surface of the ground, and is readily reduced to powder by travelling wheels. When kneaded with water, and fashioned into vessels and other articles, it is dried, and is then generally subjected to a strong heat, which drives off the water and organic matter, causes the silica to unite more firmly with the alumina, &c., and leaves a more or less porous material, which can withstand very high temperatures. The Passau crucibles are merely dried, and are not fired like Hessian crucibles and other fireclay wares. The larger the percentage of silica (sand) in the clay, the more refractory are the articles fashioned from it; and hence sand is often added to clay to increase its fusing-point and refractory powers; but a certain proportion of alumina, &c., is required to serve as a flux, to cement and hold together the particles of sand. The proportions of sand and clay are determined by the temperature to which the manufactured article is intended to be exposed; and the fireclay of crucibles or bricks, which are serviceable at a comparatively low temperature, as in the lining of lime-kilns, would become soft, and yield in glass or porcelain furnaces.

FIREDAMP is the miners' term applied to light carburetted hydrogen or coal gas when it issues from crevices in coal-mines. See GAS.

FIRE-EATING, a name usually given to a variety of feats performed by jugglers with flaming substances, melted lead, red-hot metal, &c. Evelyn, writing under date October 8, 1672, thus describes fire-eating in his day: 'I took leave of my Lady Sunderland. She made me stay dinner at Leicester House, and afterwards sent for Richardson, the famous fire-eater. He devoured brimstone on glowing coals before us, chewing and swallowing them; he melted a beer-glass, and eat it quite up: then taking a live coal on his tongue, he put on it a raw oyster; the coal was blown on with bellows till it flamed and sparkled in his mouth, and so remained till the oyster
gaped, and was quite broiled; then h

proposition 9 of the same work, in which
used in stions' are described,

Hero describes and figures the air-chamber as 'a hollow globe or other vessel, into which if any liquid be poured, it will be forced aloft spontaneously and with much violence, so as to empty the vessel, though such upward motion is contrary to nature.' The globe is represented with a single piston attached for compressing the air. Thus, about 1800 years elapsed before proposition 9 and proposition 27 of this work were put together for so obvious and useful a purpose as the fire-engine, although the book was tolerably well known to the mathematicians of the period; and when they were put together, it was probably done by a practical man, who had never heard of the name of Hero.

The more recently constructed fire-engines include contrivances for preventing the entrance of mud and gravel, and for getting readily at the valves in case of their being out of order, while the cistern is dispensed with, a hose being carried directly to the water-supply. They are usually drawn by two or four horses, though smaller engines are made to be drawn by hand or by one horse. The hose is of leather, fastened by metal rivets, instead of the sewing formerly used. In the United States, cotton is woven into a tube by machinery constructed for the purpose. Two such tubes are fitted one within the other, and held together by a solution of India-rubber, which, on consolidating, forms a water-tight layer.

The fire-engines of the London Fire Brigade establishment have usually 6-inch barrels with 7-inch stroke, and throw about 70 gallons of water per minute. Their weight, with implements, firemen, and driver, is about 30 cwt. These are found more convenient for general purposes than larger engines, as they can be drawn at a gallop by two horses for a distance under six miles. Four horses are used for greater distances. When a large engine is required, two of these may be joined together, and throw 180 gallons per minute. The pumps are worked by levers, with long horizontal bars attached, to enable a number of men to work together upon the same pumps. Many larger engines than these have been constructed, and steam has been successfully applied. The first application of the steam fire-engine was made when the Argyle Rooms in London were burned in 1830. Several floating fire-engines for conflagrations near the Thames have been constructed and worked by steam; one of these is capable of throwing 1400 gallons per minute. A floating engine was used with considerable effect when the Houses of Parliament were burned; but at the fire of the warehouses near London Bridge (1861), the fury of the combustion, when at its maximum height, was so great, that the combined efforts of all the London engines, whether worked by steam or by hand, had no perceptible effect in subduing it. For all ordinary fires, the hand-engines above referred to are the most useful, as they can be brought to the spot and set in action immediately. Nevertheless, so greatly have the steam fire-engines been recently improved, that steam of 100 lb. pressure on the square inch can be raised in seven minutes after making the fire.

It has been questioned whether, in cases of very intense combustion, a comparatively small stream of water has any subduing effect at all; some assert that it may even increase the conflagration. Various chemical liquids have been proposed as flame-extinguishers; but plain water is still the only power used to any extent.

Fire Brigades.—For working fire-engines, a body of firemen are required. The fire insurance companies formerly had separate establishments of fire-engines and firemen; but in 1825 some of them united, and by 1833 all the important companies combined, and the London Fire-brigade was formed, under the management of the late Mr Braidwood, whose death in the discharge of his duties at the great fire just referred to was justly deplored throughout the country as a national loss. In 1865, an act of parliament empowered the Metropolitan Board of Works to purchase the engines and appliances of the London Fire-brigade establishment; to secure the services of the brigade men; to construct additional engines and stations; to map out the metropolis into convenient districts; and to cause the firemen to act in harmony with a salvage corps and a fire-escape corps. The engines now used are very powerful; the manual engines are for 22, 26, 30, 38, and 46 men each; while the steam fire-engines, especially those constructed by Messrs Shand and Mason, on a principle patented in 1870, will throw a jet to a vertical height of 180 feet, or drive water through half a mile of pipe horizontally. At a fire in the East India Docks in 1866, the steam fire-engines poured in the enormous quantity of 3,000,000 gallons. At the latest great fire in London, that of the Alexandra Palace, in June 1873, a powerful force of engines was present, but there was insufficient water to render them effective. The establishment comprises about 400 firemen, 55 stations, 90 manual engines, and 35 steam-engines (5 of them floating). As the Metropolitan Board in London pay a fee to the first person who gives notice of a fire at the engine station, there is always a supply of volunteers from among cabmen and people in the streets, besides policemen, to perform this important service; and in like manner the pump-bars of the fire-engines are always fully manned. The men of the brigade wear a uniform, with strong helmets and metal epaulets, to protect them from the blows of falling beams, &c. The courage and skill of the men in making their way through and about burning buildings, for the purposes of directing the stream from the hose, or for saving life and property, and the general efficiency of the whole organisation, are worthy of the highest praise. The water-supply in London is not so well managed as the engine supply, thereby frustrating the exertions of the firemen.

Most of our provincial towns now have a fire-brigade upon the same model as that of London. The fact that Paris has several times as many firemen as London, is a tolerable proof of the amount of work the London firemen are called upon to perform. At Paris, as on the continent generally, the fire-engines and firemen are under government control; and the *sapeurs-pompiers*, or firemen, are empowered to enforce the assistance of any people they can find in the streets.

In many continental towns, fire-watchmen are stationed in commanding situations, such as church-towers; and their duty is to ring a fire-bell, or otherwise give the alarm, immediately upon observing a conflagration. The fire-companies of the United States are composed of volunteer firemen, who receive no pay, but certain immunities from taxation and militia service. Their annual parade-day is quite a fête. Each company has a special uniform; and in some cities the rivalry among them is so great, that they frequently have desperate fights for the best 'location' for their engines. Prizes are awarded to those who [illegible] a jet of water to the greatest height. An [illegible] system [illegible] give notice from station to station [illegible] fire. Nevertheless, American [illegible] often frightfully [illegible] Chicago in 1871, and at Boston in 1872 and 1873.

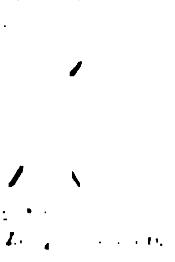
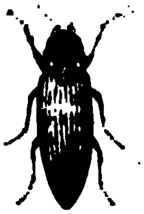
FLY, a name common to all winged
insects, at least to all that possess much



luminosity. Except the lanternfly (q.v.), they are all coleopterous, and belong to two nearly allied tribes, *Lampyridæ*, to which the glowworm (q.v.) also belongs, and *Elateridæ*, to which belong our skipjack beetles, and of which the larvæ are too well known to farmers as wire-worms. The
wworm, which alone is winged, has too little
ty ever to receive the name of F., but the fireflies of the south of Europe (*Lampyris Italica*) and of Canada (*L. corusca*) are nearly allied to it. See GLOWWORM. Fireflies are only seen in the most southern parts of Europe. They abound in almost all the warmer parts of the world, and the brilliancy of the spectacle presented by them when glancing about in numbers amidst the darkness of night, has been often described with enthusiastic admiration. Mr Gosse says of the Canadian F.: 'The light is of a yellow colour, very different from the blue gleam of the English glowworm: from this circumstance I at first took them for candles in the woods, and though told what they were, at every one that appeared, the same idea would come across my mind. . . . They more frequently give out the light while flying, than when crawling or resting, though we may often observe the intermittent gleam as one crawls up a stalk of grass, or rests on the leaf of a tree. They fly slowly, and as they fly, emit and conceal their light with great regularity at intervals of two or three seconds; making interrupted lines of light through the air, gleaming slowly along for about a yard, then suddenly quenched, and appearing again at the same distance ahead. The insect is a pretty beetle, with soft elytra, of a light-brown colour, marked with red, and handsomely striped; the light proceeds from the last three segments of the abdomen, which are of a delicate cream colour by day. At night, these three segments are bright at all times; but at the regular intervals I have mentioned, they flash out with dazzling splendour. If this part be plucked off and crushed, many patches of brilliance occur for a few moments among the flesh, but they gradually die away.' He further describes these fireflies as appearing in great numbers in summer evenings, over wet and marshy ground, millions of them above a river, or over the surface of a large field, like stars on a clear winter night, but flashing and disappearing, and moving about in mazy evolutions. But still more brilliant are the fireflies of more tropical regions, belonging to the tribe *Elateridæ*, as the F. of the West Indies (*Elater noctilucus*), which gives out its light chiefly from two eye-like tubercles on the thorax. The light is so powerful, that the smallest print may be read by it; and this becomes quite easy if a few of the insects are enclosed in a small glass vessel. They are not unfrequently employed—particularly in St Domingo—to give light for household purposes; and they are used for purposes of decoration on festival-days by women, who attach them to their dress or to their hair. One which had been accidentally brought alive to Paris, once astonished and alarmed the Faubourg St Antoine. These insects are caught in some parts of the West Indies—a torch being used to attract them—and brought into houses to destroy mosquitoes, which they eagerly pursue and devour. See LUMINOSITY OF INSECTS.



Firefly (*Elater noctilucus*).

FIRELOCK, the name applied on its introduction, in 1630, to the old musket, which produced fire by the concussion of flint and steel, to distinguish it from the *match-lock* previously in use, which had been fired by the insertion of a lighted match at the powder-pan. Writers of the earlier part of the 18th c. called fire-locks 'snaphans;' a word obviously corrupted from the Dutch *snaphaan*, and leading to the inference that they were brought to England by

William III. and his Dutch auxiliaries. Their first invention is, however, involved in obscurity. The weapon was superseded before 1830 by the percussion musket; which, in its turn, has now yielded to the rifle (q. v.).

FIRENZUOLA, Angelo, an author distinguished for the Attic choiceness of his language, was born at Florence in 1493. Having completed at Perugia the studies which he commenced in Florence, he proceeded to Rome in anticipation of a brilliant legal career, but shortly abandoned the eternal city, disappointed in hope and shattered in health. It seems well authenticated, that he finally enrolled himself among the monkish brotherhood of Vallombrosa, and rose to considerable influence, in spite of the extreme licence of morals, and licentiousness of writing for which he was noted. The date of his death is doubtful, but it is generally placed between 1542 and 1544. His chief works are a spirited paraphrase of the *Golden Ass of Apuleius*—in which he is generally considered by his countrymen to have far excelled the original in nerve and beauty of language; *I Discorsi degli Animali*—containing some sound lessons of just legislation to the ruling powers, the censure being skilfully veiled by means of his animal orators; *I Ragionamenti*, a work in close imitation of the *Decameron* both as regards the impurity of sentiment, and classic purity of language; *Il Trattato della bellezza delle donne*, an eulogistic discussion concerning the charms of the gentle sex, to whom he was inordinately devoted. His works were published in Florence after his death. The best edition is that of Florence (1763, 3 vols.).

FIRE-POLICY. See Insurance.

FIRE-PROOF BUILDINGS. The problem of constructing warehouses, dwelling-houses, &c., that shall be proof against all risk of conflagration, has not yet been solved. The liability to conflagration may be greatly diminished by the construction of a building, but cannot be entirely averted; and therefore, in all 'fire-proof' buildings containing furniture or other combustible materials of any kind, the ordinary precautions against fire should be strictly observed. It is well to state this at the outset, as, unless it be understood, a so-called fire-proof building may be more dangerous than an ordinary one, especially in warehouses, &c., intrusted to the care of watchmen and others, who, relying upon the supposed immunity the name expresses, are liable to neglect many precautions they would not fail to observe in a building believed to be dangerous. The most destructive fire that has occurred in London since 1666 was that at Cotton's Wharf, in 1861, the warehouses of which were what is called 'fire-proof.' The great fury of this conflagration depended on the nature of the goods that were stored. It is scarcely possible to believe that such combustibles as tallow, turpentine, &c., could have been stored in the vicinity of saltpetre, unless there had existed some faith in their practical isolation from each other by the fire-proof divisions of the building, as it is so well understood that saltpetre, though incombustible of itself, intensifies to an immense extent the combustibility of all combustibles, by supplying them with undiluted oxygen when heated in contact or within a moderate distance of them.

The nearest approximation to fire-proof construction may be obtained as follows: the walls should be of stone or brick, and any ties, lintels, &c., required in the construction should be of iron. The staircases should be of iron or stone, and the floors or landings of tiles, concrete, or stone. Wherever wood is inevitably used, it should be prepared with silicate of soda (see Fire-proofing). Instead of wooden joists to support the floors of each story, arched stone or brickwork should be used, and this should be put together with sufficient care to be independent of the mortar. The roof should be constructed in like manner, wooden rafters being entirely excluded. The doors should be of iron, and the security would be much increased if the doors between any two apartments containing combustible materials were double, with a space between them equal to the thickness of the walls. Of course, it is not practicable to carry out all these precautions in a dwelling-house, but the danger from fire may be considerably diminished by attending to some of them. Wooden staircases are especially dangerous. The most important conditions for a warehouse are, that each apartment shall be separated from the next by stout walls of non-conducting materials, and more especially, that each shall be as nearly as possible air-tight; and whenever, from the nature of the goods, ventilation is required, it should be obtained by periodically opening the doors and windows. If this latter condition is fulfilled, any fire would extinguish itself, unless there be along with the combustible goods some oxygen-giving substance, such as saltpetre, chlorate of potass, or other nitrates or chlorates.

At first sight, it may appear that a warehouse built entirely of iron, would be effectually fire-proof, but this is far from being the case. In the first place, iron conducts heat more readily than any other material used in building; secondly, cast-iron is liable to crack and split when suddenly heated or cooled. Iron supports may, under some circumstances, be even more objectionable than wood, for if the water from a fire-engine were to play upon a heated cast-iron girder, it would probably give way immediately, while a stout wooden beam might be extinguished before being burned through. When buildings supported by iron girders are burning, they are far more dangerous to firemen than those with wood, as the experienced fireman can form a pretty accurate judgment of the time that burning wooden beams will stand, and may move about in their vicinity to direct the stream of water to where it is most needed, but iron girders split and fall without visible notice. It is on this account that floors of arched masonry are recommended above. In great fires, the heat is sufficient to fuse iron.

Without going to the expense of making warehouses and manufactories absolutely fire-proof, certain precautions not of a costly nature might be usefully adopted, for the purpose of merely checking the progress of conflagration until the arrival of fire-engines. Among these simple measures, may be included iron doors hinged on stone between different departments; a sufficient deafening not easily destructible between the ceiling of one story and the floor of that above; and stone stairs. For rendering timber difficult of combustion, see Fire-proofing.

FIRE-PROOF SAFES AND REPOSIT are used as receptacles for deeds, paper- account-books, and other valuables. They ar- regular articles of commerce, and are to be in almost every counting-house, lawyer's jeweller's or watchmaker's shop or wareh- are indispensable to banking and such-like esta ments. Our forefathers used oaken chests a with iron straps and studs for similar purp- That which formerly contained the crown-jewels of Scotland, and is still exhibited in Edinburgh Castle, is a good example. Subsequently, iron chests made simply of stout cast or wrought iron were used rn safe has double walls and doors of plates, and the space between the plates ith some substance that shall resist the on of the heat which would be readily through solid iron. The materials used inings are very various—sand, dried clay, shes, bone-dust, alum, gypsum, &c. The lessrs S. Mordan & Co., which are largely akers, are lined with a mixture of equal aw-dust and alum. Some makers include sels containing liquids, the vessels burst ted, and the liquids exert some cooling lum acts in nearly the same manner. It 4 equivalents of water, or nearly half its At 212°, ten equivalents are driven off in t 248°, ten more; and at 392°, the four equivalents are volatilised. It is a mistake, to suppose that any of these linings can h a safe really fire-proof; and this is by the more scrupulous manufacturers, ally abstain from using the designation roof,' but apply that of 'fire-resisting,' ently describes all that they are capable s they may resist the action of fire for able time; but whether or not their ay be ultimately preserved from a fire, a question of the duration and inten- heat to which they are exposed. Their t in some cases assists in preserving ally when on an upper floor, as such a be the first thing to break through the ists and descend to the lower part of the here the fire is usually the most smothered. s are sometimes let into recesses of stout built on purpose, and protected by an double iron door. This, of course, adds their security. All such safes should of secured by the best locks that can be ected by every possible precaution against owing up by gunpowder, or other violence.

ROOFING. Attempts have continually to render cotton, linen, and other textile nber, &c., incombustible; but at present been but partially successful. There are ns by which fabrics may be prevented ng, their combustion being reduced to a ldering; and the many recent cases of from the present extravagant dimensions sence have rendered the adoption of some ction against fire very desirable. By the fabric with a solution of any saline which, upon drying will leave minute leposited in or between the fibres, its ility will be greatly diminished, but the s a degree of harshness to the fabric, and nes weakens the fibres. Alum, sulphate d sulphate of soda have been used, and al to prevent flaming, but they weaken Common salt does the same. Phosphate ate of ammonia are less objectionable on t, but the former decomposes by contact ot iron in ironing. Tungstate of soda has sed, and is said to have no injurious effect re. Sulphate of ammonia, chloride of sal ammoniac), and borax, are among the for domestic use, though they are not nable. For made up clothing, borax is he best, as it is most effectual in its l is the least injurious to the appearance ticle, though it is stated to have some effect on the fibre; this, however, is only in case of a tearing strain, and will not damage such articles as ladies' under- r anything else only subject to ordinary od has been treated in a similar manner. Milk of lime, alum, sal ammoniac, sulphate of ammonia, chloride and sulphate of zinc, sulphuret of lime and baryta, &c., have been used, and its *inflammability*, but not its *combustibility*, is destroyed. Like the fabrics, when similarly treated, wood smoulders slowly. The most efficient protection to wood is silicate of soda. If planks of moderate thickness be brushed three or four times over, on each side with a strong solution, they are rendered almost incombustible; they will only burn when very intensely heated. The silicate fuses and forms a glass which envelopes the surface, and even the internal fibres of the wood, if it be sufficiently saturated, and thus seals it from the oxygen of the air.

FIRE-RAISING, in the law of Scotland, is the equivalent term for Arson (q. v.) in England. If any part of a tenement, however small, has been set fire to wilfully, this crime has been committed. It is quite indifferent where the fire has commenced, and the offence is frequently perpetrated by setting fire to furniture, or to other objects either within or without a house; but it is not regarded as completed, and is punished as a separate crime, of which we shall speak afterwards, unless the fire has communicated itself to some part of a building. If the fire originated in carelessness, however gross, it is not wilful fire-raising, but a minor offence, punishable with fine and imprisonment. But if the intention was to injure the proprietor of a tenement by burning, not his house, but an object in its neighbourhood e. g., a haystack—and the fire was accidentally communicated to the house, the offence is the same as if the fire had been applied to the house directly. The infliction of capital punishment for the offence of fire-raising is now in desuetude. Where a man burns his own house without endangering the life of any one, he has not committed the crime of fire-raising, but he may be punished criminally, if the act was done for the purpose of defrauding the insurers. Till recently, it was the rule in Scotland, that where fire was the result of inevitable accident, it freed a carrier or innkeeper from responsibility for any goods that were destroyed in his custody, unless where fraud or collusion could be shewn; but the law in this respect has been altered by the Mercantile Law Amendment Act, 19 and 20 Viet. c. 60, which provides, s. 17, that after the passing of the act (1856), 'All carriers for hire, of goods within Scotland, shall be liable to make good to the owner of such goods all losses arising from accidental fire while such goods were in the possession or custody of such carriers'—thus equalising the law of Scotland with that of England.

Attempting to set fire to houses, crops, &c., is a distinct crime from Arson (q. v.), or the actual destruction of property by fire. By 9 and 10 Vict. c. 5, it is enacted, that if any one shall attempt to set fire to a house, &c., with such intent that the offence, if committed, would be felony, and liable to be transported for life, he may be transported for fifteen years (now penal servitude), or imprisoned for two years. The attempt to burn growing crops of corn, &c., is a felony by 7 and 8 Geo. IV. c. 30, and punishable by transportation for seven years, or by imprisonment. These offences are also misdemeanours at common law. By 24 and 25 Vict. c. 97, s. 8, the attempt to set buildings on fire is punishable by penal servitude for fourteen years, or imprisonment for two years; if a male under sixteen, to be whipped.

In Scotland, an attempt to commit wilful fire-raising (q. v.) is an offence at common law. It is not necessary to constitute this offence that the fire should have consumed any part of the building, &c. Furniture as a mattress—partly consumed, [illegible] early age, he went with his [illegible] to India, where [illegible] at Ahmednagar [illegible] the instruction which [illegible] Imam Hussein Nizam [illegible] captain in the body [illegible] when this ar[illegible] fell [illegible] afterwards. MAN, a word of Persian origin, signifies an and is used by the Turks to denote any decree emanating from the Ottoman Porte. of signing any firman relating to affairs with his special department is exercised y minister and member of the divan, but e of placing at the head of the firman the —a cipher containing the name of the sultan laced letters, and which alone gives effect to ree—is committed to the hands of a special who is called *[illegible]*. The name such decrees as have been signed by the lf is *hatti-sherif*. The name firman signify a more formal kind of Turkish which can only be granted by the sultan pasha. A written permission to trade is India a firman.

-BORN (Heb. *B*[illegible], Gr. *prototokos*, Lat. *-tus*), in scriptural use, signifies the first ring, whether of man or of other animals. inciple of the Mosaic law, and indeed of the law of nature, it was established that the of all the produce of creatures, whether or inanimate, were in some sense due to eator as a recognition of His supreme n. See FIRST-FRUITS. Under the title from this recognition are to be classed many nces regarding the first-born of animate whether rational or irrational, which pre- among eastern nations generally, or which ially established by the Mosaic law: 1. The n male, whether of men or of animals, was from the time of birth to God. In the first-born male children, the law required ithin one month after birth, they should be ed by an offering not exceeding in value five of silver (Exod. xiii. 13). If the child died the expiration of thirty days, the obligation of tion ceased; but if that term were completed, igation was not extinguished by the subsequent death of the infant. The redemption took ccording to a fixed ceremonial. The first- ale of animals also, whether clean or unclean, was equally regarded as devoted to God. The first-born of clean animals, if free from blemish, was to be delivered to the priests within twelve months after birth, to be sacrificed to the Lord (Deut. xv. 21); nor was it permitted to any but the priests to partake of the flesh of such victims (Num. xviii. 18). If the animal were blemished, it was not to be sacrificed, but to be eaten at home (Deut. xv. 22). The first-born of unclean animals, not being a fit subject for sacrifice, was either to be put to death, or to be redeemed with the addition of one-fifth of its value (Lev. xxvii. 27; Num. xviii. 15). If not redeemed, it was to be sold, and the price given to the priests. 2. Primogeniture, both by the patriarchal and by the Mosaic law, had certain privileges attached to it, the chief of which were the headship of the family, and a double portion of the inheritance. Before the time of Moses, however, it was in the power of the father to decide which among all his sons should be considered the first-born. Moses ordained that the right should invariably belong to the first-born in point of time.

Among other nations, considerable variety existed as to the succession of children to the inheritance of their parent. The Greeks, especially the Athenians, excluded the females of a family so rigorously from the inheritance, that in the event of a father dying intestate and without heirs-male of his body, the nearest male kinsman succeeded to the estate. The later Romans, on the contrary, placed daughters on the same footing with sons as to the division of intestate property. The Mohammedans gave the daughters a certain share of the father's estate, but only one-half of that assigned to the sons. All the nations of Germanic descent restricted the succession, especially in land, to heirs-male. But the Visigoths in Spain admitted females, except in certain contingencies.

The rights of the first born in English and Scotch law are noticed under SUCCESSION, PRIMOGENITURE, &c. In France, the law of primogeniture fell at the Revolution, in common with many other relics of the feudal system. How far the results of the change have been beneficial, is still a moot-question among political economists. In the state of Virginia, also, after the American revolution, a similar change took place; and that the change has been in accordance with public opinion in that state may be inferred from the fact, that a parent now commonly makes, by will, the same disposition of his property as that which would be provided by the law itself in the case of his dying intestate.

FIRST-FRUITS (Heb. *reshith*, Gr. *protogennemata* and *aparchai*, Lat. *primitiæ*), that portion of the fruits of the earth and other natural produce, which, by the usage of the Jews and other ancient nations, was offered to God, as an acknowledgment of His supreme dominion, and a thanksgiving for His bounty. Among the Jews, the institution of first-fruits comprised both public and private offerings.

Of the former class, there were three principal offerings: the first was at the opening of the corn-harvest. On the day after the Passover Sabbath, the 16th of the month Nisan, a sheaf of new corn, which was cut and gathered with much solemnity, was carried to the Holy Place, and there waved before the altar (Lev. xxiii. 5 and foll.); nor was it permitted to commence the harvest-work till after this solemn acknowledgment of the gift of fruitfulness. Again, at the Feast of Pentecost, two loaves of leavened bread, made from the flour of the new harvest, were waved, with a similar form of worship, before the altar (Ex. xxxiv. 22). Thirdly, at the Feast of Tabernacles, in the 7th month, was held the great feast of the gathered-in harvest, the final acknowledgment of the bounty of God in the fruits of the year (xxiii. 16).

Besides these public offerings of first-fruits on the part of the entire people, individual Jews were bound to private offerings, each upon his own behalf. 1. A cake of the first dough of the year was to be offered to the Lord (Num. xv. 21). 2. The 'first of all the fruits' were to be placed in a basket, and carried to the appointed place, where the basket was to be offered with a prescribed form of words, commemorative of the sojourn of Israel in Egypt, and of his deliverance by the strong hand (Deut. xxvi. 2 and foll.). All these offerings were divided into two classes—the first, which were called *Bicurim*, comprised the various kinds of raw produce, of which, although the law seems to contemplate all fruits, seven sorts only were considered by the Jewish doctors to fall under the obligation of first-fruit offering—viz., wheat, barley, grapes, figs, pomegranates, olives, and dates. The law lays down no rule as to the quantity of the first-fruit offering; and it would be tedious to enter into the many questions regarding it which have been raised by the commentators. It was customary for the offerers to make their oblations in companies of twenty-four, and with a singularly striking and effective ceremonial.

The second class of first-fruit offerings were called *Terumoth*, and comprised the produce of the year in the various forms in which it is prepared for human use, as wine, wool, bread, oil, date-honey, dried onions, and cucumbers. As to the quantity of these offerings, and the persons on whom the obligation fell, there are many discussions, for which we must refer to the biblical authorities.

Under the kings, and again after the captivity, much laxity crept into the observance of this practice, which Nehemiah laboured to revive in its primitive exactness. Offerings analogous to the Jewish first-fruits became usual very early in the Christian Church, as is clear from a passage in Irenæus (*Adv. Hær.*, b. iv. c. 17 and 34); but the extent to which it prevailed, and the amount and general character of the oblation, are exceedingly uncertain. It appears to have been merged in the legal provision established by the emperors.

The medieval ecclesiastical impost known under the name of *primitiæ*, or first-fruits, and sometimes of *annates* or *annalia*, was entirely different. By the word, in its medieval and modern sense, is meant a tax imposed by the popes on persons presented directly by the pope to those benefices which, by the canonical rules, or in virtue of privileges claimed by them, fall within the papal patronage. Persons so presented were required to contribute to the Roman see the first-fruits (that is, the income of the first year) of their benefice. During the residence of the popes at Avignon, when the papal necessities compelled the use of every means for eking out a precarious revenue, the impost was sought to be extended to every benefice; and this claim was the subject of many contests, especially in Germany and in England, where the claim, so far as regarded direct papal presentation, had existed from the reign of King John. Henry VIII., by two successive statutes (25 Henry VIII. c. 20, and 26 Henry VIII. c. 3), withdrew the right of first-fruits from the pope, in order to transfer it to the king; and he established a special court for the administration of first-fruits, which, however, was soon disused. In the reign of Anne, the revenues arising from this impost in England were vested in a Board, to be applied for the purpose of supplementing the incomes of small benefices (2 Anne, c. 11). A similar change was introduced in Ireland by t 2 Geo. I. c. 15; but in the latter kingdom t payment was entirely abolished by the 3 and Will. IV. c. 27. In France, this tax was abolish by the 'Pragmatic Sanction' enacted at Bourg in 1438, and subsequently by the *Concordat* Leo X. with Francis I. in 1512. In Spain, ceased partially in the reign of Ferdinand a Isabella, and finally under Charles V. In German it formed one of the first among the *Centum Gra mina* presented to the emperor in 1521, and t claim ceased altogether from that period.

FIRTH. See FRITH.

FISCHART, JOHN, a very extraordinary Germ author, was born either at Mainz or Strasb probably about the year 1545. Regarding his l we know very little. He was by profession a juri but his writings exhibit an immense learning a reading in all the departments of human knowled About 1570, he made a journey to England. Tow 1580, he was living at Strasburg in terms of cl friendship with the eminent book-printer, Bernh Jobin. During 1581 and 1582, he was adv to the Imperial Chamber at Speier, and in became bailiff of Forbach, where he probab about 1590. Of the very numerous writi appeared 1570—1590, partly under his partly under various fictitious names, ab have been proved to be on the whole though disfigured by interpolations. In others, however, the authorship is doubt original editions of almost all F.'s w extremely rare, but new ones have recent published. His most celebrated works on foreign models, particularly Rabelais, is no servile imitation manifested: a free genius works plastically on the materials. class belong his *Aller Praktik Grossmutter* (*Assentheurlich Naupengehörliche Geschicht von U. S. W.* (1575), *Podagrammisch Trost lein* (1577), *Binenkorb des Heyl. Römischen schwarms* (1579), and *Der Heilig Brotk* These writings are wholly satirical. most inexhaustible humour, he lashes corruptions of the clergy, now the fancies, the dull pedantry, or other follies, private, of the time. Next to these outrageously comic work of F.'s—quite its conception—entitled *Flöhatz, Weibertr* Essentially different in its homely and is his *Das glückhafft Schiff von Zürich*, verse, and published in 1576 (new edition by 1829). Similar in point of style are his *und Geistliche Lieder* (1576; new edit. Ber The rest of F.'s numerous writings, partly partly in verse, are of unequal merit, varied in style and contents; the p being in general more complete than the What gives so high a value to F.'s satirical is the warm and genuine feeling which he for the moral foundations of all public an life—viz., religion, 'fatherland,' and the feeling which betrays itself in his wild His works are, moreover, one of the riche from whence to draw information with the manners of his time. But perhaps t extraordinary thing about F. is his tre the language. No German author can be with him, not even Jean Paul Richter him coins new words and turns of expression, any regard to analogy, but nevertheless the greatest fancy, wit, and erudition in arbitrary formations. The fullest collec writings is in the Royal Library at B a critical account of the investigations

F. and his works, see Volmar in Ersch and Gruber's *Encyclopædie* s. 1, vol. 5).

FISH, a naval term of various application. The *fish* is an apparatus of pulleys employed in dragging the flukes of the anchor towards the bow after it has been hoisted to the cat head. *Fish-front*, or *paunch*, is a long piece of oak, or fir, convex without, concave within, securely fastened on the injured portion of a sprung mast or yard, to which it imparts rigidity. *Side-fishes* are long pieces of timber dove-tailed on the opposite sides of a made mast, to give it a circular form and the requisite diameter.

FISHER, John, Bishop of Rochester, was born in 1456 at Beverley, in Yorkshire, educated at Michael House College (now incorporated with Trinity College), Cambridge, where he took his degree in 1491, and of which he became master in 1495. Margaret, Countess of Richmond, mother of Henry VII., charmed by the report of his virtues and learning, next appointed him her chaplain and confessor. In 1501, he was elected chancellor of the university; and in 1502, became first Margaret Professor of Divinity. Two years later, he obtained the bishopric of Rochester. For many years after this appointment, he laboured diligently for the welfare of the church and the universities. The Reformation of Luther found in him as might have been expected from his devout ecclesiasticism—a strenuous, if not an able opponent. In 1527, a rupture took place between him and Henry in [illegible] to the divorce of Queen Catharine. F. [illegible] to declare the marriage unlawful. From [illegible] period, he figures in the politico-religious strifes of his time as a stanch adherent of the papacy. He opposed the suppression of the lesser monasteries in 1529, and the acknowledgment of Henry as head of the church in 1531, and thereby excited the dislike of the party of progress in the English nation. His credulity [illegible] many would apply a harsher term [illegible] reference to Elizabeth Barton (q. v.), the 'Holy Maid of Kent,' involved him in a still more perilous antagonism to the king. He was imprisoned; and on refusing to take the oath affirming the legality of Henry's marriage with Anne Boleyn, he was committed to the Tower, April 26, 1534, where he was treated with great barbarity. A kind but inconsiderate act of Pope Paul III. now hastened the destruction of the old man. His Holiness, as a reward of his faithful services, sent him a cardinal's hat in May 1535. When Henry was informed of this, he exclaimed: 'Mother of God, he shall wear [illegible] on his shoulders, then; for I will leave him never a head to set it on.' His ruin was now certain. He was accused of high treason, and after a brief trial, was condemned, and executed, 22d June 1535. F. was one of those unfortunate persons who, with abundance of personal virtues, find themselves opposed to the overwhelming tendencies of the times in which they live.

FISHERIES. The capture of various kinds of fish for the purpose of trade has always been extensively carried on in maritime countries, and in those which are watered by large rivers; and has been the means in many instances of adding greatly to their prosperity. In Great Britain and Ireland, especially, this pursuit affords remunerative employment to a large proportion of the population, and forms an unequalled nursery for sailors to recruit the royal navy.

The art of capturing fish, like other arts, has been brought only by degrees to its present perfection. In remote ages, fish were caught in the rudest manner by men who lay on the rocks, ready to shoot them with arrows, or transfix them with spears. Even yet, in places which are only partly civilised, fish are taken with blankets or sheepskins; and a roughly made spear, known as a leister, is still used in the country districts of the United Kingdom in the illegal capture of salmon. Advancing intelligence, however, and the use of fish as an article of barter for other kinds of food, soon led to more effective modes of capture. Persons who dwelt on the sea-coast began to exchange fish for animal food killed by the inland hunters, and in this way initiated a commerce which is now represented by a vast amount of capital and enterprise.

The importance of fisheries, as bearing on the food supplies of nations, inland as well as maritime, and as forming a remunerative outlet for labour, can scarcely be overestimated, more especially as fish has ever been in the greatest demand by all classes of the people, and has been in use for human food from the most remote periods. Previous to the Reformation, it was in universal demand in Britain, being the prescribed diet during the fasts appointed by the church.

One great peculiarity of this source of wealth is that, with slight exceptions, the sea-harvest (if we may so call it) is ripened, without trouble or expense for the fisher, who only requires to provide the means of gathering it; and that, under certain regulations, it is free to all comers. River fisheries, except for salmon, are unproductive in Great Britain; and Lochleven is the only British fresh-water lake the produce of which is marketable.

The principal fisheries of Great Britain include the capture of salmon, herring, cod, soles, turbot, mackerel, lobsters, oysters, &c. Immense quantities of these are in constant demand: the various lines of railway that branch inland from the coast afford a means of rapid transit, and have in consequence considerably enhanced the value of sea produce, much of which was at one time useless for want of sufficiently rapid conveyance to those seats of population where it would have found ready sale. It is affirmed, indeed, by those who have studied the subject, that increased demands, consequent upon improved facilities of transit, have affected the fisheries, and rendered them less productive than formerly. The machinery of capture is being extended every year, and the supplies have now to be brought from greater distances, the shoals frequenting the coast lines being much exhausted by the incessant inroads made upon them by the fishermen.

It is difficult to obtain reliable statistics of the different fisheries. Excepting the government Board for Scotland, there is no recognised authority on the subject. The following figures, bearing on the herring-fisheries of Scotland, which are the most important fisheries of the United Kingdom, are taken from official returns made by the commissioners, and annually laid before parliament. They only represent the quantity of herrings which is 'cured;' but immense numbers of that fish are sold fresh, as taken from the sea. The number of barrels cured in 1870 was 833,160, and in 1871 the number was 825,475. If each barrel contained 700 herrings, the number cured in the latter year would be 577,832,500. It would be no exaggeration to say that an equal number would be sold *fresh*. A large number of the barrels were branded by the government inspectors, a sum of £5780 being paid by the curers for this certificate of excellence. The number of boats engaged in the herring-fishery of 1871 was 15,313, the fishermen and boys employed in the fishing numbered 46,346 persons; and the estimated value of the boats and nets employed in the fishery is £890,019.

[illegible] perforated boxes, in [illegible] to answer the demand [illegible] supplies at least two-thirds [illegible] consumption of which [illegible] estimated at 60,000. The [illegible] British seas have now to be sought [illegible] distances from the shore than [illegible] obtained on the immediate coast [illegible] small and technically called [illegible] of course, yield [illegible] as the larger fish. There is also [illegible] demand for oysters, and a considerable [illegible] our maritime population [illegible] livelihood by breeding and [illegible] Whitstable, in Kent, and at various [illegible] there are dépôts for sorting [illegible] The 'spat' is procured [illegible] of four years into a market [illegible] value the wholesale prices [illegible] having been doubled between [illegible] 1873. The oyster used to [illegible] on the British coasts, but [illegible] natural beds have been so largely [illegible] that they are becoming exhausted. The [illegible] of Ireland are now very nearly [illegible] In America, the oyster is a [illegible] notwithstanding a constantly increasing [illegible] the natural beds are still [illegible]

Whilst sea-fisheries are open to all who have [illegible] of working them, salmon-rivers are for [illegible] part private property. The owners of [illegible] streams usually form themselves [illegible] chiefly for the protection of the [illegible] the spawning season. The usual [illegible] the 'lairds' to let their fishings [illegible] are called 'tacksmen,' and whose [illegible] and sell all the fish they [illegible] obtained are, in some instances, very [illegible] and form a handsome addition to the [illegible] proprietors. Before the invention of [illegible] and previous to the introduction of [illegible] and railways, salmon used to be [illegible] through the country towns by cadgers at a [illegible] whilst it was sometimes sold [illegible] markets at twopence per pound. When [illegible] increased demand for it, created by [illegible] conveyance, caused it to attain [illegible] tacksmen were tempted [illegible] streams, and the consequence was the [illegible] exhaustion of particular rivers; [illegible] the legislature in passing one or two [illegible] of parliament, the salmon-fisheries are [illegible] 1873 proving very remunerative [illegible] having again [illegible] plentiful and increased [illegible] of the river Tay, in 1872, was £17,[illegible] pay such a rent, and provide [illegible] expenses of the various fishing-stations [illegible] salmon and grilse, of the average weight [illegible] would require to be captured. See SALMON FISHERIES.

The following statement of the number of boxes of salmon received in London for the year 1872 will afford an index to the value of the British salmon fisheries. Each box contained 112 lbs. The English rivers include those of Wales:

Scotch,	[illegible]
Irish,	[illegible]
English,	[illegible]
Dutch,	[illegible]
Norwegian,	[illegible]
Swedish,	[illegible]
Total for 1872,	[illegible]
" for 1871,	[illegible]
Decrease,	[illegible]

It is impossible, from the paucity of reliable formation, to do more than roughly estimate the ount of capital employed in the British fisheries, the value of the stock of boats, nets, and other ments of capture. However, it is certain that value of the annual produce of British fisheries all kinds is not less than £5,000,000.

A semi-official estimate has been very carefully mpiled of the supposed total annual value of the heries of Scotland (exclusive of salmon), with the llowing result:

Herrings,	£960,485
Sprats,	7,022
Cod and Ling,	206,201
Haddock and Whiting,	264,595
Turbot and other flat fish,	12,280
Oysters,	14,100
Lobsters, &c.,	32,269
Mussels and Whelks,	8,479
Total,	£1,505,431

ing that as many salmon are eaten in d as are sent to London, that would give boxes of 112 lbs. each; and taking the price as five pounds per box, the sum, the above, would be £230,280, making total of £1,735,711. No materials exist for a detailed estimate of the annual value of sh coast-fisheries. The Irish sea-fisheries ly declining. In the year 1846, there were 20,000 boats and vessels of various sizes in the Irish fisheries; but in 1872, the employed in the fishery was only 8000. In the number of men and boys employed in tion with the sea-fisheries of Ireland was in 1872, the number shewn in the returns a little over 31,000. Within a year, the of boats had decreased by a thousand, and shermen and boys by 7000.

ood-fisheries of France are now becoming sive with those of Britain, so far as the of sea-fish and crustaceans are concerned. large number of sardines are annually and cured in the French seas, the cure of fish being a very remunerative industry rranean and other places. In the culti of those less important fishes which thrive lakes, canals, and rivers, the French excel while we only cultivate these for pur of amusement (see ANGLING), the French make them an article of commerce, and considerable sums of money from their At one time, the whole fresh-water fisheries g to France were not of so much value of our salmon streams; but by means of al cultivation and careful nursing, they have much increased in value, and, by the care of ernment, are being yearly improved. The ater fisheries of France are of great extent, of the fishponds in that country being of thirty thousand acres. These fisheries more or less under the control of the rnment. In Paris, the annual consumption h has been estimated to give for each indi 30 lbs. of sea-fish, and 1 lb. of fresh-water

ng the foreign fisheries most worthy of notice river-fisheries of Germany, where the cul the Danube salmon and other fresh-water assiduously carried on. In the Mediter various kinds of fish are taken, the one of eatest value being the tunny. The anchovy and rdine are also taken in large quantities. An count of the great eel-fishery at the mouth of the , on the Adriatic, has already been given in this rk. See COMACCHIO. The Dutch are at present industrious upon the sea as they were at the time when they founded Amsterdam, and a large proportion of the population of Holland are engaged in their fisheries, which are still a source of wealth to that kingdom. The herring, although not taken by the Dutch in such large quantities as formerly, is as carefully cured as ever, Dutch-cured herrings having a great reputation. Excellent salmon are taken in the mouths of the Rhine, many of which are sent to London for sale, as they can be eaten at a time when British salmon cannot be obtained. The Norwegian fisheries afford large quantities of lobsters and turbots, while from Newfoundland is derived a plentiful supply of cod or ling. The Newfoundland fisheries, which are principally for cod, have existed for upwards of three centuries. Sir Francis Drake was the first person who fished there on behalf of England, and the fish he sent home soon excited a spirit of enterprise in the country, which led to the dispatch of a large number of ships and the extension of the fishery. The island is surrounded by the cod-banks, and the capture and cure of this fish form the staple occupation of the people. In America, immense quantities of shad are bred artificially in order to aid the natural supplies; the 'pisciculture' of salmon has also been commenced on a large scale, that fish having become scarce near the seats of great population. See NEWFOUNDLAND.

The oil-fisheries are not so important as they were at one time, the invention of gas and the discovery of other lubricants having rendered us independent of whale oil. The success of the whale-fisheries has also fluctuated so much as to prevent modern capitalists from embarking very largely in the trade. The only novelties that distinguish the whale-fishery of the present day are the introduction of steam-whalers, and, in some instances, of vessels wintering in Greenland; but, with all these advantages, our whalers barely pay their expenses, and the fishery, as compared with former years, exhibits a considerable falling-off. The total whaling fleet numbered at one time 159 ships, but to-day it barely amounts to a tenth of that number. The seal is now largely captured for the purpose of obtaining its oil, many thousands being annually killed by British sealers, as many as 15,000 being taken by the men of a single ship. See WHALE, CACHOLOT, SEAL, GREENLAND, &c. The South-Sea or sperm-whale fishery is principally in the hands of the Americans, who pursue this branch of commerce most successfully.

The British and Irish sea and salmon fisheries are, so far, regulated by numerous acts of parliament. It is quite impossible, however, to give a *précis* of all the provisions which the legislature have laid down for promoting and protecting our fisheries, they are so numerous, and many of them quite local. The sea-fisheries are, in effect, free to all who choose to fish; but the salmon is, by use and wont, as also by acts of parliament passed at various times, private property, although the owners of fisheries have had to submit them, from time to time, to the regulating power of the legislature.

The following is a summary of the leading points of fishery legislation:

From a very early time, statutes have been passed both in England and Scotland for the purpose of protecting the breeding of fish, and preventing the destruction of the spawn or fry. The development of the fisheries led to a system of advancing public moneys for their encouragement; for this purpose, commissioners were appointed, through whom money was advanced on loan. A treaty was entered into in 1839 between her

Majesty and the late King of the French, and carried into effect by act of parliament, concerning the fisheries in the seas between the British Islands and France. By this convention, the limits within which the general right of fishing is exclusively reserved to the subjects of the two kingdoms respectively, are fixed at three miles' distance from low-water mark. With respect to bays the mouths of which do not exceed ten miles in width, the three-mile distance is measured from a straight line drawn from headland to headland. In 1854, a similar treaty was concluded between her Majesty and the United States of America, relating, *inter alia*, to the rights of fishery between the British colonies in North America and the United States. Fresh fish of British taking, imported in British bottoms, may be landed without report or entry. Persons employed in the fisheries, in such manner and under such circumstances as are laid down in 50 Geo. III. c. 108, are exempted from impressment.

It would be well if the various acts of parliament regulating the fisheries were codified or arranged in some logical sequence; and the various fishery offices might be consolidated under one governing board, instead of being, as at present, scattered over various public departments, or administered in separate offices.

FISHES, Royal—i. e., those which at common law are the property of the crown—are the whale and the sturgeon, when either thrown on shore, or caught near the coast. The ground of the privilege is said to have been the superior value of these fishes. They were considered too precious for a subject, just as the Swan (q. v.), which was a royal bird, was too good for any table but the king's. 'Our ancestors,' says Blackstone, 'seem to have entertained a very high notion of the importance of this right, it being the prerogative of the kings of Denmark and the dukes of Normandy; and from one of these it was probably derived to our princes. It is expressly claimed and allowed in the statute *De Prærogativa Regis* (17 Edw. II. c. 11), and the most ancient treatises of law now extant make mention of it.'—Stephen's *Com.* ii. p. 547. Strictly, it was the head only of the whale which belonged to the king, the tail being a perquisite of the queen-consort (*Ib.* p. 457). In Scotland, whales thrown on shore above six horse-power draught, belong to the queen or her donatary, the admiral. Smaller whales have been claimed both by the landlord and the tenant on whose ground they are cast, but they are usually given to the catcher. In Shetland, where the washing of whales on shore is an occurrence of sufficient frequency to have given rise to a local custom, they are equally divided between the proprietor of the soil and those concerned in catching them. See Salmon.

FISHES (*Pisces*), the fourth—or, according to Milne-Edwards and some other naturalists (see Amphibia), the fifth class of vertebrated animals; consisting of creatures which live in water, and accordingly breathe by gills (*branchiæ*), and not, at any stage of their existence, by lungs. In number—both of individuals and of different kinds—they are supposed to exceed all the other classes of vertebrate animals put together. Even the water of hot springs and the pools of caverns have their peculiar fishes, and some of these are only known as thrown out with torrents of muddy water by volcanoes.

The form of fishes is generally adapted to easy and rapid progression through water, being more or less nearly that of a spindle, swelling in the middle, and tapering towards the extremities; the
outline unangular, and the surface smoot
exceptions to this rule are numerous; an
provided with other means of seeking the
or of preservation from their enemies, exh
greatest possible departures from the ordinary

most of the muscles of the body combine to g
energy to its strokes, great part of the body
with it, and the vertebræ with their proce
so framed as to admit great freedom of lat
scarcely any vertical motion. The pect

fins seem to serve chiefly for balancing the and guiding and staying its motion ; the dorsal al fins, like the keel of a ship, for keeping ts proper position. All the vertical fins are ted by bones which do not join those of the l skeleton, but are thickest at the skin, from they penetrate towards the vertebræ, being sed between the spinous processes of the ral column. Several of the last caudal ræ are generally very short and combined, and terposed spines which support the caudal fin ge towards them. The *rays* of fins are either bones (spines) sometimes prolonged beyond mbrane, and forming defensive weapons or re cartilaginous and jointed, in which case ften also branch near their summit. The fin never has any other than these soft rays, ny fishes have no other in any of their fins. fishes, belonging to different families, have toral fins developed to an unusual degree, so ake them capable of supporting short flights ir (see FLYING FISH and FLYING GURNARD) ; few are capable of employing their fins as of locomotion in a very different way, creeping und, or hopping among the weeds and shore.

heart of fishes consists only of one auricle and ricle, receiving venous blood only, and sending gills, where, being oxygenated, it passes ater or systemic circulation by the dorsal CIRCULATION. In most fishes, there is, heart, a thick *bulb* or muscular swelling artery which conveys the blood from the the gills, and which assists in propelling d, being furnished with valves to prevent ation into the heart ; and this bulb and exhibit varieties admirably characteristic nt natural groups, much founded upon in of Muller and Owen. The blood of , its corpuscles are oval and of consider- , but in general not very numerous. Fishes

Chironectes Caudimaculatus.

ne little oxygen in respiration, and are *cold-* animals, having in general a temperature elevated above that of the water in which ive ; although there are some singular excep- to this rule, as the tunny, sword fish, &c., having a comparatively high temperature, lso redder blood with more numerous cor- . The oxygen appropriated by means of the respiration is not obtained by decomposition ter, but from the air which is mixed in it, nce the necessity of aerating an aquarium ; hence also we perceive one of the benefits resulting from the agitation of the ocean and of lakes by winds. Some fishes require a greater supply of air than they can easily obtain from the water, and frequently come to the surface to breathe. Fishes taken out of the water die from want of breath, in consequence of the drying up of the fine fringes of the gills ; and those which are capable of subsisting longer out of water than others, have generally small gill openings, not so freely admitting the air to dry the gills, whilst a few are provided with receptacles for water to keep them moist. See ANABASIDÆ.

The gills of fishes are situated at the back part of the sides of the head, and consist of a multitude of very vascular membranous plates, which are generally in double fringe-like rows fixed by the base only, and simple, although in a few fishes they are feathery, and in the greater number of *Cartilaginous Fishes* (q. v.), they are fixed both by their external and their internal edges, or consist of mere folds of membrane attached to the surface of the gill-cavities. In general, there are four gills on each side ; the number is greater in some of the Cartilaginous Fishes. In Osseous Fishes, the gill-plates are attached to the external edge of the branchial arches, bony arches connected with the *hyoid bone* or bone of the tongue which is unusually developed in fishes and with the base of the skull, the connection at both ends being effected by intervening small bones, and the whole forming a complicated system ; whilst the cavity containing the gills, on each side of the head, is covered by a bony plate, the gill-lid, gill cover, or *operculum*, with two subordinate pieces, called the *sub-operculum* and *inter-operculum*, articulated on the temporal bone, and playing on the *pre-operculum*, a bony plate placed before them in the head. It is by the motion of these bony plates that the water is expelled which is taken in by the mouth, and which, after passing amongst the gills, and supplying them with air, passes out by the gill orifices at the back of the head. Besides these opercular plates or bones, a series of flattened rays, connecting them with the bone of the tongue, and called the *branchiostegal rays*, aid in forming the gill cavities. In the branchiostegal rays, distinctive characters of fishes are often found.

The brain of fishes differs very considerably from that of other vertebrate animals. See BRAIN. In general, they possess the nerves and organs of all the senses, although the senses of touch and taste are commonly supposed to be more dull than in many other animals ; and a few fishes, living chiefly in mud, or in the waters of caverns, are destitute of eyes, and consequently of sight, although even they possess optic nerves, and seem sensitive to light. But in most of them, the eyes are large, and vision is evidently very acute ; and some have cirri or barbules near the mouth, filaments proceeding from some of the fin-rays, &c., which are regarded as delicate organs of touch, adapted to the wants and habits of the particular species. The eyes are covered by the skin, modified in its character, and have no eyelids nor nictitating membrane. They are very variously placed in different kinds. There is no external ear.

The mouth is the only organ of prehension. It is very different in different kinds—sometimes very small, sometimes extremely large, sometimes forming a sucker by which the fish can both fix itself and pump up the fluids of the animal on which it preys. The snout is also abbreviated, prolonged, or otherwise modified in very various ways. The teeth are far more various in form, number, position, and structure, than in any other class of animals. They never have any roots, but are fixed to the bones which support them; they fall off, however, and are replaced. Some fishes have no teeth; some have very small teeth; some have teeth in great number, but so fine as to resemble the hairs of a brush; some have short thick teeth; some have long sharp teeth, either straight or crooked; some have teeth so flat and closely set that they resemble a regular and beautiful pavement; and the teeth of fishes are sometimes situated not only on the jawbones, but on the *vomer* or bone extending along the middle of the roof of the mouth, and indeed, also, on other parts of the palate to the very throat, and very commonly on the tongue. The food of fishes is various: a few subsist on vegetable food of different kinds, but most of them on animal food, of which there is no kind that does not seem to be particularly agreeable to some of them, from the mere animalcule or the most minute crustacean to the flesh of the mammalia. In general, they are excessively voracious, and seem to spend most of their lives in seeking food. Many of them prey on other fishes, and many seem equally willing to devour other species or the younger and weaker of their own. Some of them swallow their food almost or absolutely alive; others subject it to processes of comminution, trituration, and mastication in the mouth. Salivary glands are not found in fishes, although they exist in some of the invertebrate animals. The digestive process seems to be performed very rapidly. The stomach and intestines vary very much in different kinds. The kidneys are in general extremely large, extending through the whole length of the abdomen.

The *air-bladder* is found in many fishes, but not in all; and is present or absent in different fishes even of the same genus or family. See AIR-BLADDER. Its uses, and its connection with the habits of particular species, have as yet been but partially ascertained.

Fishes are oviparous (egg-producing); a few are ovoviviparous (eggs hatched within the body, and young produced alive). The chief reproductive organs are generally two elongated lobes of a fatty substance, *milt*, in the males, and of rudimentary eggs, *roe*, in the females. Impregnation usually takes place after the *roe* or *spawn* is deposited, the male accompanying the female to the place of spawning. In some Cartilaginous Fishes, it takes place before the deposition of the eggs; and male sharks and rays are furnished with organs called *claspers*, the use of which is well indicated by the name. The fecundity of fishes is generally very great, and their eggs very small in proportion to the size which they ultimately attain, although this is not so much the case in the Cartilaginous Fishes already mentioned. Some of the fishes most valuable to man, as the salmon, herring, and cod, are remarkable for their fecundity. Nine millions of eggs have, according to Leuwenhoek, been ascertained to exist in the roe of a single cod; and provision is thus made both for the preservation of the species amidst all the dangers to which the spawn and the young are exposed, and for the wants of man. The spawn of fishes is deposited in very different situations, according to the different kinds as by some on aquatic plants, by some on beds of sand or gravel; but many species leave the depths of the ocean in order to deposit it in shallower waters, and some, usually marine, ascend rivers for this purpose. Very few fishes take any care of their eggs or young; but there are remarkable exceptions to this rule, and some of the gobies and sticklebacks are known to tend their young with great care. Sticklebacks also construct nests. See STICKLEBACK. It is not long since this curious fact was discovered, although these little fishes have been so long familiarly known; and it is therefore not improbable that many other fishes may have the same habit.

The growth of fishes is very rapid when supplies of food are abundant, but becomes slow in less favourable circumstances, or is arrested for a long time, in a manner to which there seems to be nothing similar among other vertebrate animals.

The skin of fishes is generally covered with Scales (q. v.), which, however, are sometimes minute and imbedded in the skin, and sometimes altogether wanting. The scales are either horny or bony, and are generally imbricated, like the slates of a roof, their free ends backwards; but sometimes form bony plates, fixed by the whole of their lower surface. They usually exhibit beautiful s markings and inequalities of surface kinds, and in some are covered with a k enamel. The differences of character have been made the foundation of a cl fishes by Agassiz, by whom all fishes a into the four orders of *Cycloid*, *Ctenoid*, *Ganoid Fishes* (see these heads), ha tively cycloid, ctenoid, placoid, and gan classification which has been found p convenient with reference to fossil fishes, other systems maintain their ground agai preferable for recent species. It is not, wholly artificial, for a relation can be very traced between the character of the scale general structure and economy of a fish.

The scales of a row extending from the to or towards the tail on each side of the of Osseous fishes in a somewhat waved line the *lateral line*, are pierced for the tr of a slimy matter, with which the wh lubricated.

The colours of fishes depend upon a sub consisting of small polished laminæ, skin.

As fishes need no covering, like fur or fe prevent the dissipation of their animal h surrounding medium, their scales must be chiefly as defensive armour. Some of th defended by large bony plates, which are the head alone or also on the body, and spines connected with the fins, gill-covers, have any other offensive weapons than their but the spine attached to the tail of some remarkable exception, as is also the elonga or beak of the sword-fish, saw-fish, and a few But a much more remarkable kind of probably both offensive and defensive—is by a few fishes, in an electrical apparatus, they can give severe shocks. It is also resting fact, that the electrical apparatus different in different fishes possessing it, t notus or Electric Eel, the Torpedo, and the Silurus or Malapterurus. See ELECTRICITY.

Many fishes are gregarious, swimming i which in some species consist of immen titudes. Some also make periodic salmon, for example, ascending our r herrings and pilchards visiting our coasts, long migration formerly ascribed to these now doubted or disbelieved. The occasion land migrations of eels, and the more overland migrations of some tropical fish but be regarded with peculiar interest; instinct is very wonderful by which, from a pool that is about to be dried up, their course towards a place where w abundant. This faculty is, however possessed by tropical fishes both of western hemispheres; but more destined to inhabit tropical p to be dried up, are capable of living dormant, imbedded in the mud, till they are liberated again by the rains, when they reappear in their former multitudes.

Of the uses of fishes to man, by far the most important is that of supplying him with food. Fishes form an article of food in almost all countries, and in some a principal part of the food of the inhabitants. Many fishes are highly esteemed for the table, which are not procured in sufficient abundance to be a principal part of food in any country. Some fishes, on the contrary, are unpalatable; and some, mostly tropical, are poisonous, whilst others are poisonous only at particular seasons.—The skin of some Cartilaginous Fishes yields SHAGREEN (q. v.), and the air-bladder of some fishes yields ISINGLASS (q. v.). The minute laminæ which e brilliancy of colour to some, and the similar stance found in the air-bladder of others, afford terials of which artificial pearls are made. useful for lamps is obtained from a number hes, and the medicinal value of cod-liver oil well known.

classification of fishes most generally adopted of Cuvier, who divides them into OSSEOUS (having true bones), and CARTILAGINOUS (q. v.); and divides Osseous Fishes into opterous Fishes (*Acanthopterygii*, q. v.), and opterous Fishes (*Malacopterygii*, q. v.). The tem of Agassiz has already been noticed. That ller and Owen differs from both.

al Fishes.—The medium in which fishes live, he hard and almost indestructible nature of portions of their skeletons—as their teeth, s, and scales—would lead us to anticipate their quent occurrence in the Sedimentary rocks; but much as the soft parts of the animal are liable speedy decomposition, the remains of fish must n exist in a fragmentary and scattered con n. Thus, the teeth in the shark, the spine nce in the sting ray, and the scales in the ny, would survive the total destruction of the laginous skeleton as well as the soft portions hese fish, and would alone remain to testify to existence.

earliest ichthyic remains are of this frag- character. They have been obtained from llow rock,' a member of the Upper Silurian s, and consist of spines and portions of skin, have been thickly covered with hard tubercles prickles, like the shagreen of the shark's skin. pines most nearly resemble the dorsal spine dogfish; they are small, flattened, and curved. Along with other similar frag- remains, they have been placed under the t indefinite generic title *Onchus*.

minute, compressed, conical, and glistening dies, called *Conodonts*, obtained in great numbers the Lower Silurian measures in Russia, and ered by their describer, Pander, to have been eth of fishes, belong certainly to very different ls. Their small size and peculiar forms, and atire margin of the hollow base by which were attached, shew them to have been the les from the lingual ribbon of shell-less s, which have left no other traces of their than these remarkable Conodonts.

udlow bone-bed contains the earliest noticed ins. No idea of the numerical importance at this early period can be satisfactorily d; yet these remains being confined to a single bed, and occurring rarely even in that, would to indicate that the Silurian seas were but tenanted by these earliest sharks.

the immediately succeeding Devonian rocks, numbers largely increased. The ichthyodorulites, or fossil spines of this period, have been referred to fourteen different genera. Numerous species of true ganoids have been determined from their well-preserved enamel scales, which occur singly or in confused groups, and frequently also associated with the head, fins, and tail, so as to present a faithful 'nature-print' of the fish upon the rock. See DIPTERUS, DIPLACANTHUS, &c. But the most remarkable and characteristic fossils of this period are the Buckler-fishes, whose head and part of their body were covered with bony plates, giving them so singular and anomalous an appearance, that some of them were originally considered crustacean. They are almost confined to the Old Red Sandstone series, a single species (found in Permian strata) being the only cephalaspid that is known later. See CEPHALASPIS, COCCOSTEUS, PTERICHTHYS, &c.

Fish remains are of frequent occurrence in the Coal-measures. Upwards of twenty species of plagiostomous fishes have been determined from the spine defences, some of which are very large and powerful. The frequency with which the peculiar teeth of the cestracionts are met, shew that they must have been common in the carboniferous seas. Ganoids were also abundant. See PALÆONISCUS, HOLOPTYCHIUS, &c.

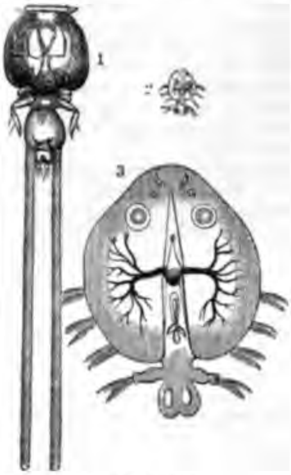
In the Permian period, the forms are similar to what exist in the older strata. Up to the last Permian deposit, the fish have all possessed heterocercal tails; but with the Secondary rocks, the homocercal tail not only appears, but becomes the more frequent form.

Numerous species and many new forms appear in the Trias and Oolite. Sharks are remarkably abundant in the Cretaceous strata; but the Chalk is specially remarkable from containing the earliest discovered remains of the true bone-fishes those covered with ctenoid and cycloid scales.

In the Tertiary strata, the character and proportion of ichthyic remains exhibit a condition in the inhabitants of the water very similar to what at present prevails. The cartilaginous orders decrease, and are replaced by osseous fishes, such as the salmon, cod, turbot, and herring fishes which are of much greater value to man than those they superseded.

FISH-HOOKS. A considerable amount of skill is required for the successful manufacture of these simple articles. There are two kinds in the market, the English and the Limerick fish-hooks, the latter are in the highest repute among anglers. The English fish-hooks are made chiefly at Redditch, in Worcestershire. Steel-wire is cut into the required lengths, and softened; then the ends of three of these are inserted into shallow holes of a sort of rest or standard, and thus supported, the barbs of all three together are cut up by the skilful pressure of a stout knife; they are then pointed, and turned by pressing them against a little ridge of sheet-brass let into a block of wood, and having the requisite curvature. The other end is next flattened out, by laying it on a small anvil, and striking a blow with a hammer. This is done to prevent the silk ligature from slipping over the end. The finer worm-hooks have the shanks filed, in order that the silk dressing may not enlarge the shank so much as to prevent the slipping of the worm over it. They are then hardened, tempered, and blued. The Limerick hooks are made by cutting the steel, which is made from the best malleable iron, into lengths for two hooks. The ends are then forged out to the shape of barb and point, and the barb is undercut *with a file* from the solid forged end, instead of being cut and turned up with a knife. This constitutes the chief superiority of the Limerick hooks. They are shaped to the required curve by grasping them in circular pliers, and bending the wire with a turn of the wrist.

FISH-LOUSE, or **SEA-LOUSE**, names commonly given to the entomostracous crustaceans of the order *Siphonostoma*. All the creatures of this order are of small size, and parasitic on fishes, aquatic batrachians, &c., on the juices of which they live, although they have also the power of swimming freely in the water, some of their legs being adapted to this purpose, and, indeed, they can swim with extreme rapidity, making use of this power to gain that place where they may obtain food at the expense of other creatures. They do not begin life as parasites, the females depositing their numerous eggs on stones, plants, &c. They are animals of singular form and appearance. The genera *Argulus* and *Caligus* are now regarded as the types of two families. In the former, there is a curious sucking disc on each side of the beak or proboscis, although there are also jointed members terminated by prehensile hooks. In the latter, the hooks of the anterior pairs of feet are the principal organs of adhesion to the slippery bodies of the fishes from which food is to be drawn; and the abdomen of the female is furnished with two remarkably long tubes, the functions of which are not perfectly ascertained. The bodies of all of them are transparent, or nearly so. Some of the *Caligidæ* are common on many of the British sea-fishes; *Argulus foliaceus* on fresh-water fishes, and even on tadpoles. Sickly fishes often become the victims of multitudes of these creatures.



Fish-Louse:
1, *Caligus* (female); 2, *Argulus*, natural size; 3, *Argulus*, magnified.

The name fish-louse is sometimes given also to the *Lernæidæ*, but they are very different.

FISHING-FROG. See Angler.

FISHING-TACKLE. See Angling.

FISHPONDS. See Pisciculture.

FISK, or **FISC**, a term often to be found in Scottish law-books. It is derived from the Latin *fiscus*, literally, a wicker-basket, which came ultimately to signify the privy purse of the emperor, as distinguished from the public treasury, which was called *ærarium*. In Scotland, it signifies generally the crown's revenues, to which the movable estate of a person denounced rebel was formerly forfeited. It still gives his name to a very
ant officer, the Procurator Fiscal (q. v.), or
prosecutor in the first instance, by whom all
are prosecuted before sheriffs and other
judges, and whose duty it is to report to
counsel—i. e., to the Lord Advocate, or his de
all cases which, from their aggravated ch
require to be tried by a higher court. See
Prosecutor.

FISSIRO'STRES (Lat. split-beaked), a t
birds, one of the tribes into which the gre
Insessores is divided. It is characterised by
width of gape, and the bill is depressed or
tally flattened, short, and often furnished with
bristles at the angles; the birds of this trib
insectivorous, and generally subsisting by
insects on the wing, to which this structure
is beautifully adapted. The powers of
generally great, but the legs are short
Swallows and goat-suckers are familia
of this order.

FISSURELLIDÆ, a family of gastero
molluscs, of the order *Scutibranchiata*. Th
much resembles that of the limpet family (
lidæ), but has either a hole at the apex, or
at the front margin. The hole at the apex c
terises the genus *Fissurella* (Keyhole Limpets
the slit appears in the genus *Emarginula*.

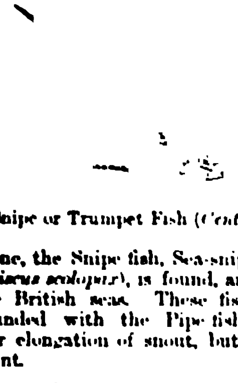
For the cure of salivary or
that is generally necessary is to
of the ducts, which is done by p
along them. Should a fistula, ho
where it is surrounded by mus

orifice of the lower bowel, it is necessary to divide these muscular fibres, so as to leave the part at rest while nature repairs it. As the sinus, which is the continuation inwards of the fistula, is lined with imperfectly organised lymph, it is generally necessary to stimulate the part by the introduction of lint, either alone or saturated with some irritant, such as the sulphate of zinc, which, when mixed in the proportion of 1—3 grains to each ounce of water, and coloured with lavender, makes the famous red lotion of the shops.

At times, however, fistulæ require more elaborate treatment, and are extremely difficult to close, especially those which result from loss of tissue between two adjacent mucous canals; fortunately, however, modern surgery is able to remedy these also. It is necessary to make the edges of the orifice once more raw, and to bring them in contact, but formerly the wound used rarely to unite, as the stitches produced such an amount of irritation. Now, however, by the use of silver or iron wire, according to the taste of the surgeon, the parts can be kept together long enough to insure union; and thus, by the ingenuity of American surgeons, especially Marion Sims of New York, and others this country, certain diseases of women, arising m protracted labours, and formerly rendering the unfortunate subjects of them miserable and unfitted for any of the duties of life, may be now remedied by a skilfully performed, but almost painless proceeding.

FISTULA'RIDÆ, AULOSTO'MIDÆ, or **FLUTEMOUTHS**, a family of acanthopterous s, remarkable for the conformation of the l; the skull being elongated into a tube, at the extremity of which are the mouth and jaws. The species are all marine; they are widely distributed;



Snipe or Trumpet Fish (*Centriscus scolopax*).

one, the Snipe fish, Sea-snipe, or Trumpet-fish *triscus scolopax*), is found, and that very rarely, the British seas. These fishes are not to be unded with the Pipe-fishes, which have a ar elongation of snout, but are otherwise very ent.

FISTU'LINA, a genus of fungi allied to *Boletus* (q. v.); the under surface (*hymenium*) at first covered h minute warts, which ultimately form tubes. *hepatica* is common in Britain and throughout pe on old oak, walnut, and chestnut trees; ccurs also on ash and beech. It is semicircular, very regular outline, with a lateral stem, or ne; its colour red; its substance fibrous and hy, much resembling beet root. When old and ning to decay, it looks like a mass of liver. I ometimes attains a great size. Dr Badham describes a specimen nearly five feet round, and weighing eight pounds. Mr Berkeley mentions one which grew on an ash pollard, and weighed nearly rty pounds. This fungus is much esteemed in e parts of Europe as an esculent; it is wholee and nutritious; and the abundance in which may often be procured, makes it the more worthy regard; whilst there is almost no possibility of confounding it with any dangerous fungus. Its taste resembles that of the common mushroom, but

Fistulina Hepatica.

is rather more acid. 'When grilled, it is scarcely to be distinguished from broiled meat.' It furnishes itself with abundance of sauce.

FITCHET. See POLECAT.

FITCHY, or FITCHÉ. Crosses are said, in Heraldry, to be fitchy when the lower branch ends in a sharp point. Crosses are supposed to have been so sharpened to enable the primitive Christians to stick them into the ground for devotional purposes.

FITS, a name popularly applied to Convulsions (q. v.), or, indeed, to any sudden seizure of disease implying loss of consciousness, or any considerable change in the condition of the mind.

FITZ is an old Norman word signifying 'son,' evidently from the Lat. *filius* (Fr. *fils*). Like the Scotch *Mac*, the Irish *O'*, and the Oriental *Ben*, it is prefixed to proper names to signify descent, as in the Norman names Fitzwilliam, Fitzwalter, Fitzgerald. A later application of it has been to denote the natural sons of royalty, as in Fitzroy, Fitzjames, and Fitzclarence. The Russian termination *witch* is a disguised form of the same word.

FIU'ME (in the Illyrian language, *Reka* or *Rika*; Latin, *Fanum St Viti ad flumen*), an important seaport of Austria, is situated at the efflux of the Fiumara into the Gulf of Quarnero, in the Adriatic, 40 miles south-east of Trieste, across the Istrian peninsula, in lat. 45° 20′ N., and long. 14° 26′ E. F. has quite the character of a German town, is adorned with many handsome buildings, and consists of an old and new town, which together contain about 14,000 inhabitants. It has manufactures of tobacco, rosoglio, wax, paper, chemicals, and a flourishing trade in ship-building. F. has a fine freestone quay, with a light-house, but has little commerce. It has been a free port since 1722; and in 1849 was severed from Hungary with the territory to which it belongs, and now forms a portion of the Austrian crownland of Croatia.

FIVES, a popular game in England, and one especially enjoyed by school-boys, and in certain barracks where there is a 'court,' by soldiers. The game existed at a very early period—14th c.—both in France and England, being termed 'palm play' in the former, and 'hand-tennis' in the latter; its present name is derived from its being played usually by five on each side. The method of playing the game is very simple: a good roomy court is requisite, bounded by a high wall at one end, and against this wall a ball is propelled by striking it with the open hand. The players arrange themselves either five against five, as is usually the case, or in fewer numbers, and begin the game by one member striking the ball against the wall, and causing it to rebound anywhere beyond the floor-score, which is about two yards from the wall; one of the opposite party then strikes the ball as it rebounds, and if it does not touch the wall higher than three feet from the ground, his stroke goes for nothing, and the opposite party score one. The ball may be struck either from a direct rebound before it reaches the ground, or after it has 'dapped' or hopped from the ground once. Fifteen is usually game. When the players are skilful, the ball is kept going by the alternate strikers for many minutes at a time, and the game is thus rendered exciting both for players and onlookers.

FIXED AIR was the name given to Carbonic Acid (q. v.) by Dr Black, who was the first to observe that the solid substance, carbonate of magnesia (MgO,CO_2), could, when heated, evolve carbonic acid (CO_2), proving that the latter was a *fixed air* whilst in union with the magnesia.

FIXED BODIES is a term applied in chemistry to those substances which remain fixed, and are not volatilised at moderately high temperatures.

FIXED OILS are those oils which, on the application of heat, do not volatilise without decomposition. See OILS.

FIXED STARS. See STARS.

FIXING, in Photography. When a picture has been obtained through the agency of light, by the exposure of a sensitive surface suitably prepared, and the subsequent development of the latent image, there remains in the deepest shadows of the picture a portion of the sensitive material, unacted upon by light. The removal of this unaltered sensitive material by an appropriate solvent, is termed fixing, though the term *clearing* would perhaps be preferable, fixing being more strictly accurate in the case of the Daguerreotype process (q. v.), where the picture is literally *fixed* to the silver-plate by the deposition of a film of metallic gold, of extreme tenuity, from a boiling hot solution of Sel D'or (q. v.).

For particulars of failures arising from imperfect fixation or clearing, see PHOTOGRAPHY.

FIXTURES, in the Law of England, are those personal chattels (q. v.) which are let into the soil, or otherwise actually affixed to the freehold; a definition which is sufficiently accurate to afford a principle for the solution of the questions which arise between landlord and tenant as to the right of the former to retain, or of the latter to remove—but a principle, the application of which is attended with many practical difficulties. If the chattels be entirely clear of the soil, they are not fixtures at all, and may be carried off at pleasure like any other species of personal property. The general rule as to what constitutes a fixture legally immovable is, that it must be either let into the earth, or cemented or otherwise united to some erection previously attached to the ground, so that it would be waste to remove it afterwards (Woodfall, pp. 466, 467). But it must be remarked, that a tenant may in all cases construct any erection he may make in such a manner as that it shall not become a fixture. Thus, if he even erect buildings—as barns, granaries, sheds, and mills—upon blocks, rollers, pattens, pillars, or plates, resting on brickwork, they may be removed, although they have sunk into the ground by their own weight (*Ib.* 467). To this rule various exceptions have been made in favour of what have been called *trade fixtures*, or fixtures put up for the purpose of carrying on a trade; and the statute mentioned below has greatly modified the law as to those erected for agricultural purposes. It is difficult to state the limits of the exception with reference to trade fixtures with any approach to accuracy. The following is perhaps as near an approach as the

varying circumstances of each individual
admit of. 'Whenever the following circ
occur, it may be confidently pronounced
the tenant may safely remove the artic
things which the tenant has fixed to th

3d edition). In Scotland, it has been c
agricultural leases more particularly, t
the respective rights of landlord and
positive stipulation, and, for this rea
points have been decided by the courts
England.

As regards urban tenements, the rule
that the tenant may remove whatever h
up for ornament or domestic use—e. g.,

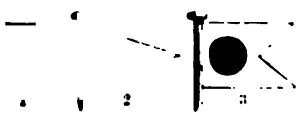
stoves, &c., but not such erections as have of the tenement, and constitute per- ovements. Thus, he cannot remove a fixed to and communicating with dwelling-house by windows and doors.

CCUS, C. VALERIUS, a Roman poet, who d in the 1st c., and is supposed to have died bsolutely nothing is known regarding is the author of an epic poem on the expedition, which in its extant form is Some modern critics, Wagner among raise it extravagantly, and place the author Virgil; but the more general opinion of holars is, that the work is rather a specimen d mediocrity than of genuine inspiration. *princeps* of the *Argonautica* appeared in modern editions, may be mentioned those er (Gött. 1805) and Lemaire (Paris, 1824). ish metrical translation was published by holas Whyte as early as 1565. Similar ns exist in French, Italian, and German.

OURTIACEÆ, a natural order of exo- lants, allied to Passion-flowers, consisting and small trees, almost exclusively con- the warmest parts of the globe. Many of particularly of the genus *Flacourtia*, ant, sweet, or subacid fruits. *Fla- mis* is much esteemed and cultivated uccas. Arnotto (q. v.) is produced by a order.

, a popular name for many endogenous th sword-shaped leaves, mostly growing in ations. It is sometimes particularly appro- o the species of *Iris* (q. v.), or Flower- but is given also very indiscriminately lants of similar foliage, as the *Acorus* e ACORUS), which is called Sweet Flag.

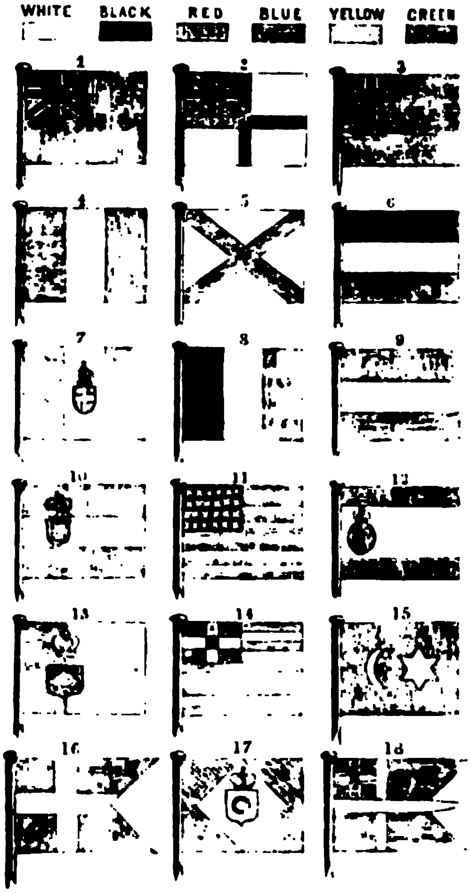
(common to the Teutonic languages, and rom a root signifying to fly), a cloth of terial, capable of being extended by the designed to make known some fact or ectators. In the army, a flag is the d as its distinguishing mark by each and also a small banner, with which the be occupied is marked out. In the navy, is of more importance, often constituting means vessels have of communicating h other, or with the shore. For this devices of conspicuous colours (usually e, red, yellow, or blue) are hoisted at ead or at the gaff. The flags having -viz.



uare Flag; 2, the Pennant; 3, the Burgee;

w patterns in each shape give sufficient ons of three or four flags to express any word in the language. The flag is also a e rank of the principal person on board a the 'Royal Standard,' containing the United Kingdom, which is only hoisted mber of the royal family is on board; of Hope, on a red ground, denoting y; the pennant, which specifies the , and the ensign, which denotes the

signs borne by ships-of-war of the leading states of the world are as shewn below (in these diagrams, the direction of the lines shews the colour, as in heraldry), viz.:



Flags of the Principal Maritime Nations:

1, Britain, red ensign; 2, Britain, white ensign; 3, Britain, blue ensign; 4, France; 5, Russia; 6, Germany; 7, Italy; 8, Belgium; 9, Holland; 10, Austro-Hungary; 11, United States; 12, Spain doubtful, 1873; 13, Portugal; 14, Greece; 15, Turkey; 16, Denmark; 17, Brazil; 18, Sweden.

A white flag is accepted throughout the world as a token of peace; a red flag, as defiance; and a black flag denotes a pirate; a flag of plain yellow usually signifies that the vessel bearing it is in quarantine. See also UNION JACK.

FLAG OF THE PROPHET (Sanjak-Sherif) is the sacred banner of the Mohammedans. It was originally of a white colour, and was composed of the turban of the Koreish, captured by Mohammed. A black flag was, however, soon substituted in its place, consisting of the curtain that hung before the door of Ayeshah, one of the Prophet's wives. This flag, regarded by the Mohammedans as their most sacred relic, first came into the possession of the followers of Omar at Damascus; it afterwards fell into the hands of the Abbasi; then passed into those of the califs of Bagdad and Kahira; and, at a later period, was brought into Europe by Amurath III. It was covered with forty-two wrappings of silk, deposited in a costly casket, and preserved in a chapel in the interior of the seraglio, where it is guarded by several emirs, with constant prayers.

The banner unfolded at the commencement of a war, and likewise carefully preserved, is not the same, although it is believed by the people to be so.

FLAG-CAPTAIN, in the Navy, is the captain of the admiral's ship in any squadron, and is ordinarily his nominee.

FLAG-LIEUTE'NANT is an officer who, in the navy, performs such duties for an admiral as would devolve upon an aide-de-camp in the army. He communicates the admiral's orders to the various ships, either personally or by signal.

FLAG-OFFICER, in the British Navy, is an admiral, vice-admiral, or rear-admiral. He is so called from his right to carry, at the mast-head of the ship in which he sails, a flag denoting his rank. For an admiral, the flag is borne at the main; for a vice-admiral, at the fore; and for a rear-admiral, at the mizzen: the flag being, in either case, a red cross on a white ground. For the former division by squadrons, see ADMIRAL.

FLAG-SHIP, the ship in a fleet which bears the admiral's flag, and therefore forms a sort of centre to which all other vessels must look for orders. It is usually the largest vessel in the fleet.

FLA'GELLANTS, the name given to certain bodies of fanatical enthusiasts, who, at various intervals from the 13th to the 16th c., made their appearance in the different countries of Europe, proclaiming the wrath of God against the corruption of the times, inviting sinners to atone for sin by self-inflicted scourgings or flagellations, and themselves publicly enforcing this exhortation by voluntary scourging of themselves, and by other forms of self-castigation. In large and disorderly bands—frequently headed by priests, and by fanatics in the costume of priests and monks, bearing banners and crucifixes aloft, their breast and shoulders bare, and their face concealed by a hood or mask, each armed with a heavy knotted scourge, loaded with lead or iron - they marched from town to town, chanting hymns full of denunciations of vengeance and of woe. In the most public place of each town which they entered, they threw themselves upon the earth, with their arms extended in the form of a cross, and there inflicted upon themselves the discipline of scourging, frequently to blood, and even to mutilation. Each member enrolled himself for 33 days, in honour of the 33 years of the life of our Lord on earth; and all for the time professed entire poverty, subsisting only on alms or voluntary offerings. These fanatical movements, resembling, in some respects, at least, the religious revivals of our own time, recurred at frequent intervals. The most remarkable, however, are three in number. The first originated at Perugia in 1260, at a time when society in Italy was greatly disorganised by the long continued struggles of the Guelph and Ghibelline factions. The very disorders of the time prepared the way for this religious reaction. Numbers crowded to follow the new cry, until at last the body became so formidable as to draw upon itself the suspicions of Manfred, the son of Frederic II., by whom it was vigorously suppressed. Later offshoots of the party made their appearance in Bavaria, Austria, Moravia, Bohemia, Poland, and France; when to their extravagant practices, they added still greater extravagances of doctrine. In virtue of a pretended revelation, they asserted that the blood shed in self flagellation had a share with the blood of our Lord in atoning for sin; they mutually confessed and absolved each other, and declared their voluntary penances to be a substitute for all the sacraments of the church, and for all the ministrations of the clergy. The Jews were to them an object of special abhorrence; and this un
race, exposed at all times to every capri
popular will, suffered dreadfully from the
the Flagellants in many of the towns of
and the Netherlands. In the second out
Flagellantism about 1349, the outrages
public decency were much more flagrant
its first appearance. Men and women in
nately now appeared in public half na
ostentatiously underwent these self-inflict
ings. The immediate occasion of this new
of fanaticism, was the terror which pervade

the string down to the finger-board.

vibrates on both sides of the finger, the long side dividing itself into parts of the same length as the short side. See HARMONICS. The inventor of the manner of playing flageolet-tones is said to have been Domenico Ferrari. The best work on the subject is by Colinet.

FLA'GSTONE, a rock which splits into tabular masses, or flags of various size and thickness, in the original plains of stratification. Flagstones are generally sandstones, combined with more or less argillaceous or calcareous matter: some, however, are indurated clays, and others thin-bedded limestones. They are used for paving, cisterns, &c. The most famous are those of Festiniog (North Wales), remarkable for their large size, even grain, and great beauty; those of Yorkshire, also of large size, and of great hardness and toughness; and those of Caithness, which are extremely tough and able. The Caithness flags belong to the Old d Sandstone; the Yorkshire are taken from the lstone grit division of the Coal Measures.

FLA'MBOROUGH HEAD (Saxon, *Fleam-* [illegible]), a promontory of the Yorkshire coast, and ng the northern boundary of Bridlington y. It terminates a range of white perpen- ular chalk cliffs, 6 miles long, and 300 to 450 high. Its rugged sides contain many caverns, in the sea near are picturesque chalk rocks, ich swarm with sea-birds. The chalk contains il sponges, crinoids, &c. On the Head is a light- ase, 214 feet high, seen 19 miles off, and in lat. 7 N., and long. 0° 5' E. Across the peninsula, ding in the Head, runs a ditch, with two lines of nce and breast works, called Dane's Dyke, but lly an ancient British work.

AMBOY'ANT, the latest style of Gothic ecture which prevailed in France. It prevailed during the 15th and part of the 16th cen- and corresponds to the Perpendicular (q. v.) land. The name is derived from the flame- rms of the tracery of the windows, panels, (fig. 1). The characteristics of this style are ute and elaborate ornament, combined with ral bareness of surface. The crockets, for nce, are generally cut into a great number of leaves, while they are placed far apart: the ldings are divided into large empty hollows, and small thin fillets and beads; the finials have crockets minutely carved, set upon bare pyramidal terminals; the arch-mouldings are divided into a great number of small parts, and want the boldness and decision of the earlier styles. These mouldings are frequently abutted on the pillars, or continued down them without any caps; and when there are caps, they are small and without effect. See fig. 2. When mouldings join, they are frequently run through one another, so as to appear to interlace. The effect is intricate rather than beautiful, suggestive, like the rest of the style, of ingenuity in stone-cutting rather than art. The doorways and windows are sometimes large and fine (as in fig. 1); but while these are highly enriched, the general surface of the building is left too plain. There are many large buildings in France executed in this style, but it is usually portions only which are fine, not the general effect. Some of the spires of this period are also very beautiful. The north spire of Chartres Cathedral, for example, is considered one of the finest in France.

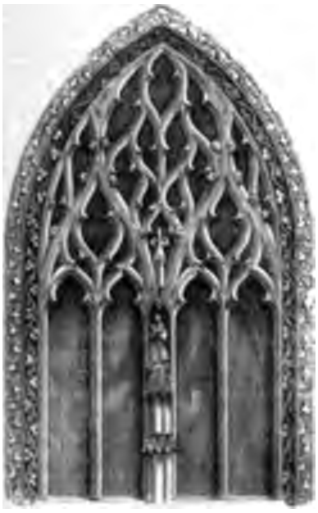

Fig. 1. Window, Harfleur.

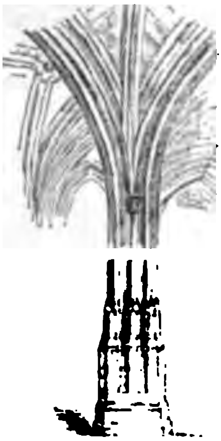

Fig. 2.

FLAME is a particular form of Combustion (q. v.) or burning. Ordinary combustion consists in the oxygen of the atmosphere combining with some combustible substance so rapidly as to give out light and heat. When the combustible is either originally a gas, or becomes so by the heat, the combustion takes the form of flame. Flame, then, is the burning of a gas. In most cases, the gas of flame is a compound of hydrogen and carbon, with minute particles of solid carbon suspended in it, and is formed from the fuel (coal, tallow, &c.) being decomposed by the heat. The heat and light of flame vary with the gas: hydrogen produces great heat, but little light. The lighting power of a gas depends upon the proportion of carbon it contains, the particles of which become glowing hot before being consumed.

The flame of a lamp or candle, or simple gas-jet, consists of a hollow cone, in the centre of which there is no combustion. The central space appears dark only by contrast with the luminous cone which surrounds it. It consists, in reality, of transparent invisible compounds of carbon and hydrogen, which are constantly rising in vapour from the wick. If a glass tube, open at both ends, be held obliquely in the flame of a candle, with its lower extremity in the dark central space above the wick, it will conduct away a portion of the combustible vapour, which may be kindled like a gas-jet at its upper end, as represented in fig. 1. This dark portion of the flame may be called *the area of no combustion*.

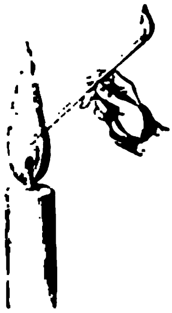

Fig. 1.

The luminous cone which envelops the dark space is *the area of partial combustion*. The oxygen of the atmosphere penetrates to this depth, but not in sufficient quantity to oxidise or burn both the carbon and the hydrogen; it therefore unites with the hydrogen, for which it has the stronger attraction, and leaves the carbon free. The outer cone is named *the area of complete combustion*, because there the carbon meets with sufficient oxygen to burn it entirely. The light is produced in the area of partial combustion, where the carbon is set free from the hydrogen in the form of solid particles, and is heated to whiteness by the combustion of the hydrogen. The combustion of the carbon in the outer cone, by which it is converted into carbonic acid gas, produces heat, but so little light as to be barely traceable.

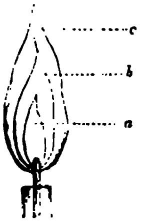

Fig. 2.

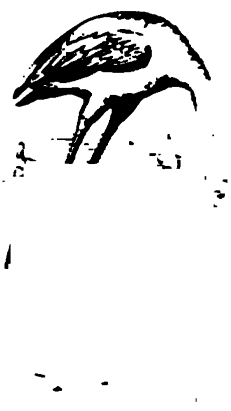
a, area of no combustion; *b*, area of partial combustion; *c*, area of complete combustion.

That carbon exists in a solid state in the white part of a flame, is readily shewn by holding a piece of white earthen-ware into it, which becomes coated with carbon in the form of soot. No soot is deposited in the dark or no-combustion area of the flame, because there the carbon is in chemical combination with hydrogen, forming a gas. The carbon becomes solid only when the hydrogen deserts it, as it were, to unite with oxygen. The highly illuminating power of compounds of hydrogen and carbon is thus traced to the fact, that *their hydrogen and carbon do not burn simultaneously, but successively, and in such a way that the one heats the other white hot.* It is quite possible to make them burn simultaneously; but when they do, the light evolved is very feeble. This takes place in the 'Bunsen burner,' in which air is allowed to mix with the gas before combustion.

FLA'MENS were priests in ancient Rome devoted each to some special deity. There were fifteen in all. The chief of these (*Flamines Majores*) were the flamens of Jupiter, of Mars, and of Quirinus, who were always patricians; the remaining twelve (*Flamines Minores*) were chosen from the plebeians. The flamens were elected at first by the *Comitia Curiata*, but afterwards by the *Comitia Tributa*, and were installed into their office by the supreme dignitary of the Roman pagan religion, the *Pontifex Maximus*. The flamen of Jupiter was a privileged person; he was not required to take an oath, was attended by a lictor, his house was an asylum, and he had a seat in the senate. But all this was attended by numerous superstitious restrictions: he might not have a knot on any part of his attire, nor touch flour, or leaven, or leavened bread; he might not touch or name a dog, or mount a horse, or be a night out of the city, &c. His wife, called Flaminica, was subjected to similar restrictions, and when she died, the flamen was obliged to resign. The majority of Roman writers attribute the institution of flamens to Numa.

FLAMI'NGO (*Phœnicopterus*), a genus of birds which until recently was placed by all naturalists among the *Grallatores* (Waders), but is now generally ranked among the *Palmipedes*, and even referred to the family of *Anatidæ*. The bill is large, deeper than broad, and suddenly curved downwards near the middle, so that, as the bird wades and seeks its food, either in the water or in the mud, it makes use of the bill in a reversed position, the upper mandible being lowest. The edges of both mandibles are furnished with small and very fine transverse laminæ, which serve, like those in the bills of the ordinary *Anatidæ*, to prevent the escape
of the small crustaceans, molluscs, worms,
fishes, seeds, &c., which are the F.'s foo
to separate them from the mud with
may be mingled. The upper surface of
is also furnished on both sides and at th
numerous small flexible horny spines, dire
wards. Unlike the ordinary *Anatidæ*,
have great part of the tibia, as well as
naked, in this resembling all the Waders.
birds of powerful wing, and fly either in strings or in wedge-shaped flocks like geese, a single bird leading the way for the flock. They seldom make use of their webbed feet for swimming, to which the length of their legs is not well adapted, the use of the membrane being rather to support them on soft muddy bottoms. When feeding, they keep their feet in almost constant motion, as if to stir the mud. Hundreds may some-
times be seen feeding together in the
waters or salt marshes of tropical coasts,
of Asia and Africa, or on the banks of ri
inland lakes, and by their large size and rich
making a brilliant spectacle. They
nests in marshes, scraping together a h
on the top of which is the nest; an
that the long legs of the female F. often
into the water during the incubation,
easily disposed of otherwise.—There
species of F., but very similar to each
appearance and habits. One species oc
south of Europe, the Common F. (*P. ru*
measuring fully four feet from the tip
to that of the tail, and six feet from the ti-
bill to the claws; the male, when in full
is of a rose-red colour, with deep purpl-
the female, and the young for several years
brilliant, the young at first being whitish
red first appearing on the wings.—The
F. (*P. Americanus* or *Chilensis*) is of a more
tint, and is abundant on many parts both
eastern and western coasts of America.



Flamingo (*Phœnico*

FLAMI'NIAN WAY (*Via Flaminia*),
northern road of ancient Italy, leading fr-
to Ariminum (*Rimini*) on the Adriatic.
constructed by C. Flaminius during his co-
(220 B. C.), and was designed to secure a f-
munication with the recently conquered
territory. The F. W. was one of the
brated and most frequented roads of
during the period of the Republic
Empire. Its importance may be c
the fact, that when Augustus (27 B. C.
persons of consular dignity road-surve
other highways of his dominions, he
care of the F. W. for himself, and
throughout its whole length. Its gen
was northerly. Leaving Rome, it kept
part at no great distance from the

north-easterly direction, passing In
and Spoletium (*Spoleto*), and reach
the Apennines, at Forum Flaminii
central ridge of the Apennines, at Ad

Schieggia ?), it again proceeded in a northerly direction, pursuing much the same line of route as the modern road from Foligno to Fano, and reached the Adriatic at Fanum Fortunæ (Fano), whence it wound along the coast to Ariminum (Rimini), where it ended, or rather where the name ceased; for the Via Æmilia (see EMILIAN PROVINCES) was just a continuation of it. The whole length of the road from Rome to Ariminum was (according to the Jerusalem Itinerary), 222 miles, and according to the Antonine, 210 miles. Remains of it still exist at various places, and assist the antiquary in tracing its direction.

FLAMSTEED, JOHN, the first astronomer-royal of England, for whose use the Royal Observatory at Greenwich (called Flamsteed House) was built, was born near Derby, 19th August 1646, and early devoted himself to mathematical and astronomical pursuits. While yet a youth, he mastered the theory of the calculation of eclipses; and his calculations of some remarkable eclipses of the moon were means of introducing him to the notice of the at scientific men of his time, among others to nas Moore, then Surveyor-general of the Ord-a. through whom, and in connection with whose nt, he was appointed astronomer to the in 1675. The year following, the Observatory eenwich was built, and F. began that series of ations that constitute the commencement of n practical astronomy. He formed the first rorthy catalogue of the fixed stars, and fured those lunar observations on which Newton ended for the verification of his lunar theory. cts from the papers of F., found in the Obsery by Mr Francis Baily, and published by rity of the Admiralty in 1835, brought to light sharp quarrel that had taken place between Newton and Halley with regard to the publin of the results of F.'s labours. The *Historia stis Britannica*, his great work, in three vols., ing an account of the methods and results of nomical observation up to his time, was begun printed before his death in 1719, but was not lished till 1725. It may be mentioned that F., le following his scientific pursuits, qualified elf for holy orders, and in 1684 was presented to living of Burslow, in Surrey, which he held till leath.

FLANCHES, or **FLANQUES**, in Heraldry, are posed of arched lines drawn from the upper s of the escutcheon to the base points. The s of the flanches almost meet in the centre of shield. The Flanches are an ordinary little used otch heraldry.

FLANCONNADE, a thrust in Fencing (q. v.).

FLANDERS was formerly the name of an ive and almost independent territory ruled counts,' and embracing, besides the present rian provinces of the same name, the southern n of the province of Zealand in Holland, and of the departments in the north-east of nce. Cæsar found this district inhabited by the ini, the Menapii, and the Nervii, and having quered these tribes, he annexed the country. Under the rule of the Franks, the river Scheldt, which flowed through the district, formed the boundary line between Neustria and Austrasia, in consequence of which the northern and south-western part of the territory comprised under the term F., although its population was decidedly Germanic, came to belong to France, while the south-east, although to a large extent non-Germanic, was after 1007 included in the German Empire. F. obtained its name from the *Vlandergau* (*pagus Flandrensis*, the district around Bruges and Sluis), whose counts had been made wardens of the north-eastern coasts of France at the period of the incursions of the Normans, in the latter half of the 9th c., and who extended the name of their hereditary possessions to the whole district which they governed. The first count or markgraf of the country is said to have been Baldwin, surnamed *Bras de Fer* (Iron-Arm), who married Judith, the daughter of King Charles the Bald of France, and widow of Ethelwulf, king of England, and afterwards received the newly created 'mark' or county, in 864, as a hereditary fief from his father-in-law. He extended his territories by the addition of Artois, which was held by his successors until Philippe Auguste reunited it to France. He died in 879, but not until he had inaugurated the industrial greatness of F. by introducing into it a great number of workmen skilled in the manufacture of woollen and other goods. Baldwin IV., or the Bearded, one of the successors of Baldwin *Bras de Fer*, received in fief from the Emperor Henry II. the burgraviate of Ghent, Walcheren, and the islands of Zealand, and thus became a prince of the German empire. He was succeeded by his son Baldwin V., or the Pious (1036—1067), who increased his possessions by the addition of the German territory between the Scheldt and the Dender, belonging to the duchy of Lower Lorraine. To this he added Tournay, the supremacy over the bishopric of Cambray (to which, till the erection of the new bishopric of Arras, the county of Flanders had been ecclesiastically subordinate), and the county of Hainault. During the Middle Ages, F. figured prominently in the political affairs of Europe—the counts of F. being more powerful and wealthy than many European kings. Baldwin IX., the founder of the Latin kingdom at Constantinople, died in 1206, leaving two daughters, one of whom died without children; the other bequeathed Hainault to John of Avennes, her son by her first marriage; and F. to Guy Dampierre, her son by a second marriage. Meanwhile, the industrial prosperity of the cities of F. had become so great, that the citizens began to feel their own power, and to claim independence. They formed republican communities like the free cities of Germany, with this difference, that they admitted the nominal suzerainty of the counts. But they were not afraid to take up arms in defence of their liberties against their nominal masters. Witness the insurrection headed by Jakob van Artevelde (q. v.) against the cruel government of Count Louis I. On the marriage of Marguerite, the daughter and heiress of Louis II., Count of Flanders, to Philip the Bold of Burgundy, the country was united to the Burgundian territories in 1384, and afterwards shared the fortunes of that duchy. The dukes of Burgundy brought great part of the former duchy of Lower Lorraine under their dominion, and thus laid the foundation for the subsequent union of the states of the Netherlands, in which F. continued to form one main component part. On the death of Charles the Bold, these territories passed, in 1477, to the House of Hapsburg, by the marriage of his daughter Mary to the Archduke Maximilian. After Burgundy had passed with King Philip II. to the Spanish line of the House of Hapsburg, the territory of F. was considerably diminished, as not only was the portion called Dutch Flanders transferred to the Estates-general by the peace of Westphalia, but, in the time of Louis XIV., France seized upon another portion of F., as also a part of Hainault, Cambray, and Artois, and was confirmed in her possession by the peace of Aix-la-Chapelle, of Nimeguen, and of Utrecht. By the last, and by the treaty of peace concluded at Rastadt, the remains of the Spanish Netherlands again fell into the hands of the House of Austria. In 1794, F., like the other provinces of Belgium, was incorporated with the French Republic, and afterwards with the Empire, and formed the departments of Lys and Escaut; the Congress of Vienna, however, conferred these portions on the new kingdom of the Netherlands, with which they remained united till the formation of the kingdom of Belgium (q. v.). The Belgian portion of F. is now divided into the provinces of East and West Flanders (q. v.).—Compare Praet, *Histoire des Comtes de Flandres, et de l'Origine des Communes Flamandes* (Brussels, 1828); Le Glay, *Histoire des Comtes de Flandres jusqu'à l'Avènement des Ducs de Bourgogne* (2 vols., Paris, 1843); Kervyn van Lettenhoven, *Histoire de Flandres* (6 vols., Brussels, 1847—1851), &c.

FLANDERS, East, a province in the north-west of Belgium, is bounded on the E. by the provinces of Antwerp and Brabant, on the S. by that of Hainault, on the W. by that of West Flanders, and on the N. by the Dutch province of Zealand. It has an area of 1146 square miles, and a population which amounted in 1870 to 837,726, or about 700 a square mile. East F. is the most populous province of the most populous country in Europe. See Belgium. It is watered mainly by the Scheldt, and by its affluents the Lys and the Dender. The surface is low and level. The soil has been rendered extremely fertile by means of spade cultivation and an excellent manuring system. Besides the ordinary varieties of grain, potatoes, flax, hemp, and hops are produced in great quantity. The district in the north-east of the province, between the towns of Antwerp and Ghent, is celebrated as a flax-growing quarter. The manufactures are chiefly lace, damasks, linens, woollens, bobbin-net, silk, and cordage; sugar-refining, brewing, and distilling are also carried on. Chief towns, Ghent, Alost, and Dendermonde.

FLANDERS, West, the most western province of Belgium, is bounded on the N. by the North Sea, and on the W. and S. by France. Its area is 1237 square miles, and its population in 1870 amounted to 668,976. Its chief rivers are the Lys and the Iser; but it is watered by numerous smaller streams, and is intersected by many important canals. Its surface is flat, with sandy hills in the south and along the coast; and its soil sandy, but well cultivated and productive. It has fewer products and manufactures than East Flanders. Chief towns, Bruges, Courtrai, and Ostend.

FLANGE, a rim or projection upon a tube or cylinder of metal or other material, to serve as a bearing, or afford means of fixing it; for example, the projecting rim on the tires of the wheels of railway-carriages is called a flange.

FLANK (the side), a word used in many senses in military matters. *Flanks of an army* are the wings, or bodies of men on the right and left extremities, prepared to close in upon an enemy who shall attack the centre. *Flank files* are the soldiers marching on the extreme right and left of a company or any other body of troops. *Flank company* is the company on the right or left when a battalion is in line; the grenadier and light infantry companies usually occupy these positions, and are known as flank companies, whether with the remainder of the regiment or not. A *flanking party* is a body of horse or foot employed in hanging upon and harassing the flank of an enemy's force.—Flank, as applied in Fortification, will be best described under that article (q. v.). The *flanks of a frontier* are certain salient points in a national boundary, strong by nature and art, and ordinarily projecting somewhat beyond the general line. The effect of these flanks is to protect the whole frontier against an enemy, as h not penetrate between them, with the risk garrisons, reinforced from their own ter attacking his rear, and cutting off commu between him and his base. Silistria and were flanks of the Turkish frontier durin Pasha's campaign in 1853 and 1854. S in the event of an invasion of England fr coast of Sussex or Kent, Portsmouth and would be formidable flanking garrisons would almost necessarily have to be subdue the invader could march on London.

In evolutions, 'to flank' is to take such tion with troops as either to aid one's own an attack on the enemy, by leading the suppose that his flanks are in danger in his position, or to prevent him from advancing comrades by threatening his flanks if he sh so. To *outflank* is to succeed by manœuvres manding the flank of an enemy who has bee part, endeavouring to flank one's own force.

FLANNEL (Welsh, *gwlanen*, from *gwla* allied to Lat. *lana*), a woollen fabric, differi broadcloth and most other woollen fabrics woven of yarn more loosely twisted, and hav dressing. The best flannel is made in the bourhood of Welshpool and Newtown, in from the wool of the Welsh mountain-she is commercially known as Welsh flannel. quantities are also made in West Lancashi Yorkshire, and the neighbourhood of Le more closely spun and woven flannel, cricketing and rowing shirts, &c., and d printed with various colours and patter in the west of England cloth-making dis vicinity of Stroud, in Gloucestershire. flannel of this kind is made in France and some of this is twilled, and approaches quality to French merinoes, but is much The demand for this sort of fancy-shirting has of late become considerable, and has le production of many varieties, which, tho the name of flannel, vary so materially original Welsh flannel, that they can sc included with them under any general Coarse flannel, called *Galwaye*, is made in and is chiefly used by the peasantry of the

FLAT, a musical character, shaped thus ♭ when placed before a note, lowers that no tone. When placed at the beginning of a music, it denotes that all the notes on the space on which it is placed, with their octav and below, are to be played flat.

FLAT-FISH, a popular name of the family *Pleuronectidæ* (q. v.), as the flou sole, turbot, halibut, &c.: which have much compressed, and the sides une swimming on one side. It is sometimes its signification so as to include skates fishes of the Ray (q. v.) family, which different, being cartilaginous fishes, quite trical, and swimming on the belly, altho the *Pleuronectidæ*, generally keeping clo bottom. It is never applied to the much symmetrical fishes, such as the dory, wh in the ordinary posture of fishes, the d upwards, the ventral downwards.

FLATTERY, Cape, a headland of Was territory, on the Pacific coast of the United marks the south side of the entrance of the of Juan de Fuca. It is in lat. 48° 24′ N. long. 124° 40′ W.—Another headland of th name is found on the east coast of Austral 14° 52′ S., and long. 145° 20′ E. It is about to the north of Endeavour Bay.

.ATULENCE, distention of the stomach or ls by the gases formed during digestion. See ESTION.

.AVINE, or FLAVIN, is a yellow colouring r employed in dyeing, and imported in the tion of extract. It is understood to be the ring matter of bark (quercitron bark), and is in place of quercitron bark. When treated hot water, flavine yields a yellow turbid solu- which, on settling, deposits a yellow-brown er. When employed in dyeing, the cloth is first d with an aluminous mordant (see CALICO- TING); and on subsequent immersion in the on of flavine, a fine yellow colour is fixed on loth. The colouring power of the extract e as imported is so great that one ounce is in dyeing qualities to one pound of quercitron .

AX (*Linum*), a genus of plants comprising the r part of the natural order *Linaceæ*; an nous order allied to *Geraniaceæ* and *Oxalideæ*, consisting of annual and perennial herbaceous s, with a few small shrubs. There are about r known species of this order scattered over be, but most abundant in Europe and the of Africa. Their leaves are simple, entire, ut stipules, and generally alternate. The s FLAX or LINT (*L. usitatissimum*) is an l; a native of Egypt, of some parts of Asia, f the south of Europe, not truly indigenous in n, although now naturalised, and often occur- n cornfields, which is the case also in many of the world. The most common variety of x plant has a very slender erect stem, two or feet high, branching only near the top, so as m a loose corymb of flowers. The leaves are distant, and lanceolate; the flowers of a l blue, rarely white, rather broader than a e; the petals slightly notched along the the sepals ovate, 3-nerved, ciliated, desti- glands; the capsules scarcely longer than lyx, not bursting open elastically, but firmly their seeds, which are dark brown, glossy, ong, flattened, with acute edges, pointed at d, and about a line in length. Another variety, er, is cultivated to some extent in many of Europe, so different, that some botanists it a distinct species (*L. humile* or *L. crepi-* which is less tall, is more inclined to branch, particularly distinguished by its capsules, as long as the calyx, and bursting open elastically when ripe. The seeds are also larger and paler. This variety is called *Springlein* and *Klanglein* by the Germans, the one name referring to the elastic bursting of the capsules, the other to the sound which accompanies it. The former variety is known to them as *Winterlein*, being often sown in the end of autumn in elevated districts where the summer is too short for spring-sown flax, and also as *Schliesslein* and *Dreschlein*, from its close capsules and the thrashing needed to separate the seed. The *Springlein* produces a finer, whiter, and softer fibre than the other, but shorter, and it is therefore not so extensively cultivated. There are many sub-varieties, to which and their different qualities no such attention has been paid, in Britain at least, as to those of other important cultivated plants.

Common Flax (*Linum usitatissimum*).

This plant is highly valuable both for the fibres of its inner bark and for its seeds. The fibres of the inner bark, when separated both from the bark and from the inner woody portion of the stem, are FLAX or LINT, the well-known material of which LINEN thread and cloth are made, and used equally for the finest and for the coarsest fabrics, for the most delicate cambric or exquisite lace, and for the strongest sail-cloth. The seeds yield by expression the *drying* fixed oil called LINSEED OIL, so much used for mixing paints, making varnishes, &c.; whilst the remaining crushed mass is the Linseed Cake, or OIL-CAKE, greatly esteemed for feeding cattle, and when ground to a fine powder, becomes the LINSEED MEAL so useful for poultices. Linseed is sometimes used in medicine, as an emollient and demulcent in irritations of the pulmonary and of the urinary organs, and of the mucous membranes generally, deriving its value for this purpose from a mucilage which it contains, and which is extracted by hot water, making *linseed tea*. The fibre of flax is the ultimate material from which paper is made, and linseed oil is used in the manufacture of printers' ink. No plant not yielding food is more useful to man than the flax plant.

It has been cultivated from the earliest historic times. It is mentioned in the book of Exodus as one of the productions of Egypt in the time of the Pharaohs; and it has been recently ascertained by microscopic examination, that the cloth in which the mummies of Egypt are enveloped is linen. Solomon purchased linen yarn in Egypt. Herodotus speaks of the great flax trade of Egypt. Great quantities of flax are grown in that country at the present day; its cultivation is also very extensively carried on in some parts of Europe and of North America. The proportion of flax to other crops in Britain is probably smaller at present than it was at a former period, but an increase of its cultivation has been strongly recommended by persons whose opinion is entitled to great regard, and particularly in Ireland, where, however, it is more extensively cultivated than either in England or Scotland. It has the advantage of giving employment not only to an agricultural but to a manufacturing population. Flax is more extensively and more successfully cultivated in Belgium than in any other European country, particularly in Southern Brabant, Hainault, and West and East Flanders, in which the most beautiful flax in Europe is produced, employed for the manufacture of the famous Brussels lace, and sold for this purpose at about £100 to £180 per ton, the crop when prepared for the market sometimes exceeding in value the land on which it was produced. The village of Rebeque is distinguished for the production of this precious flax. The greatest care is bestowed on its cultivation, and to this its excellence is probably in a great measure to be ascribed. Not a weed is to be seen, and the care and labour are equal to those of gardening. Flax is extensively grown in the countries on the southern shores of the Baltic, and both the fibre and seed are largely imported from them into Britain. Besides the flax raised at home, the United Kingdom imported in 1872 above 10,624 tons, dressed and undressed.

Flax has been cultivated from time immemorial, as a winter crop, in India, but only for its seed, and not at all for its fibre. This remarkable circumstance is supposed by Dr Royle to be owing to the existence of the cotton plant in that country, the fibre of which more readily offers itself to view on the bursting of the pod. But Dr Royle also states his opinion, that the climate of the greater part of India is unsuitable for the production of the fibre of flax; and the variety cultivated in India is only about a foot or eighteen inches in height, much branched, and yielding a very worthless fibre, whilst it is loaded with capsules, and the seeds yield a larger proportion of oil than those of flax grown in Europe. It is sometimes sown as an edging around fields.

Much depends on the thickness of sowing. Flax must be sown thick to yield a fine fibre; but when intended to produce a fibre for coarser purposes, the plants ought to have more room. For the finest fibre, also, they must be pulled before the seed is ripe; but a coarser fibre and a crop of linseed are often much to be preferred by the farmer. The crop is always *pulled* up by the roots.

The diminished cultivation of flax in Britain, after agriculture began to improve, is to be ascribed in part to the prevalence of the opinion, that it is a very exhausting crop for the land. This has been said to be particularly the case when the seed is ripened. But the introduction of new manures has rendered this objection less important than it formerly was; and it has been found that the refuse of flax itself is not a bad manure, and that the water in which it has been steeped is a good liquid manure. The water of flax-steeping pits or ponds is often strong enough to kill the fish of rivers into which it is allowed to flow.

The capsules (*bolls*) of flax are torn off, after it is pulled, by a sort of combing called *rippling* (see FLAX-DRESSING). Great care is requisite to dry them, and to keep them perfectly dry. For the subsequent processes, see LINSEED.

Besides the common flax, several other species are occasionally cultivated for their fibre, but are comparatively of very little value.

The *Linaceæ* are, in general, plants of elegant appearance and with flowers of much beauty; some of them have flowers larger than common flax, and some are not unfrequent ornaments of our green-houses. *Radiola millegrana*, All-seed, is one of the smallest of British phanerogamous plants.

PURGING FLAX (*Linum catharticum*) is a graceful little annual with branching stem, opposite leaves, and small white flowers, common in fields and meadows throughout Britain and most parts of Europe. It possesses purgative and diuretic properties, owing to the presence of a substance which has been called *linin*. As a domestic medicine, a handful of the fresh herb is often administered, infused in whey; and it has a popular reputation in rheumatism.

FLAX, NEW ZEALAND, a valuable fibre quite different from common flax, and obtained from the leaf of an endogenous, instead of the stem of an exogenous plant. The plant yielding it is *Phormium tenax*, often called New Zealand Flax, and sometimes Flax Lily and Flax Bush. It belongs to the natural order *Liliaceæ*, and is a perennial plant, a native of New Zealand and Norfolk Island;

FLAX-DRESSING. When the s
beginning to change from a green to
brown, is the best time for pulling flax.
the crop grows of different lengths, thes
should be pulled and kept separately, un
in this respect being of great value in the
processes.

The process first gone through after p
rippling—which consists in tearing off the

pulling the stalks through a series of iron teeth 18 inches long, placed within a distance of half an inch of each other. These are fastened in a block of wood, which is placed at the end of a plank or long stool on which the operator sits.

The next process is to obtain the flaxen fibre or lint free from the woody core, or *boon*, of the stem. This is effected by steeping the bundles in water till the boon begins to rot, in which state it is readily separated from the fibre. The operation is called rotting or *retting*, and requires to be managed with great care, as by continuing it too long, decomposition might extend to the fibre, and render it useless; while by discontinuing it too soon, the separation could not be effected with sufficient ease. The time is generally determined by the nature and temperature of the water, and the ripeness of flax decomposition taking place more rapidly oft stagnant water than in running streams, in :h the retting is sometimes conducted. After g sufficiently steeped, the flax is spread out on grass, to rectify any defect in the retting, and mately to dry it for the breaking. In some nts, it is the practice to conduct the retting ely on the grass a process known as dew-ag, in contradistinction to water-retting. This safer and less offensive method, but it requires ch longer time, and in a country where land is able, would become very expensive. On the ole, the mixed method of retting is preferable is, to steep till decomposition of the boon is advanced, and then to complete the process on grass. It has been attempted to separate the e by machinery, without subjecting the flax to steeping; but the article so produced has hitherto been rejected as inferior in quality.

To avoid the delays and uncertainty dependent n the old processes of retting or watering, plans e been recently introduced, bringing the opera more under control, like the other processes of manufactures. The methods which have been ted, and are now working with success, are wn as Schenk's and Watt's. By the first of e, the flax is placed in vats, in which it is down by means of strong framework. Water lowed to pass into the vats, to become absorbed the flax; steam is next admitted, till the temture of the water is raised to, and maintained about 90°. Acetous fermentation ensues in a hours; and after being maintained for about r hours, the decomposition of the gummy or ous matter in the stalk is completed. The lage water is next withdrawn from the vat, and flax taken out, separated and dried either in open air or in desiccating rooms, according to cumstances. In Watt's process, the flax is placed in a chamber provided with a perforated false bottom; the top is double, and filled with water to act as a condenser. Steam being admitted to the case, the first result is the freeing of the flax from certain volatile oils. The steam rising to the top of the chamber is condensed by contact with it, and falls in showers on the flax beneath a decoction of the extracted matter is thus obtained. In 36 hours, the process is completed; and the flax taken out, is passed between rollers in the direction of its length, which presses out the water and decomposed gum, and splits and flattens the straw. By this process, all that the plant takes from the land is saved the seeds being available as food for animals, and the chaff and refuse water as manure.

Prepared by either of the plans, the flax is now ready to be freed completely of its woody particles. This is effected by *scutching*. Previous to this, however, the flax is passed through a *brake* or revolving rollers, in order thoroughly to crack the boon. The brake, worked by manual labour, consists of a frame, in the upper side of which are a number of grooves; a movable piece is hinged at one end, and provided with a similar grooved piece on its lower side, but so placed that the projections pass into the hollows of the lower. The flax, placed between these, and struck by bringing down the hinged part, is broken, but the fibre remains uninjured.

In the flax-breaking machine, the flax is passed through a series of horizontal fluted rollers; the flutes do not touch, thus preserving the fibre while breaking the boon. In continental countries, scutching is almost invariably performed by hand, the flax being held in a groove made in an upright stand, and struck by a flat blade. Machine-scutching is much more certain and expeditious than hand-scutching, and is, in consequence, fast superseding it in this country. After passing through the breaking-machine, the flax is subjected to the action of a series of knives, attached to the arms of a vertical wheel; these knives strike the flax in the direction of its length. The process is gone through three times before the flax is ready for the market. Although machine-scutching is expeditious, it is not capable of that pliant adaptation to the varying nature of the flax to be operated upon, which is obtained in hand-scutching. The effect of machine-scutching is to produce fineness by reducing and impairing, rather than sustaining, the character of the fibre—namely, the length and fineness of its 'staple' or fibre. To remedy these defects, scutching by means of revolving brushes has been introduced. This divides the fibre without tearing it. The subsequent manufacturing operations will be noticed under LINEN AND LINEN MANUFACTURE.

FLAXMAN, JOHN, the greatest of English sculptors, was born at York, 6th July 1755. At the age of 15, he became a student in the Royal Academy, but never worked in the studio of any master. In 1782, he married Miss Ann Denman, a lady of superior gifts and graces, who soon began to exercise a beneficial influence upon his studies. Accompanied by her, he went in 1787 to Italy, where, by degrees, he attracted the attention of all lovers of art. This was still more the case after his return to London in 1794. He was elected an Associate of the Royal Academy in 1797; Royal Academician in 1800; and, in 1810, was appointed Professor of Sculpture to that institution. After the death of his wife in 1820, he withdrew from society, and died 7th December 1826. F.'s most celebrated works are his 'Outlines to Homer's Odyssey' (Rome, 1793), and 'The Iliad' (Lond. 1795), and his illustrations of Dante and Æschylus. Many of his works display wonderful grandeur of composition, and a pure and noble style. He was one of the first of those who, following the example of Winckelmann, strove to penetrate to the true spirit of antique art, in opposition to the false taste of the time. The study of vase-paintings, and of the Pompeian mural pictures, then just revived, led him to abandon the sickly mannerism of his predecessors for the severe simplicity of the antique, and he may with justice be styled the author of modern *rilievo* (see ALTO-RILIEVO). His works are not, however, all of equal value, and, in general, it may be said that his skill in modelling was not equal to his inventive genius. The poetry of his conceptions is of a high order. F. contributed much towards bringing the outline style, now so popular, into general use. Of his sculptures, the best known in England are his bas-relief monument to the poet Collins at Chichester, the monument to Lord Mansfield, and that to the Baring family at Micheldean Church, in Hampshire. His model for the shield of Achilles, taken from the 18th book of the *Iliad*, is particularly worthy of admiration. F.'s private collection is now in University College, London, in the gallery known as *Flaxman Hall.*

FLEA (*Pulex*), a Linnæan genus of apterous insects, now commonly regarded by entomologists as constituting a distinct order, *Suctoria*, *Siphonaptera*, or *Aphaniptera*. The species are not numerous, and little subdivision of the genus has been attempted. It has been suggested as probable, that further investigation may lead to a recognition of the fleas as belonging to some of the larger orders, with parts modified to suit their parasitical life. All the species are very similar to the COMMON FLEA (*P. irritans*), which is plentiful in all parts of the world, living by sucking the blood of man, and of some species of quadrupeds and birds. It abounds particularly in the nests of poultry, pigeons, and swallows, and wherever sand and dust accumulate in the chinks of floors, &c; it is to be found also plentifully in beds, wherever cleanliness is neglected. The abundance of fleas in some countries is an intolerable nuisance to travellers, and also to residents. Such is said to be particularly the case in many parts of Australia, where the general dryness and warmth encourage their growth to an extent against which the precautionary measures of housewives are almost entirely unavailing. The female flea is rather larger than the male, but the sexes are otherwise very similar. The head is small, very compressed, rounded above, and has on each side a small round eye. The mouth has two lancet-like mandibles, the maxillæ being represented by two conical scales, the mandibles and maxillæ forming a suctorial beak, with a slender bristle-like tongue, the whole enclosed between two three-jointed plates. The thorax consists of three segments, the second and third of which bear a scale on each side; the scales are regarded as rudimentary wings. There is no marked division between the thorax and the abdomen, which consists of nine segments, much larger than those of the thorax, but much compressed. The whole body is covered with a tough integument. The activity of the flea, its power of leaping, and its extraordinary strength, are well known. Its strength has sometimes been applied to the drawing of miniature carriages, cannon, &c., which the public have been invited to witness through a magnifying-glass, as an amusing spectacle. Fleas undergo a complete metamorphosis. The female lays about a dozen eggs of a white colour, and slightly viscous. The larva is a lively little worm, at first white, afterwards reddish, and destitute of feet. When about to change into a pupa, it encloses itself in a little silk cocoon, from which emerges the perfect flea. Cleanliness and careful attention are the principal means of keeping beds and houses free of fleas; but where these are found insufficient, as is apt to be the case in some climates, and in cottages where there is much wood-work with gaping joints, ce
aromatic plants are employed, of wh

FLECKNOE, RICHARD, the of
is unknown, is said to have b

ic priest. He came to London, mingled in rs of the wits, and wrote several plays, all ch are now forgotten. He died in 1678. F. under the lash of Dryden, whose satire, d *Mac Flecnoe*, is partly the model of Pope's *ad* (q. v.), and will be remembered as long as eat satirist is remembered. From those who quainted with our extinct literature, we have surance that F. has been hardly dealt with; ough he did not rise to the rank of Dryden poet, he was the author of several fugitive not without grace, fancy, and happy turns ression. Among his dramatic pieces are s, *or the Chaste Lady*; *Love's Dominion* d in 1654, and dedicated to Cromwell's ite daughter, Mrs Claypole; and *The Mar- of Oceanus and Britannia*. His *Miscellanea*, *ms of all Sorts*, appeared in 1653.

ET (that which floats), a collection of ships, r of war or commerce, for one object or for one tion. The diminutives of fleet are 'division' quadron.' In the royal navy, a fleet is ordi- the command of an admiral or vice-admiral.

ET MARRIAGES. The practice of con- g clandestine marriages was very prevalent gland before the passing of the first mar- act (see MARRIAGE). The chapels at the and at May Fair, in London, were long for the performance of these marriages; other place was equal in notoriety for nfamous traffic to the Fleet Prison. It be observed, that before the passing of the . II. c. 33, there was no necessity in Eng r any religious ceremonial in the perform- f marriage, which might be contracted by verbal consent. Hence it was not in virtue special privilege existing within the liberty Fleet that marriages at that place became so n; but rather from the fact, that the persons om they were performed, having nothing to ther in money or character, were able to set ance the penalties enacted from time to time view to restrain this public nuisance. The during which these marriages were in greatest was from 1674 to 1754. The first notice of a marriage is in 1613, in a letter from Alderman to Lady Hickes, and the first entry in a register 4. Up to this time, it does not appear rriages contracted at the Fleet were , but in the latter year, an order having d by the ecclesiastical commissioners performance of clandestine marriages in voy and May Fair, the Fleet at once became vourite resort for those who desired to effect et marriage. At first, the ceremony was d in the chapel in the Fleet; but the s became so frequent, that a regular trade ung up. By 10 Anne, c. 19, s. 176, in chapels without banns were prohibited in penalties, and from this time, rooms up in the taverns and the houses of parsons, for the purpose of performing remony. The persons who celebrated these ges were clergymen of the Church of England, ad been consigned for debt to the prison of et. These men, having lost all sense of their alling, employed touters to bring to them ersons as required their office. The sums r a marriage varied according to the rank of rties, from half a crown to a large fee where erality and the purse combined to afford a eward. During the time that this iniquitous was at its height, every species of enormity ractised. Young ladies were compelled to against their will; young men were decoyed into a union with the most infamous characters; and persons in shoals resorted to the parsons to be united in bonds which they had no intention should bind them, and which were speedily broken to be contracted with some new favourite. The sailors from the neighbouring docks were steady patrons of this mode: it was stated by the keeper of one of the taverns, that often, when the fleet was in, two or three hundred marriages were contracted in a week. Persons of a more respectable character also at times resorted to the Fleet. Thus the Hon. Henry Fox was here married to Georgina Caroline, daughter of the second Duke of Richmond. Pennant thus describes the neighbourhood of the Fleet in his time: 'In walking along the street in my youth, on the side next the prison, I have often been tempted by the question: "Sir, will you be pleased to walk in and be married?" Along this most lawless space was hung up the frequent sign of a male and female hand conjoined, with "marriages performed within" written beneath. A dirty fellow invited you in. The parson was seen walking before his shop, a squalid, dirty figure, clad in a tattered plaid night-gown, with a fiery face, and ready to couple you for a dram of gin or a pipe of tobacco.' *London*, p. 193. Registers of these marriages were kept by the various parties who officiated. A collection of these books, purchased by government in 1821, and deposited in the Consistory Court of London, amounted to the incredible number of between two and three hundred large registers, and upwards of one thousand smaller books, called pocket books. These registers were not received as evidence in a court of law (*Doe d Dacres* v. *Gatacre*, 8 Carr. and P. 578), not because the marriage was invalid, but because the parties engaged in the ceremony were so worthless that they were deemed undeserving of credit. Various attempts were made to stop this practice by acts of parliament. By 6 and 7 Will. III. c. 52, and again by 7 and 8 Will. III c. 35, penalties were imposed on clergymen celebrating any marriage without banns; but these provisions were without effect upon men who had nothing to lose. At length, the nuisance became intolerable, for, owing to the difficulty of proving these marriages, respectable parties, who in folly had entered into them, found it often impossible to establish their marriage, and the greatest confusion was in consequence produced. The act of the 26th Geo. II. c. 33, was therefore passed, which struck at the root of the matter by declaring that all marriages, except in Scotland, solemnised otherwise than in a church or public chapel, where banns have been published, unless by special licence, should be utterly void. This act met with strenuous opposition in the House of Commons, especially by Mr Fox, who had been himself married in the Fleet, but ultimately it was passed into a law. The public, however, were unwilling to surrender their privilege, and on the 26th March 1754, the day before the act came into operation, there were no less than 217 marriages entered in one register alone. See Burn's *History of Fleet Marriages*, to which we are indebted for many of the above particulars.

FLEET PRISON, a celebrated London jail, which stood on the east side of Farringdon Street, on what was formerly called Fleet Market. The keeper of it was called the Warden of the Fleet. It derived its name from the Fleet rivulet, so named from its rapidity, which flowed into the Thames. By the Act 5 and 6 Victoria, the Fleet Prison and the Marshalsea were abolished, and their functions transferred to the Queen's Bench, under the new name of the Queen's Prison. The Fleet was the king's prison so far back as the 12th c., and a receptacle for debtors since about the same period. The followers of Wat Tyler burned it in the reign of Richard II. In the 16th and 17th centuries, it acquired a high historical interest from its having been the prison of the religious martyrs of the reigns of Mary and Elizabeth, and of the political victims of the Courts of the Star Chamber and High Commission in that of Charles I. On the abolition of the Star Chamber in 1641, it became a place of confinement for debtors and persons committed for contempt from the Courts of Chancery, Exchequer, and Common Pleas. During the 18th c., it was the scene of every kind of atrocity and brutality, from the extortion of the keepers and the custom of the warden underletting it. The Fleet was several times rebuilt; the last building was erected after the burning of the older one in the Gordon riots of 1780, the predecessor of which had been destroyed in the great fire of London in 1666. Latterly, it usually contained 250 prisoners, and kept ward of about 60 outdoor *detenus* for debt, privileged to live within the rules.

FLEETWOOD, or FLEETWOOD-ON-WYRE, a small but thriving town, seaport, and military station of England, in the county of Lancashire, is situated on a promontory at the mouth of the estuary of the Wyre, about 20 miles south-west from Lancaster. It is a modern town, and owes its origin and importance to its facilities for railway and steam-vessel communication. It is handsomely laid out, has an excellent harbour, and is a favourite resort for sea-bathing. A government school of musketry, which promises to be for the north of England what Hythe and Aldershott are for the south, is now in full operation here. It has a staff of instructors, and quarters for 300 men and 60 officers; besides a substantial hut-encampment, about a mile from the town, for 200 men and 14 officers, where there are quarters for married soldiers, hospital, lecture-rooms, &c., and a large tract of land for rifle practice. In 1872, 707 vessels, of 186,991 tons, entered; and 636, of 185,058 tons, cleared the port. Pop. (1871) 4428.

FLEMISH LANGUAGE AND LITERATURE. The Vlaemisch or Flemish is a form of Low German still spoken in the Belgian provinces of East and West Flanders, Limburg, Antwerp, North Brabant, and in some parts of Holland and the Walloon provinces of Belgium. So little change has taken place in this dialect, that the form of speech in which the Council of Liptines drew up (in 742) the creed, in which pagans were made to express their renunciation of idolatry on being converted to Christianity, requires only the alteration of a few letters to make it intelligible to a modern Fleming. Flemish has much affinity with the Frisian, and constitutes, together with modern Dutch (which was originally identical with it, and now only differs from it in a few orthographical and otherwise unessential particulars), the national tongue of the whole of the Low Countries. The most ancient record of Flemish, is a fragment of a translation in prose of the Psalms a thousand years old. In the 13th c., public deeds began to be drawn up in the vernacular, which are perfectly intelligible in the present day (as the Ordinance of Henry I. of Brabant, 1229, in the *Brussels Book of Privileges*). In the same century, J. van Maerlant, the 'father of Flemish poets,' author of *The Historical Mirror*, *Wapen Martin*, *Rymbibel*, &c., and W. van Utenhove composed numerous poems, and translated from the French and German, and very probably from the Latin. Willems and other critics believe that to the Flemish must be ascribed the honour of the original and entire poem of *Reinaert Vos*, the first part of which they refer to the middle of
the 12th c., while the second part is
to W. van Utenhove, and supposed to
written about 1250. The 14th c. was

of various textural elements, which are
in the article Muscle (q. v.). Numerous
have been made of the muscular sub-
various animals. In Dr Day's translation
s *Animal Chemistry,* published by the
Society, there are analyses of the flesh of
ox, calf, pig, roe, pigeon, fowl, carp, and
e following table gives the determinations
ual constituents of the flesh of oxen, or,
anguage, of beef freed, as far as possible,
from blood-vessels, &c., and may be regarded as fairly representing the composition of flesh generally.

			Per cent.		Per cent.
Water	varies	from	74·0	to	80·0
Solid constituents	vary	"	26·0	"	20·0
			100·0		100·0
The latter being made up of					
Muscular fibre which	varies	from	15·40	"	17·70
Gelatigenous substance	"	"	0·60	"	1·90
Albumen	"	"	2·20	"	3·00
Creatine	"	"	0·07	"	0·14
Creatinine			undetermined.		
Inosic acid			do.		
Fat	"	"	1·50	to	2·30
Lactic acid ($C_6H_5O_5,HO$)	"	"	0·60	"	0·68
Phosphoric acid	"	"	0·66	"	0·70
Potash	"	"	0·50	"	0·54
Soda	"	"	0·07	"	0·09
Chloride of sodium	"	"	0·04	"	0·09
Lime	"	"	0·02	"	0·03
Magnesia	"	"	0·04	"	0·08

Long as the above list of substances is, it does not include all the ingredients of flesh. In the freshly expressed muscular juice, which exhibits a strong acid reaction (from free lactic acid, and from acid phosphates of the alkalies), we also find small quantities of Sarcine or Hypoxanthine (q. v.), and of formic, butyric, and acetic acids—which may, however, be mere products of decomposition; very minute quantities of uric acid, and sometimes a trace of urea, which, however, occurs in very appreciable quantity in the muscles of persons who have died of cholera, and in very considerable quantity in the flesh of the plagiostomous fishes, while in other fishes not a trace of it can be detected—an apparent anomaly to which at present we see no clue; and in the juice of the heart of mammals, and in smaller quantity in their other muscles, a kind of sugar termed Inosite (q. v.). Bernard has recently discovered Glycogen (q. v.) in the muscles of the embryos of various animals.

In regard to the inorganic constituents of the juice of flesh, Liebig directs especial attention to the fact, that this fluid 'in all animals is particularly rich in potash, and that it also contains chloride of potassium, with only traces of chloride of sodium; while in the blood only proportionally small quantities of the salts of potash and preponderating quantities of the salts of soda and of common salt, are present.' He further notices the constant excess of the phosphates over the chlorides, and of the phosphate of lime over that of magnesia in the former fluid, as points of physiological importance. The value of these investigations will be shewn in the article Tissues (q. v.).

It is worthy of notice, in connection both with physiology and dietetics, that the dried flesh of the ox is identical in its ultimate composition with dried blood, as is shewn by the following analyses, which were made by Professor Lyon Playfair:

	Beef.	Ox-blood.
Carbon, . .	51·83	51·95
Hydrogen, .	7·57	7·17
Nitrogen, . .	15·01	15·07
Oxygen, . . .	21·37	21·39
Ashes, . . .	4·23	4·42

This analysis singularly confirms the statement made previously by an eminent French physiologist, that in so far as ultimate organic composition is concerned, 'the blood is liquid flesh.'—For further information on the subject, we may refer to Liebig's *Researches on the Chemistry of Food,* translated by Gregory, and Lehmann's *Physiological Chemistry,* vol. iii.

FLESH-FLY, or **BLUE-BOTTLE-FLY** (*Musca vomitoria*), an insect of the same genus with the common House-fly (q. v.), which it much exceeds in size, although it is not equal in size to the

Blow-fly (q. v.). The forehead is rust-coloured, the thorax grayish, the abdomen blue with three black bands. The expanse of wings is nearly one inch. It is abundant throughout Britain and Europe generally, and deposits its eggs on flesh, for which purpose it often enters houses, having a remarkably delicate sense of smelling. The maggots are of very frequent occurrence on meat in summer, notwithstanding all care that can be taken.—A nearly allied species (*M. Cæsar*) is distinguished by its golden green colour, and is also common in Britain. It is found in houses from the beginning of spring to the end of autumn. Another (*M. lardaria*), with silky tawny face, a black stripe on the crown, thorax glittering white with four black stripes, and abdomen bluish-gray, tesselated with black, is most common in the end of autumn, frequenting bushes of ivy and late flowers, and is also a pest of the larder.

FLE'TA, the title of a valuable treatise on the law of England. It is not known by whom this treatise, which is one of the earliest authorities on English law, was written, and it derives its title from the circumstance that it was written in the Fleet prison. Lord Campbell remarks—*Lives of the Chancellors*, i. 166 and note: 'I shall rejoice if I do tardy justice to the memory of Robert Burnel, decidedly the first in this class, and if I attract notice to his successors, who walked in his footsteps. To them, too, we are probably indebted for the treatises entitled *Fleta* and *Britton*, which are said to have been written at the request of the king, and which, though inferior in style and arrangement to Bracton, are wonderful performances for such an age. *Fleta* must have been written after the 13th year of the king (Edward I.), and not much later; for it frequently quotes the statute of Westminster the second, without referring to the later statutes of the reign.

FLETCHER, ANDREW, of Saltoun, a celebrated Scottish patriot and politician, was the son of Sir Robert Fletcher and Catherine Bruce, daughter of Sir Henry Bruce of Clackmannan. He was born in 1653. Notwithstanding the strong anti-English feelings which characterised him through life, F. was of English descent by the father's side; his father being the fifth in the direct line from Sir Bernard Fletcher of the county of York. But his mother was of the royal House of Scotland, the first of the Clackmannan family having been the third son of the Lord of Annandale, Robert de Bruce, who was the grandfather of the great King Robert. F.'s father, who died in his childhood, consigned him to the care of Gilbert Burnet, then minister of Saltoun, afterwards the well-known Bishop of Salisbury; by whom he was instructed not only in literature and religion, but in those principles of free government of which he afterwards became so zealous an advocate. So early as 1681, when he sat in parliament for the first time as commissioner for East Lothian, F. offered so determined an opposition to the measures of the Duke of York (afterwards James II.), then acting as the Royal Commissioner in Scotland, that he found it necessary to retire, first into England, and then into Holland. He there entered into close alliance with the English refugees, who had assembled in considerable numbers; and on his return to England in 1683, he shared the counsels of the party of which Russell, Essex, Howard, Algernon Sydney, and John Hampden (the grandson of the still more famous patriot of the same name) were the leaders. Though usually regarded as a republican, F.'s political creed, like that of Algernon Sydney, approached far nearer to aristocracy than to democracy in the modern sense; for though he was disposed to restrict the monarchical element of the constitution

within the narrowest limits, if not to
altogether, he was so far from being an a

large extent formal and pedantic,
abounds in fine passages, in which the
of Spenser and the gravity of Milton are
mingled.

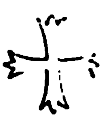
LETCHER, John. See Beaumont and ner.

LEUR-DE-LIS. Authorities are divided as to ether this celebrated emblem is derived from the ite lily of the garden, or from the flag or iris, which, as generally represented, it more resembles both in form and colour. 'Ancient heralds,' says Newton (*Display*, p. 145), 'tell us that the Franks of old had a custom, at the proclamation of their king, to elevate him upon a shield or target, and place in his hand a reed or flag in blossom, instead of a sceptre; and from thence ki of the first and second race in France ented with sceptres in their hands like with its flower, and which flowers became rial figures of France.' However this , or whatever may be the value of the legendary tales, such as that a blue banner, idered with golden fleurs-de-lis, came down heaven; that an angel gave it to King at his baptism, and the like; there can doubt that, from Clovis downwards, the France bore as their arms first an inde-number, and latterly three golden lilies on a ld, or, as heralds would say, azure, three -lis, Or. It was Charles VI. who reduced had hitherto been the indefinite number of le-lis to three, disposed two and one; 'some upon account of the Trinity, others represent the three different races of the of France.' Nisbet, i. 383. Many English tch families bear the fleur-de-lis in some of their shield, and generally with some to France.

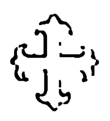
ar-de-Lis.

'S, a small town of Belgium, in the pro-Hainault, is situated north of the left bank Sambre, and 15 miles west of Namur: pop. l. It has been the scene of several con-last and most important, however, being of F., fought here 26th June 1794, between ny of the French Republic, consisting of troops, under Jourdan, and the allies, who inferior in numerical strength, under the of Saxe-Coburg. The latter leader gave for a retreat at the very moment when a advance might have decided the victory favour, and the result was, that Jourdan abled to unite his army with those of the , the Ardennes, and the North, and that the orces were compelled for a time to evacuate .

RY, FLORY, FLOWRY, FLEURETTE, eraldry, signifies that the object is adorned rs-de-lis; A cross-fleury, for example, is a e ends of which are in the form of fleurs-There are several varieties in the modes resenting these crosses, which has led to ions being made between them by heralds rial to be mentioned: but they are all dis-ble from the cross-potance, or potancée, spelled patonce by English heralds. 's *Science of Heraldry*, p. 44). In the amls are in the form of the segments of nd the foliation is a mere bud; whereas the has the limbs straight and the termin-nctly floriated. Thus—



Cross-potance.



Cross-fleury.

Perhaps, the most celebrated instance of this bearing, is in the case of the double prepuce flowery and counter-flowery gules which surrounds the red lion in the royal arms of Scotland, and which Charlemagne is said to have conferred on Achaius, king of Scotland, for assistance in his wars. The object, according to Nisbet (ii. 101), was to shew that, as the lion had defended the lilies of France, these 'hereafter shall continue a defence for the Scots lion, and as a badge of friendship, which has still continued.' That the lilies were assumed in consequence of the intimate relation which prevailed between France and Scotland for so many generations, will not be doubted; but the special occasion of the assumption may not be admitted in our day to be quite beyond the reach of scepticism, notwithstanding Nisbet's assertion that it is so fully instructed by ancient and modern writers that he need not trouble his readers with a long catalogue of them.

FLEURY, Claude, a French church historian, was born at Paris, 6th December 1640, and was educated at first for the law, but preferring an ecclesiastical career, subsequently took priest's orders. In 1672, he became tutor to the young Prince de Conti, who was brought up along with the dauphin, and at a later period, to the Comte de Vermandois, natural son of Louis XIV. After the death of the Comte in 1683, the French monarch appointed him, under Fenelon, tutor to the Princes of Burgundy, Anjou and Berri, and also abbot of the Cistercian monastery of Loc-Dieu. When the princes had completed their education, F. was rewarded with the priorate of Argenteuil. The Duke of Orleans selected him for confessor to the young king, Louis XV., giving as his reason for so doing, that F. was neither Jansenist, nor Molinist, nor Ultramontanist, but Catholic. F. held this office till 1722, when the infirmities of age compelled him to resign it. He died 14th July 1723. F. was as learned as he was modest, and as mild and kind-hearted as he was simple in his manners, and upright in his conduct. Among his numerous works may be mentioned, *Mœurs des Israélites* (Paris, 1681); *Mœurs des Chrétiens* (Paris, 1682); *Traité du Choix et de la Méthode des Études* (Paris, 1686); *Institution au Droit Ecclésiastique* (1687); and, above all, the *Histoire Ecclésiastique* (20 vols., Paris, 1691—1720). On this work, F. laboured thirty years. It is marked by great learning, and, on the whole, by a judiciously critical spirit. What may be called his professional sympathies, are held in check by a noble desire to be impartial, which might well put to the blush the unveracious partisanship of many Protestant writers. Semler (q. v.), an eminent German theological professor, avowed that his lectures were at first mainly extracts from the *Histoire Ecclésiastique*. Even Voltaire praised it. 'The history of F.,' says he, 'is the best that has ever been executed.' D'Alembert and many others recommend F.'s style as a model of elegant simplicity. The so-called *Abrégé de l'histoire Ecclésiastique de Fleury*, published at Berne in 1776, is ascribed to Frederick the Great. A posthumous work of F.'s, entitled *Discours sur les libertés de l'Eglise Gallicane*, has always been very popular.

FLEXURE, or FLEXION, is the bending or curving of a line or figure (see Curvature). A curve is said to have a point of *contrary* flexure at the point where it changes its character of concavity or convexity towards a given line. In the art of building, flexure denotes the bending of loaded beams. If a beam, supported at its two ends, be loaded, it bends, its lower surface becoming convex, and its upper concave. In this bending, the particles in the lower surface are drawn away from each other, and those in the upper are more closely packed together, while between the surfaces there is a line called *the line of no disturbance*, wherein the particles are neither drawn asunder nor compressed, and from which the mathematical theory of the flexure of beams starts. Experiments shew that the flexure of solid beams, supported at their ends, and loaded, varies—(1.) directly as the load; (2.) inversely as the product of their *breadths*, and the cube of their *depths*; and (3.) directly as the cube of the distance between the supports, while the flexure, if the load be uniformly distributed over the beam, is ⅝ths of the amount produced by the load placed on its centre. See Strength of Materials.

FLIES, Spanish or Blistering. See Cantharis.

FLINDERS, Matthew, an adventurous English navigator, to whom we are indebted for a correct knowledge of a great portion of the Australian coasts, was born at Donington, in Lincolnshire, 1760. He entered the merchant service at an early age, and subsequently the royal navy. In 1795, the vessel in which he was midshipman conveyed the governor of New Holland to Botany Bay; and while there, F. determined to investigate the coast south of Port Jackson, about 250 leagues of which were laid down in the charts as 'unknown.' With an equally daring and ambitious young surgeon in his ship, called Bass, he departed on the enterprise in a small decked vessel, with a crew of only six men. Their chief discovery was the straits between Van Diemen's Land (now Tasmania) and the mainland of Australia, which were named after Bass. In 1801, F. obtained from the British government the command of a scientific expedition for the investigation of the Australian coasts and their products. Commencing his examination at Cape Leuwin, F., in the course of two years, gradually explored the coast to Bass's Straits, thence northwards—laying down carefully the Great Barrier Reefs—to the Gulf of Carpentaria, which he thoroughly surveyed across to Timur, then back to Cape Leuwin, and round the south coast to Port Jackson. In 1810 he was liberated from a six years' imprisonment by the French in the Isle of France, returned to England, and gave the world the result of his researches in a work, entitled *A Voyage to Terra Australia*. He died in July 1814, the day on which his book was published.

FLINDERS LAND, now South Australia (q. v.).

FLINDE'RSIA, a genus of trees of the natural order *Cedrelaceæ*, one species of which, *F. australis*, yields timber little inferior to mahogany. It is much used in Australia, and is there called Callicedra Wood.

FLINT, a mineral which may be regarded as a variety of quartz, or as intermediate between quartz and opal, consisting almost entirely of silica, with a very little lime, oxide of iron, water, carbon, and sometimes even traces of organic matter. It has a flat shell-like fracture, is translucent or semi-transparent, and varies in colour from a very dark brown, or almost black, to light brown, red, yellow, and grayish white, and is sometimes veined, clouded, marbled, or spotted. Dark-coloured flints are most common in the chalk, in which principally F. occurs imbedded, forming nodules of various sizes, sometimes large nodular masses, of irregular and often grotesque shape; but gravel formed of light-coloured flints is very common, and it is disputed whether or not a change of colour has taken place by exposure to atmospheric and other chemical agencies. F. is sometimes found in beds or veins. It is very abundant wherever the chalk formation extends, in England and other countries;
rolled F. nodules are also often foun
pound rocks, and in alluvial soils; v

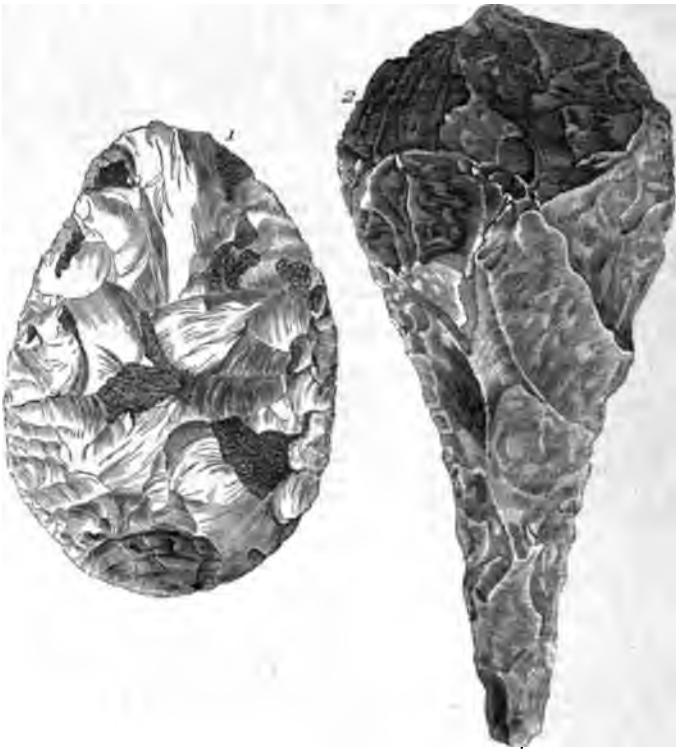
IMPLEMENTS AND WEAPONS, have been used by the primitive inhabit- from time to time, in more or less number, ed up by the plough and the spade, dug ient graves, fortifications, and dwelling- washed up from the beds of lakes and st every country of Europe. They in any material respect, from the flint and weapons still in use among uncivil- Asia, Africa, America, and the islands cific Ocean. The weapons of most fre- urrence are arrow-heads (see ELF ARROWS), s, dagger-blades, and axe heads or Celts more common implements are knives, ps, wedges, and thin curved or semi- ates, to which the name of 'scrapers' has . There is great variety, as well in the the shape, even of articles of the same ere is equal variety in the amount of skill or labour expended in their manufacture. In some instances, the flint has been roughly fashioned into something like the required form by two or three blows; in others, it has been laboriously chipped into the wished-for shape, which is often one of no little elegance. In yet another class of cases, the flint, after being duly shaped, has been ground smooth, or has even received as high a polish as could be given by a modern lapidary. Examples of all the varieties of flint weapons and implements will be found in the British Museum, in the Museum of the Royal Irish Academy at Dublin, in the Museum of the Society of Antiquaries of Scotland at Edinburgh, and above all, in the Museum of the Royal Society of Antiquaries at Copenhagen, which is especially rich in this class of remains. Representations of interesting or characteristic types may be seen in the *Catalogue of the Archæological Museum at Edinburgh in* 1856 (Edin. 1859); in Mr Wilde's *Catalogue of the Antiquities in the Museum of the Royal Irish Academy* (Dubl. 1857—1861); in Worsaae's *Nordiske Oldsager i det Kongelige Museum i Kjöbenhavn* (Copen. 1859); and in M. Frederic Troyon's *Habitations Lacustres* (Lausanne, 1860).

Geological discoveries have recently invested flint implements with a new interest. At Abbeville, at Amiens, at Paris, and elsewhere on the continent, flint weapons, fashioned by the hand of man, have been found along with remains of extinct species of the elephant, the rhinoceros, and other mammals, in undisturbed beds of those deposits of sand, gravel, and clay to which geologists have given the name of 'the drift.' They so far resemble the flint implements and weapons found on the surface of the earth, but are generally of a larger size, of ruder workmanship, and less varied in shape. They have been divided into three classes—round-pointed, as in fig. 1; and sharp-pointed, as in fig. 2, both being chipped to a sharp edge, so as to cut or pierce only at the pointed end; and oval-shaped, as in fig. 3, with a cutting edge all round. The first and second classes vary in length from about four inches to eight or nine inches; the third class is generally about four or five inches long, but examples have been found of no more than two inches, and of as much as eight or nine inches. In no instance has any flint implement discovered in the drift been found either polished or ground. The French antiquary, M. Boucher de Perthes, was the first to call attention to these very interesting remains, in his *Antiquités Celtiques et Antédiluviennes* (Paris, 1847—1857). But it has since been remembered that implements of the same kind were found in a similar position at Hoxne, in Suffolk, along with remains of some gigantic animal, in 1797, and at Gray's Inn Lane, in London, along with remains of an elephant, in 1715. Both these English examples are still preserved—the first in the Museum of the Society of Antiquaries at London, the second in the British Museum, and they are precisely similar in every respect to the examples more recently found in France.

To what age these remains should be assigned, is a question on which geology seems scarcely yet prepared to speak with authority. But, in the words of Mr John Evans, in his essay on 'Flint Implements in the Drift,' in the *Archæologia*, vol. xxxviii. (Lond. 1860), 'thus much appears to be established beyond a doubt, that in a period of antiquity remote beyond any of which we have hitherto found traces, this portion of the globe was peopled by man; and that mankind has here witnessed some of those geological changes by which the so-called diluvial beds were deposited. Whether these were the result of some violent rush



Flint Implements from the Valley of the Somme—Reduced.

of waters, such as may have taken place when "the fountains of the great deep were broken up, and the windows of heaven were opened," or whether of a more gradual action, similar in character to some of those now in operation along the course of our brooks, streams, and ri be matter of dispute. Under any c this great fact remains indisputable, th land which is now 160 feet above the feet above the Somme, has, since the man, been submerged under fresh water, and an aqueous deposit from 20 to 30 feet in thickness, a portion of which, at all events, must have subsided from tranquil water, has been formed upon it; and this, too, has taken place in a country the level of which is now stationary, and the face of which has been little altered since the days when the Gauls and the Romans constructed their sepulchres in the soil overlying the drift which contains these relics of a far earlier race of men.'

FLINTSHIRE, a maritime county of North Wales, bounded on the E. by Cheshire and the river Dee, on the S. and W. by Denbighshire, and on the N. by the Irish Sea. The main portion of the county is 25 miles long by 10 broad, and the larger of the two outlying portions, which lies toward the south-east of the main part, is 10 miles by 5. F. is the smallest of the Welsh counties, its area being only 169,162 acres, of which ¼th is arable. The coast, 20 miles long, is low and sandy, but on the Dee estuary fertile. A hill-range, parallel to the Dee, runs through the length of the county, and rises in Garreg to 825 feet. Another range along the south-west border of the county rises in Moel Famma, 1845 feet. The chief rivers are the Dee, Alyn, and Clwyd. The chief strata are Permian, Carboniferous, and Devonian. Coal, and ores of iron, lead, silver, copper, and zinc are the chief mineral products and exports. In 1870, 3281 tons of lead were raised from 24 mines. The soil is fertile in the plains and vales. In 1873, the total acreage under all crops, bare fallow, and grass, was 125,096, 13,607 acres were under wheat, 12,000 and 7542 under barley. Cotton is the facture. The London, Chester, and Holy way skirts the east and north shores. 76,312. F. sends two members to parliam chief towns are Flint, formerly the c Mold, St Asaph, Holywell, Rhyddlan, den. F. has traces of Roman lead- versed by Wat and Offa's Dykes, and ancient castle and ecclesiastical ruins 7th c., Saxon invaders massacred monks of the monastery of Bangor. Saxons defeated the Welsh here with slaughter, which event gave rise to the plaintive air of *Morfa Rhyddlan*.

FLINTY SLATE, of which there some parts of Scotland, and in many is an impure quartz, assuming a slaty contains about 75 per cent. of silica, being lime, magnesia, oxide of iron, &c. ture is rather splintery than shell-like. or less translucent. It passes by insensib tions into clay-slate, with which it is intimate geological connection. Lydian is a variety of flinty slate.

FLOATING BATTERY is a armed, and made as invulnerable as in defending harbours, or in attacks on marine fortresses. The most remarkable instance of their employment was by the French and Spaniards against Gibraltar, in the memorable siege which lasted from July 1779 to February 1783, when ten of these vessels, carrying 212 large guns, were brought to bear on the fortress; they had sides of

Floating Battery used in the Russian War, 1854–1855

at thickness, and were covered with sloping roofs, ause the shot striking them to glance off inno- ously. But their solidity and strength were vailing against the courage and adroitness of the enders, under the gallant General Elliot, who eeded in destroying them with red hot cannon- . Steam floating batteries of iron were con- ted for the war with Russia in 1854, both by itish and French governments; but, notwith- anding that they rendered good service before aburn, they have since been generally discarded other than purely defensive purposes, as too rous for navigation, and too suffocating from ke that collected between their decks dur ion.—The iron-plated frigates now made as the *Warrior* can scarcely be regarded as ing batteries, being rather frigates rendered ost impenetrable by sheets of iron overlying ir sides. At present (1874) there are 3 floating eries in the British navy.

LOATING ISLANDS exist in some lakes, more rarely in slow and placid rivers. Not requently, they are formed by the detachment of tions of the bank; the interlaced roots of plants ing a fabric sufficiently strong to endure the onal buffeting of waves, and to support soil herbage or even trees to grow in. Floating nds are often formed by aggregation of drift- d in the creeks and bays of tropical rivers, and wafted into the channel of the river when it oded or by the wind, are carried down to the with the soil that has accumulated, and the ation that has established itself upon them. , are sometimes seen at a distance of 50 or 100 s from the mouth of the Ganges, with living s standing erect upon them. Portions of the vial soil from the deltas of rivers, held together the roots of mangroves and other trees, are times also carried out to sea after typhoons urricanes, and ships have, in consequence, n involved in unexpected dangers, as amongst the icebergs of colder latitudes. Imagination has always invested with a peculiar interest the

> Straggling plots, which to and froe doe rome
> In the wide waters;

and ancient legend did not fail to notice the floating islets of the sacred Vandimonian Lake, which were large enough to bear away cattle that were tempted upon them by their fresh green grass; and the island of the Cutulian waters, which carried on its surface a dark and gloomy grove, and was constantly changing its place. A small lake in Artois, near St Omer, is remarkable for the number of its floating islands, as are also the marshy lakes of Comacchio near the Gulf of Venice. Among the largest in the world are those of the Lake of Gerdau, in Prussia, which furnish pasturage for 100 head of cattle; and that of the Lake of Kolk, in Osnabruck, which is covered with beautiful elms. Loch Lomond was long celebrated for its floating island; it, however, can no longer boast of one, as it has long since subsided and become stationary. Floating islands are found in some lakes of Scotland, and also in Ireland, and consist for the most part of large floating masses of peat. Pennant gives a description of one which he saw in Breadalbane, the surface of which exhibited plenty of coarse grass, small willows, and even a little birch tree. More interesting to the scientific inquirer, as presenting a phenomenon not so easily explained, are those floating islands which from time to time appear and disappear in the same spot, of which there is one in the Lake of Derwentwater in Cumberland, one in the Lake Ralang in the province of Smalande in Sweden, and one in Ostrogothia. That in Derwentwater is opposite to the mouth of a stream called the Catgill; and the most probable of the many theories which have been proposed to account for it is that which ascribes it to the waters of the stream, when flooded by rains, getting beneath the interlaced and matted roots of the aquatic plants which there form a close turf on the bottom of the lake. This floating island, when it rises above the water, is most elevated in the centre, and on its being pierced with a fishing-rod, water has spouted up to the height of two feet.

The marshy ground of the vale of Cashmere, and particularly around the city of Cashmere, containing many lakes, and liable to inundations, exhibits a peculiar form of human industry in its numerous FLOATING GARDENS, employed chiefly for the cultivation of cucumbers, melons, and water-melons. These floating gardens may be described as portions of the marshy ground artificially made to float, by cutting through the roots of the reeds, sedges, and other plants about two feet below the surface, upon which mud is then spread. The floating of the garden secures the soil and crop from destruction by inundations.

Floating gardens existed on the Lake of Mexico before the conquest of Mexico by the Spaniards. The Mexicans had made great progress in the art of gardening, and particularly in the cultivation of flowers, which were much used both in their festivities and in their worship. How they were induced to attempt the formation of floating gardens, and at what period it was first done, are mere matters of conjecture. The shallowness of great part of the lake was favourable to the success of the attempt, and perhaps the gradual receding of its waters may be reckoned among the reasons of the gradual diminution of the number of the floating gardens, which have almost ceased to be reckoned among the wonders of the world. The Abbé Clavigero, in his *History of Mexico*, describes them as formed of wicker work, water-plants, and mud; as sometimes more than 20 poles in extent; the largest ones commonly having a small tree in the centre, and sometimes a hut for the cultivator; and as employed for the cultivation both of flowers and culinary plants. Humboldt confirms this description, but states that the real floating gardens, or *chinampas*, are rapidly diminishing in number. The existing *chinampas* are in general not floating gardens, but plots of ground with very wide ditches between them, formed by heaping up earth from the ditches in the swamps or shallows at the side of the lake.

Great part of Bangkok, the capital of Siam, consists of floating houses. See BANGKOK.

FLOATSTONE, a variety of quartz, consisting of fibres—delicate crystals—aggregated so that the whole mass is sponge-like, and so light, owing to the air confined in the interstices, as to float for a while on water. It is found in a limestone of the chalk formation near Paris, in imbedded masses, or incrusting flint nodules.

FLOBECQ, a small town of Belgium, in the province of Hainault, 20 miles north-east of Tournai. It has extensive manufactures of linens, has breweries, salt-works, oil and flour mills, and has two fairs annually. Pop. 5258.

FLODDEN, BATTLE OF. On the 24th January 1502, a 'perpetual peace' was concluded between England and Scotland. In the course of a few years, however, a series of petty quarrels had done much to bring this peaceable arrangement to a termination; and in 1513, on the invasion of France, Scotland's ancient ally, by Henry of England, a war broke out between the two countries. James IV., the chivalrous but rash king of Scotland, summoned the whole array of his kingdom to meet on the Borough or Common Moor of Edinburgh, which extended from the southern walls of the city to the foot of the Braid Hills, and which was then 'a field spacious, and delightful by the shade of many stately and aged oaks.' Here an army, it is said, of 100,000 men assembled. With this force James crossed the border on the 22d August 1513; but instead of advancing at once, and achieving a decisive success, he lingered in the neighbourhood of the Tweed until his army had become reduced by desertion to about 30,000 men. On the 6th September, James took up his position on Flodden Hill, the last and lowest eminence of the Cheviots toward the north-east. On the morning of the 9th, the Earl of Surrey, lieutenant-general of the northern counties of England, at the head of an army of about 32,000 men, advanced from the south-east, crossed the Till by a skilful and unexpected movement, and thus cut off all communication between King James and Scotland. While the English were crossing the Till, the Scots might have attacked them with every chance of success, and their not taking advantage of this opportunity was the first great mistake of the battle. Observing that the English were aiming at a strong position to the north-west of Flodden Hill, and desirous of preventing this, James, having ordered his tents to be set on fire, advanced against them in battle-array. The two armies were drawn up in similar order, each consisting of a centre, a right and left wing, and a reserve placed behind the centre. At about four o'clock on Friday, 9th September, the battle commenced with cannonading on both sides. The Earls of Huntly and Home, who commanded the left wing of the Scottish army, charged the English right, which was led by Sir Edmund Howard, and entirely defeated it. Instead, however, of following up their success, Home's borderers commenced pillaging the baggage of both armies; and Huntly, after his first charge, is said
to have left the field. On the Scottish
clansmen under Lennox and Argyle,
fury by the English archers, rushed for
less of order, and fell with the greatest
upon their opponents, who, however, receiv
with wonderful intrepidity and coolness,

FLOOR-CLOTH, a coarse
both sides, and partly saturated w
one side having usually a coloure
upon it in oil-paint. The canv
cloth is chiefly manufactured in
required to be without seam, and
to cover considerable spaces of
looms are required for wea

from 18 to 24 feet in width, and in lengths from 100 to 113 yards.

The first step towards converting this canvas into floor-cloth consists in stretching it on a frame. This is a work of some difficulty, on account of the great size of the pieces. Some of the frames are as much as 100 feet in length by 24 feet in height, and the canvas must be stretched over it as tight as a drum. The back or plain side of the cloth is first operated upon, by *priming* it with a solution of size, and scouring it with pumice. The object of this is to prevent too much of the paint from penetrating the canvas, and rendering it brittle, and to make an even surface to receive the paint, which is mixed with linseed oil, with very little or no turpentine, and is consequently thicker than common paint. This is thrown or splashed upon the surface with a brush; and then with a long steel trowel the workman spreads the dabs of paint, and produces a tolerably smooth surface. This *trowel-* r is left for 12 or 14 days to dry, and then r coat is laid on in a similar manner; and this tes the back or under side of the floor-cloth.

ile the first coat of the back is drying, the is *primed* and pumiced, and a coat of trowel- laid on. As more care is required on this coat of colour is scoured quite smooth with , and two more trowel-colours are added, and al like the first. Another coat is now on with a brush, and is called a *brush-* forms the ground upon which the is [illegible] printed.

printing is done by means of wood-blocks. attern is first drawn and painted, in its form and colours, upon a piece of paper; piece of paper is now laid under this, and nes of that portion of the pattern included olour are pricked through to the lower . In like manner, pricked outlines of each the other colours are prepared. Each of these d sheets is laid upon a block of pear-tree and dusted over with powdered charcoal or k, and thus the pattern is drawn in dots wood; the carver cuts away the wood the pattern, and leaves it standing in

pear-tree blocks are backed by gluing them ace of deal, and this piece again to another, fibres at right angles, to prevent warping.

olours are spread by boys upon padded covered with floor-cloth, and each printer block upon that containing the required and then places it upon the floor-cloth, ing it with the handle of a short heavy , prints his portion of the pattern. He proceeds with a repetition of this, and as he ces, he is followed in order by the printers other colours, who place their blocks accur- over the pattern the first has commenced. first printer's chief care is to keep the repeti- of the pattern accurately in line.

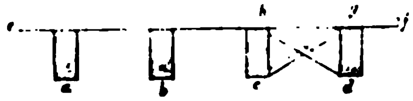
quality of floor-cloth depends mainly upon number of coats of paint, the kind of medium d for the colour, and the time given to drying. best qualities, a fortnight must elapse be- the laying on of each coat, and finally, several ' exposure in the drying-room is necessary. rental of the space thus occupied, and the est of the capital left stagnant during this time, unt to a considerable sum, there is a strong cement to manufacturers to hasten the pro- ss, which may easily be done by using gold size or boiled linseed oil, or other rapid 'dryers,' instead of raw linseed oil; but just in proportion as the ing is hastened by these means, the durability lexibility of the floor-cloth are deteriorated. In order to secure the maximum of durability, floor-cloth should still be kept three or four years after it has left the drying-room of the manufacturer, and purchasers should always select those pieces which they have reason to believe have been the longest in stock. Narrow floor-cloth, for stair-carpeting, passages, &c., is made as above, and then cut into the required widths, and printed. It usually has a large pattern in the middle, and a border of a smaller design.

The laying of lobbies and passages with encaustic tiles has lately led to the superseding of floor-cloth in such situations, while for some other purposes, such as covering the floors of churches, reading-rooms, and waiting-rooms at railway-stations, it is superseded by the newly invented material called kamptulicon, or vulcanised India-rubber cloth, which is impervious to wet, soft and quiet to the tread, and warm to the feet. This new material is made plain or figured to resemble painted floor-cloth.

FLOORS, FLOORING, the horizontal partitions between the stories of a building, the upper part of which forms the floor of the apartments above, and the lower portion the ceiling of those below..

Floors are variously constructed, according to their dimensions, and to the weight they have to sustain. *Single-joisted floors* are the simplest and most cheaply constructed, and are used for ordinary buildings, where the distance between the bearings does not exceed 20, or at most 24 feet.

The annexed figure represents a section of a single-joisted floor, in the line of the flooring-boards, and across the joists. These joists are beams laid edge upwards, and resting at their ends upon wall-plates built into the walls. Their width should not be less than two inches, for if narrower, they would be liable to split with the nailing of the flooring-boards. They are placed edge upwards, in order to economise timber, as the strength of a beam to bear a transverse strain varies simply with the breadth and with the square of the depth. See STRENGTH OF MATERIALS. When a deep and long joist is used, there is danger of its twisting or turning over; this is prevented by *strutting*, that is, nailing cross pieces of wood between them, as shewn between the joists *c* and *d* of the figure, or less effectually, by driving pieces of planking between them. Strutting is required when the length of the joists exceeds eight feet. The laths for the ceiling of the room below are nailed to the bottom of the joists. In good substantial work, the distance between the joists from centre to centre is about 12 inches, but this is often exceeded in cheaply built houses.



a, *b*, *c*, *d*, the joists; *e*, *f*, the flooring boards; *cg* and *dh*, herring-bone strutting.

Double-joisted floors are constructed by laying strong timbers, called *binding-joists*, from wall to wall, at a distance of about six feet apart; and a double set of joists, one above for the floor, and one below for the ceiling, are laid across these, and notched down upon them. These latter, when thus placed, are called *bridging-joists*, as they bridge over the interval between the larger binding-joists. This is adopted when a more perfect ceiling, free from cracks, produced by the yielding of the floor, is required, or where there is a difficulty in obtaining a sufficient amount of long timber for single joisting the whole of the floor.

The framed floor is one degree more complex than the double-joisted. Binding and bridging joists are used in the framed floor, but the binding-joists cease to be the primary support, as for this purpose strong balks of timbers, called *girders*, are used. They are laid across, at distances of from eight to ten feet, and the binding-joists are framed into them by a *tusk-tenon* joint. See CARPENTRY. The bridging-joists are notched to these in the same manner as for double-joisted floors. A *bay* is the general name for the space between girders: if between a girder and wall, it is called a *tail bay;* or between two girders, a *case bay;* and the work between is described as a *bay of joisting.*

When the space to be spanned is too great for a simple wood-girder, trussed or built up wooden girders or iron girders are used: the latter have of late come into extensive use, even where simple wood-girders are applicable. See GIRDER.

With a given quantity of timber, and a moderate space, the single-joisted floor is the strongest of any. One of its disadvantages is the free communication of sound to the apartment below, unless some additional means of obstructing the sound be adopted.

When first laid, the floor should be rather high in the centre, to allow for settling at the joints; and when settled, it should be perfectly level, for if it rises in the middle, it will exert an outward thrust upon the walls, and if hollow, it will pull inwards; but if level, its whole strain is perpendicular.

The flooring-boards are usually nailed to the joists, and vary from 1 to 1¼ inch in thickness; for common floors they are from 7 to 9 inches wide, but for better floors a width of only 3 to 5 inches is used. The advantage of the narrow boards is, that the shrinkage and warping have not so much effect on the spaces between. This refers to the ordinary deal-flooring used in modern British domestic buildings. The facing of the floor in many old mansions is formed of small pieces of oak carefully inlaid. See PARQUETRY. For other kinds of inlaid fancy floors, see MOSAIC, ENCAUSTIC TILES, and CONCRETE. In France, and most of the southern continental countries, where carpets are rarely used, the flooring-boards of the better class of houses are made of hard wood, carefully and closely jointed, and these floors are commonly rubbed with bees-wax, and polished. In humbler dwellings, even the bedrooms are paved with tiles, or strong plaster, or concrete; and considering the prevalence of fleas, &c., in such places, they are certainly better adapted for them than our deal-boards and carpets. They may be freely sprinkled, and even swilled with water in hot weather.

For warehouses where heavy goods are stored, for ball-rooms, &c., special construction is required to adapt the floor to the strain put upon it.

FLO'RA, among the Romans, was the name of the goddess of flowers and of the spring, and was latterly identified with the Greek *Chloris.* Her temple was situated in the vicinity of the *Circus Maximus.* The worship of F. was one of the oldest manifestations of the Roman religious feeling, and is affirmed to have been introduced by Numa. The *Floralia*, or festivals in honour of the goddess, were first instituted 238 B.C., and were celebrated from the 28th of April to the 1st of May, with much licentious merriment, prostitutes playing an important part on such occasions. On coins, F. is represented with a crown of flowers.—In Botany, the term Flora is a collective name for plants, and is used with regard to the vegetable kingdom in the same way as the term *Fauna* with regard to the animal. It is common to speak of the Flora of a country or district; and a work devoted to the botany of a country or district is often Flora of that region.

FLO'RENCE (Ital. FIRENZE), the capital former kingdom of Tuscany, is situated valley of the Arno, in lat. 43° 46′ N., and 11° 15′ E. It is about 123 feet above the of the sea; 60 miles from Leghorn, 40 Siena, and 44 from Arezzo. Pop. (1871) The Arno, spanned by four fine bridges, div city into two unequal parts, the chief stands on the northern bank of the river. shape, an irregular pentagon, F. is walls of about 6 miles in extent, and cates with the exterior by means of which conduct to thickly peopled a lovely, fertile, and salubrious neig encircled by sloping hills, and studded turesque villas and fruitful vineyards and F. and her environs, viewed from th Fiesole, appear but one vast city. population consequent on the establis in 1865, of the seat of the Italian necessitated a considerable extension of and it is now nearly double its form Many causes render this city a most place of residence to foreigners—a lov and healthful climate, cheap living, and sal courteous intelligence of the people, the immense sources of interest possessed by in her grand historical monuments and col art. The massive and austere forms of architecture impart an air of gloomy grand streets, for the most part regular and well kep chief monuments of the city are Il Duomo, Cathedral, the foundations of which were laid great solemnity in 1298. The Florentines ambitiously resolved on erecting a monument for architectural splendour and proportions outvie all preceding structures, the honour paring the design was intrusted to Arn Cambio da Colle. On his death, Giotto tended the works; and many eminent ar were employed before this splendid edifice was pleted—Brunelleschi, the last, conceived and the grand cupola, so much admired by Angelo as to have served him as model for St Peter's. At the side of the cathedral sp the light and elegant bell-tower, detached to the custom of the times. In front tery of San Giovanni, in form an oct a cupola and lantern; all three edific coated with a varied mosaic of black marble. Three bronze gates in bas great additional adornment of the two by Ghiberti have been immortalised by Angelo with the name of Gates of Paradi Sgrilli's description. The church of the Croce, the Pantheon of F. (built in 1 Arnolfo), contains monuments to G Macchiavelli, Michael Angelo, Alfie church of San Lorenzo was consecrated as 393 by St Ambrose, and rebuilt by leschi in 1425, by command of Giovanni de' Medici. It contains an interesting memorial of Cosmo il Vecchio, bea the title *Pater Patriæ*, which had b on his memory by public suffrage the ing his death. In the *Nuova Sagres* Sacristy, are the two famous mo Michael Angelo to Julian and Lorenzo The figures of these two statues are deep and living expression, and in their mute and eloquent beauty. cean chapel, gorgeous with the rarest most costly stones, agate, lapis lazuli, ch &c., stands behind the choir, and con-tombs of the Medici family, and those of the grand dukes their successors. Annexed to the church is the Laurentian Library, with its inexhaustible store of rare MSS., founded by Giulio de' Medici. Bandini has published the catalogue of the Greek, Latin, and Italian MSS.; and Biscioni and Assemani those of the Hebrew and Oriental ones. Amongst the numerous palaces, *Il Bargello*, now converted into a prison, is one of the most ancient, and was formerly the abode of the republican magistrate, the Podestà. In 1841, some interesting portraits were brought to light by the removal of a coating of whitewash from the revered features of Dante, Brunetto Latini, Corso Donati, &c., in the chapel of the palace. The Palazzo Vecchio, the seat of the republican government from its establishment till 1530, when it was abolished, is an imposing mass of building, surmounted by a lofty tower 260 feet high, the great bell of which used to warn the citizens of danger, or summon them to defence. Adjoining the palace is the Piazza del Palazzo Vecchio, a square containing a fine collection of statues, and a noble arcade, the Loggia de' Lanzi, under the porticos of which are magnificent groups of sculpture (see Rastelli's *Illustrazione Storica del Palazzo della Signoria detto Palazzo Vecchio*); Gli Uffizi, a handsome building between the Palazzo Vecchio and the Arno, founded by Cosmo I., in the t floor of which are deposited the archives of the court of justice and other public offices, also the Magliabechi Library of 150,000 volumes, and 12,000 S. On the second floor, in a circular suite of rooms, is contained the famous Florentine gallery art; rich in paintings, engravings, sculpture, nzes, coins, gems, and mosaics. A splendid rtment, known as the Tribuna, contains the est treasures of the collection, and is in itself a nder of art, with its cupola inlaid with mother pearl, and its rich marble pavement. The Palazzo ti, the modern grand ducal residence, boasts of a ch gallery of paintings, and of a collection of are volumes, and 1500 MSS.

e Palazzo Riccardi, now public property, is ch frequented for its fine library. The Palazzo zzi is a fine type of Tuscan architecture ence abounds in other public edifices and numents well meriting notice, but our limits us to omit all mention of them. The cal and philanthropical institutions are also ous and excellently organised. The hospital nta Maria Nuova contains a college of medi- and surgery, which enjoys a European fame. Academy of the Fine Arts and the Museum of ural History afford unlimited resources to the se interested in their collections. There are e hospitals, one lunatic asylum, nine theatres. Academy della Crusca is intrusted with the of sifting and preserving uncorrupted the lian language. The Academy dei Georgofili was blished in the interests of agriculture, the pro- s and needs of which it reports quarterly in the *rnale Agrario Toscano*. For a detailed descrip- n of F., see *Guida della Città di Firenze*, 1822. chief industrial occupations of the Florentines the fabrication of silk and woollen textures, d of straw-plaiting for hats, &c., jewellery, and quisite mosaics in rare stones. Education is more diffused in Tuscany than in any other Italian te; and the Florentines are famous for their stic wit and natural gifts of eloquence, as well as for their shrewd thriftiness and unflagging labour. In their moral superiority to other states y be recognised the effects of a better and more ght government than those which existed in of the other divisions of the peninsula previous late partial union of Italy.

History of Florence.—The city of F. sprang originally from Fiesole (q. v.), at the foot of which it lies extended. The inconvenient and hilly site of the Etruscan Fiesole, perched on the crest of an irregular height, rendered the town so difficult of access to the traders who resorted to its market-places with their varied merchandise, that it was at length decreed they should assemble at the base of the hill, in the fertile plain traversed by the Arno. The few rough shelters erected for the accommodation of these traders may be considered the original nucleus of the important and splendid city of Florence. Such at least is the traditionary history of its origin generally accepted by the Florentine historians. It would seem that as early as the time of Sulla there had been a Roman colony here; another was sent after the death of Julius Cæsar, and it soon became a thriving town. The *Florentini* are mentioned by Tacitus, 16 A. D., as sending delegates to Rome, but it was not till the time of Charlemagne that F. began to rise out of obscurity. It was now governed by a political head with the title of Duke, assisted by various subordinate officers, who were elected by the united suffrages of the duke and citizens. In the 11th c., F., and a great part of Tuscany, were bequeathed to Pope Gregory VII., by his friend and partisan the Countess Matilda, who inherited from her mother, the Countess Beatrix, her jurisdiction over the city. Under the protection of Rome, F. speedily adopted the forms and institutions of a free city; and the republican spirit which then arose amongst the people imparted an impulse to national and individual life, and awoke a spirit of ardent patriotism and splendid enterprise. As early as the 11th c., the Florentines were European traders, and the possessors of grand commercial dépôts in the seaports and cities of France and England, and their skill as workers in gold and jewels had grown proverbial. In proportion as papal preponderance increased in F., that of the empire sank; and in 1113 the citizen forces routed the troops, and slew the delegate of the emperor at Monte Cascioli, near Florence. During the latter wars between pope and empire, F. and all Tuscany seemed to have been saved from the civil feuds which raged throughout Italy between the contending factions of Guelphs and Ghibellines; the former, adherents of the pope; the latter, of the empire. But in 1215, F. became involved in the great party struggle, owing to a private feud breaking out between two noble families, chiefs of the contending principles. A Guelph noble, Buondelmonti, mortally incensed the Ghibelline family of the Amidei, by breaking off his alliance with a daughter of their house, and contracting marriage with a member of a Guelph family. To avenge this insult, the Amidei appealed to their powerful kinsmen, the Uberti, and, in fact, to all the Ghibelline party of Florence. Buondelmonti was stabbed to death as he crossed the bridge of the Ponte Vecchio, and was speedily avenged by the Guelphs in the blood of his enemies. Thus for 33 years was F. distracted by the deeds of bloodshed and violence of these two rival factions, who assumed the names, and adopted the respective causes of Guelph and Ghibelline. See GUELPH AND GHIBELLINE. In 1250, the animosity of these parties seemed somewhat blunted, and public attention was directed to wise internal reforms. Twelve magistrates, or anziani, were appointed in place of the consuls, each of the six sections into which the city was divided being intrusted to two of these magistrates, whose tenure of office was annual. To avoid all local dissensions, two other magistrates, strangers by birth, were elected: the one, invested with supreme authority in civil and criminal cases, was called the podestà; the other, with the title of captain of the people, had the chief

command of the militia, in which were enrolled all the youth of the state, who were bound, at the call of this magistrate, to join their company fully equipped for fight: 20 companies defended the town, 96 the country. After the death of the Emperor Frederick II., the great protector of the Ghibellines, the Guelph or papal party gradually rose in power in F., and during ten years of their predominance, the city ascended in grandeur and prosperity, until it stood not only the first in Tuscany, but one of the first of all Italy. In 1254, the Florentines first coined their noble golden florin, unequalled at the time for beauty: in weight, a drachm, it bore on one side the national emblem, a lily; and on the reverse, the effigy of the popular patron, St John the Baptist. It commemorated a period of great success in the annals of F., whose forces had successively humbled the adjoining towns of Siena, Arezzo, Pisa, and Pistoja in 1252, and in 1254 captured Volterra. In 1260, the standard of civil war was again raised by the Ghibellines of F., who, in league with Manfred of Naples, attacked the Guelphs, and cut their forces to pieces in the sanguinary battle of Monte Aperto. The conquerors entered F. forthwith in the name of Manfred, abolished all trace of the popular institutions, establishing an exclusively aristocratic executive, and even strongly advocated the entire destruction of the city, the hotbed of Guelphism. This barbarous scheme was indignantly repudiated by their own famous leader, Farinata degli Uberti, immortalised by Dante for his patriotism. He declared his intention of heading the Guelphs, were such a sacrilege perpetrated by his own party. Pope Urban IV., French by birth, summoned against the Ghibelline Manfred a French army, led by Charles of Valois, to whom he offered the prospective kingdom of the Two Sicilies. Manfred was defeated and slain in the famous battle of Benevento, and Guelph ascendency was restored anew throughout Italy and Florence. Charles fully restored to the Florentines their internal institutions, and received their offered allegiance for ten years, 1266. In 1282, the *Priori*, a new executive power, was established in F.; and in 1293, by the consent of the Priori, a higher chief than their own order was elected, with the title of *Gonfaloniere*. In 1300, Dante became one of the Priori, and the former feud was recommenced with new vigour between two factions, who bore the names of Bianchi (Whites) and Neri (Blacks). Their dissensions were, however, interrupted by the appearance of Charles of Valois, sent by Boniface VIII. to restore tranquillity, 1301. Charles espoused the part of the Guelphs or Neri, and sanctioned every outrage on the Bianchi, who were plundered and murdered barbarously, the survivors being exiled and beggared; among these were Dante, and Petracco dell' Ancisa, the father of Petrarca. In 1306, Pistoja was besieged, and taken by famine with great barbarity. In 1315, the Florentines met with a severe check from the Ghibellines of Pisa, under the command of Uguccione della Faggiula; and in 1325, were completely defeated by Uguccione's successor in command, the valiant Castruccio Castracani, in the battle of Altopascio. F., weakened by long dissensions, and alarmed by Castruccio's threat of marching on the city, appealed to the king of Naples for aid. They received joyfully an officer of the king, entitled the Duke of Athens, sent as royal vicar; and such was the public demoralisation of the moment, they proclaimed him dictator of the republic, unanimously suppressing the offices of priori and gonfaloniere. The intrigues of this ignoble schemer to overturn the republic being discovered, he was ignominiously expelled by a general popular rising, and narrowly preserved his life. An attempt to admit a proportion of the nobles into the government equally failed at this time, and only led to renewed animosity between them and the citizens. This was the last effort of the nobles to secure power. See Macchiavelli, Book ii. A terrible pest decimated F. in 1348, sweeping off 100,000 of her inhabitants. See Boccaccio, *Decameron*. The chief power of F. about this time seems to have been alternately wielded by the democratic families, the Alberti and the Ricci, and by their patrician rivals, the Albizzi, who, for the space of 53 years, guided the republic in the path of independence and progress. In 14[illegible], the ancient and illustrious republic of Pisa (q. v.) fell under the sway of F., after a most heroic resistance. From 1434, the history of F. is intimately bound up with the House of Medici, whose influence supplanted that of the Albizzi. See MEDICI. The Medici were repeatedly banished from F., in consequence of their aiming at sovereign power; and to their intrigues F. owes her final loss of republican rights and institutions. Pope Clement VII., of the House of Medici, formed a league with the Emperor Charles V., by which the liberties of F. were to be extinguished, and the sovereign power to be invested in the pope's bastard son, Alexander de' Medici. In September 1529, an army of imperialists, under the Duke of Orange, entered Tuscany; and on the [illegible] of August 1530, the siege of F. terminated, after a defence of unexampled devotion and bravery on the part of the citizens. Thus fell the name and
of the republic of F., quenched in the best b
of the city, a sacrifice to a renegade pope,
employed both foreign robbers and inte
to destroy and humiliate the city of

FLO'RET. See FLOWER.

FLO'RICULTURE, or CULTIVA
OF FLOWERS. From the
wherever any considerable pr

in civilisation, plants have been cultivated for the sake of their beautiful or fragrant flowers. Flowers have been very generally employed not only to afford gratification, and for the adornment of the person and of houses, particularly on festive occasions, but in many countries also in connection with religious rites. Flower-markets existed in ancient Athens, as in the richest capitals of the modern world. India, China, and Mexico have been famous for the cultivation of flowers, from the earliest periods to which their history can be accurately traced. Artificial means have been employed for the protection and cultivation of delicate exotics, prized only on account of their flowers, far more generally and assiduously than for the cultivation of any fruit-bearing, culinary, or otherwise useful plants. Those who cannot afford more than a very small green-house, almost always devote it to wers; and those who cannot attain even this, a few favoured plants under a frame, or at in a window.

wers are either cultivated in borders of a mainly appropriated to fruit-trees and ry vegetables, or a separate flower-garden is d, consisting generally of parterres cut out wn. Of late years, the separate flower-garden become much more common than formerly. is much room for the display of taste in the and grouping of its parterres, and both in in the humbler flower-border, in the arrangement of the flowers themselves. A common rule always been to place the plants of tallest , generally at the greatest distance from the or alleys from which they are to be viewed, hose which scarcely rise above the ground, rest to the spectator: it is also of evident ortance, except in extensive gardens, that every der or parterre should be gay with flowers ing all the spring, summer, and autumn, on ch account attention must be paid to the xing of plants that flower at different , and for this purpose annuals are often amongst perennial plants and shrubs; whilst always necessary to take care that the com- of colours be such as to please and not the eye, in order to which *complementary* rs are brought together red and green, blue orange, yellow and violet whilst a judicious ure of white blends and harmonises those would otherwise appear unpleasantly con- d. This rule is equally applicable to the ng of flowers in one border, or of parterres ch masses of the same colour are exhibited, produced by an extensive planting of the flower, a practice which has recently become a, and by which the greatest splendour of effect is produced.

flower-garden requires the same attention to its of particular species, and the same assi- digging, cleaning, &c., which are requisite er departments of horticulture. Perennial rous plants generally require to be not unfre- y renewed by parting of the roots or other- as the tuft extends and the flowering stems more numerous, but weaker and less pro- . Many plants are placed in the flower- in summer, which require the protection of frame or green-house in winter.

no department of horticulture have greater changes been effected by cultivation. Even the practised eye has often some difficulty in recognising the splendid varieties which the florist has produced, as the progeny of the unpromising original form. One of the most common effects of cultivation is the production of double flowers, in which the stamens have been converted into petals, as in roses, so that if the flower is perfectly double, it can produce no seed by itself; or, in the case of composite flowers, the florets of the disc assume the same form with the florets of the ray, as in dahlias, asters, &c. Much improvement has been effected by crossing, not so frequently by the real hybridisation of different species, as by the intermixture of artificial varieties already obtained; and many of the finest varieties are the mere result of the careful selection and cultivation of individual plants of superior beauty, and of their progeny.

The green-house, conservatory, stove, &c., in which exotic flowers are cultivated, are noticed in separate articles. But perhaps this article would not be complete without some notice of *window-gardening*, by which a charm is added even to the abodes of the wealthy, particularly in cities, and by which even the poor have the delight of tending a choice exotic or two, and becoming familiar with the beauty of their flowers. The care requisite in window-gardening is the same as for plants kept in flower-pots in the green-house; there must be the same re-potting, pruning of the roots, &c., from time to time, and at least as much attention in giving water and air. Of the former, the most common mistake is to give too much, and of the latter too little. It is a good rule, that except immediately after water is given, it should never be seen in the saucer; nor should the earth appear *very* moist. The situation, however, being in many respects less favourable, many plants, as heaths, which are frequent in green-houses, cannot be successfully cultivated in the windows of apartments. The common notion that the burning of gas in apartments injures window-plants, does not appear to be well founded. WARDIAN CASES, by means of which many delicate plants are produced in the greatest perfection in the windows of apartments, are noticed in a separate article.

Horticultural Societies (q. v.) have of late done much for the encouragement of the cultivation of flowers, and particularly among the humbler classes of society, with evident increase of amenity within and around their abodes, and an unquestionable tendency to refinement of habits and feelings.

FLORIDA, the name of the most southerly and most nearly tropical member of the United States of North America. Including its adjacent islands and its reef-like chain of keys on the south-west, it stretches in N. lat. between 25° and 31°, and in W. long. between 80° and 87° 44'. The greater portion of it forms a peninsula stretching south-south-east towards the Bahamas, having the Atlantic on the one side, and the Gulf of Mexico on the other. It adjoins, on the north, the states of Georgia and Alabama. Its greatest breadth, from the Atlantic to the river Perdido, is 360 miles; its greatest length about 400 miles; the average breadth of the peninsular portion upwards of 120 miles; area, 60,000 square miles. The principal rivers are the St John's, running north-east through the peninsula, and entering the sea near Jacksonville after a course of 300 miles; the Suwanee, flowing south from Georgia into the Mexican Gulf at Vacassar Bay; the Appalachicola, the Choctawhatchee, Escambia, and Perdido. The principal towns are Tallahassee, the seat of government, situated near the middle of the northern boundary; St Mark's on the Gulf; St Augustine on the Atlantic, the Spanish capital, and the oldest settlement in Anglo-Saxon America; and Pensacola, a port near the Perdido, in the extreme west of the state, recently rendered so conspicuous in the war of secession.

In physical character, the state, generally speaking, is part of the sandy and marshy belt which forms the immediate seaboard from the Potomac to the Mississippi. Nay, far beyond the average of the contiguous shores in either direction, it may, almost without a metaphor, be described as amphibious. To say nothing of inlets, which carry the tide within fifty miles of every point, the interior may literally be said to teem with fresh water, here and there welling up into considerable streams from springs ranging to 250 fathoms in depth. This is more emphatically true of the south, where an immense district, known as Everglades, exhibits, as its normal condition, the ordinary phenomena of a casual inundation. Though the surface is thus better adapted to pasturage than to tillage, yet, in favourable localities, the soil, rather through the influence of heat and moisture than from any inherent fertility, largely yields such productions as sugar, cotton, and rice. Considering that the state shares with the Bahamas the dominion of that great highway of commerce, the Gulf Stream (q. v.), its inexhaustible growth of timber for ship-building is peculiarly valuable. Its coasts and rivers swarm with shoals of fish; while its dependent keys, periodically crusted with salt of the sun's making, furnish the means of curing them.—*Florida*, so called because of its exuberant vegetation, was first made known to Europeans by Ponce de Leon, who landed near St Augustine in 1512. In 1539 it was explored by Fernando de Soto. Originally, the term F. vaguely indicated among the Spaniards the eastern side of the new continent to the north of Mexico, just as the term California received a similarly loose interpretation on the western coast. Gradually, however, it came to be circumscribed by the encroachments of rival powers—its first definite boundaries being established with reference to the claims of English Georgia and French Louisiana. Even within these limits, it embraced, in addition to the F. of the present day, the maritime borders of Alabama and Mississippi. Thus fixed in position and extent, the colony was ceded to England in 1763, and recovered by Spain in 1781. Louisiana having been bought by the U. S. from France in 1803, in 1821 F. was also annexed to the republic by a mixture of force and negotiation.

The same physical character of F. which impairs its economical worth, has added materially to the expenses of its occupation. From about 1836 to 1842 the Seminole Indians, protected by their swamps, tasked the resources of the American Union more than any other domain of equal size ever tasked them. Notwithstanding every drawback the country, possessing, as it does, a comparatively salubrious climate, has made a reasonable progress in wealth and population. In 1870, 2,373,541 acres were in farms, of which 736,172 acres were improved, producing 2,225,056 bushels of Indian corn and 39,789 bales of cotton, besides other crops. The value of the assessed property in the same year was 32,480,843 dollars, and the public indebtedness was 2,180,848 dollars. Railways have only recently been introduced; in January 1872, of 700 miles projected, 428 were completed. The number of schools was, in 1870, 377, including 226 public schools established in accordance with an act of 1869. In 1868 the legislature of F. agreed to the fourteenth amendment of the constitution of the United States, and was recognised as one of the states in the Union. It sends two members to the House of Representatives, besides possessing the two senators belonging to every state.

FLORIDA, GULF OF, the name given to the channel between Florida and the Bahamas, traversed by the Gulf Stream (q. v.). From Florida Reefs on the south, to Settlement Point, the most northern of the Bahamas in the channel, is 200 miles long; greatest breadth at the southern extre miles; at the northern extremity, 65 miles

FLORIDA BLANCA, DON JOSEP COUNT OF, prime minister under Charl Spain, was born in 1728 at Murcia, father was a notary. Having studied manca, he gained soon after such distinc he was appointed Spanish ambassador t XIV. of Rome. In that office, he displa ability, especially in the abolition of the Jesuits and the election of Pius VI. Spanish minister of Foreign Affairs, on missed, was asked by the king to nomina cessor, and accordingly proposed Monino. followed his advice, created Monino Florida Blanca, and intrusted to him, be department of matters of justice and well as the superintendence of posts, highw public magazines. F. used this extensive in introducing post-coaches and good in improving the capital, and attending important departments of general police, as in actively promoting the arts and scien effort to confirm the good understanding Spain and Portugal by a double marriag would have secured the Portuguese thro Spanish prince, was unsuccessful. His undertakings also, the attack upon Algiers and the siege of Gibraltar in 1782, issued nately. Before the king's death in Octob F. presented a defence of his administrati a request for leave to resign. The defe accepted, but the request refused. However Charles IV. in 1792, F.'s enemies obtai disgrace. Imprisoned at first in the ca Pampeluna, he was afterwards released, and h to his estates. He appeared again at the the Cortes in 1808, but died November same year.

FLORIDEÆ. See CERAMIACEÆ.

FLORIN was the name of a gold coin first in Florence (q. v.) in the 13th century. It size of a ducat, and had on one side a lily, and other the head of John the Baptist. Some the name from the city, and others from the These coins were soon imitated all over E It was out of them that the German gold g of the middle ages and the modern guldens These last are still marked by the letters Fl gulden or florin is the unit of account in and the south of Germany. Its value in 2*s*. English; in the other states, 1*s*. 8*d*. has been recently applied to the Engl shilling piece.

FLORI'NIANS, a Gnostic sect of the 2d called from a Roman priest, Florinus, who his fellow-presbyter, Blastus, introduced d resembling those of Valentinus, into Rome, pontificate of Eleutherius (176), and was e from communion by that pontiff. See Gn VALENTINIANS.

FLO'RISTS' FLOWERS are those flowers which have been cultivated with care, and of which, consequently, there [illegible]rous varieties, differing very much in ap from each other and from the original flow are tulips, hyacinths, roses, auriculas, anemones, ranunculuses, dahlias, &c. cultivation of particular flowers was first to a remarkable degree in Europe by the the beginning of the 17th c., and from the lands a passion for it extended to other c particularly to England and Scotland, religious persecutions drove many refugee British shores; and to this day it prevail all where the branches of manufacture introduced by the refugees are carried on. In the little gardens of operatives in some of the manufacturing towns may be seen many of the finest tulips and carnations in Britain. It is still, however, in Holland, and particularly at Haarlem, that this branch of gardening is carried on to the greatest extent, and it is from that quarter that the market of the world is chiefly supplied with bulbs, seeds, &c. Between Alemaer and Leyden are more than twenty acres opriated to hyacinths alone, which succeed best loose sandy soil. The cultivation of roses at ordwyll, in South Holland, is carried on in con- le fields situated in the *dunes*, and affords to many families. Berlin has of late years the seat of a flower-trade, which partially that of Holland. Some flowers, as dahlias llyhocks, are produced in greatest perfection tish cultivators. The Chinese have had their flowers, camellias, hydrangeas, tree peonies, immemorial.

years 1636 and 1637, an extraordinary nia prevailed in Holland, chiefly with to tulips, in which men speculated as ave recently seen them do in railway shares. were sold for enormous sums. For a single *Augustus* (a tulip), 13,000 florins were once and for three such together, 30,000 florins. ownership of a bulb was often divided into Men sold bulbs, which they did not possess, tion of delivering them to the buyers within ted time; and of some varieties, far more ere sold than actually existed. But these ances soon ceased, although not till they olved many persons in ruin.—It was not out the year 1776 that the real flower-trade lland reached its greatest importance; from time it has rather declined. New varieties of and hyacinths are sometimes marked in the an catalogues at prices from 25 to 150 florins.

ORUS, generally, but on insufficient evidence, L. Annæus F., was a Roman historian who hed in the reign of Trajan or Hadrian. Of we know absolutely nothing. He wrote epitome of Roman history (*Epitome de Gestis manorum*), from the foundation of the city to of Augustus. This work, which is still carefully and intelligently composed, but ured by an inflated and metaphorical style. *editio princeps* if, indeed, it be such—ed at the Sorbonne in 1471, F.'s epitome has published times without number. The best edition is that of Dukerus (Lug. Bat. 1722, Leip. 1832).

OTANT (Fr.), used in Heraldry to express object is flying in the air, as a banner-

OTSAM. Wreck, in the legal acceptation of word, is goods which, having been scattered by wreck, have floated to land. From goods in ition of wreck are distinguished those known law of England by the uncouth expressions , *jetsam*, and *ligan*. The first is where the continue floating on the surface of the waves; cond is where, being cast into the sea, they and remain under water; the third is where are sunk in the sea, but are tied to a cork, r, or buoy, in order that they may be ed. If no owner appears to claim them, in these various positions go to the crown, so y a royal grant to a man of *wrecks*, things , *jetsam*, or *ligan* will not pass. See JET- and JETTISON, an important term in the law- nt, from which jetsam must be carefully ished.

FLÖTZ (Ger. level), the name given by Werner to the secondary rocks of Lehmann, because, in the district in which he examined them, they were horizontal. He arranged the rocks which form the solid crust of the earth into four classes. 1. The primitive beds without organic remains, such as granite and gneiss; 2. The transition strata, which, from their more or less metamorphic condition, were related to the primitive rocks on the one side, and from their few contained organisms, to the flötz on the other; 3. The flötz containing all the sedimentary rocks, from the coal-measures up to and including the chalk; and 4. The newer strata, which he called the 'overflowed land' or alluvium. When the followers of Werner found that the horizontal position of the flötz was a local accident, they abandoned the term, and restored Lehmann's title of Secondary.

FLOUNDER (*Platessa*), a genus of fishes, of the Flatfish family (*Pleuronectidæ*), having one row of cutting teeth in each jaw, and generally pavement-like teeth on the pharynx; the dorsal and anal fins extending nearly the whole length of the body, the dorsal not coming further forward than the centre of the upper eye; the tail-fin distinctly separated both from the dorsal and the anal. To this genus belong the Plaice, Flounder, Dab, &c., of the British shores. The species generally known as the F. (*P. Flesus*), is very common, not only on the British shores, but on those of most parts of Europe. Its Swedish name is *Flundra*. Its Scottish name is *Fleuk* or *Fluke*, a name which, with additions, is extended to many other kinds of flat-fish. The F. is often a foot or more in length. Its greatest breadth, without the fins, is about one-third of the whole length, rather less than that of the plaice. It is easily distinguished from the plaice by a row of small tubercles on each side of the lateral line. The colour varies according to the ground from which the fish is taken. The F. is found chiefly in rather shallow water, with sandy or muddy bottom, and equally in the most perfectly salt water and in the brackish water of estuaries. It ascends still rivers into perfectly fresh water, and may be kept in fresh-water ponds. It lives long out of water, and is easily transferred to ponds.—The F., like the other fishes of this genus, generally swims on the left side, and has the eyes on the right side; but reversed specimens are of frequent occurrence.

FLOUR is a popular name given to the finer portions of meal or pulverised grain. Thus, *flour*, or *wheat-flour*, is the fine part of ground wheat; *pea-flour*, of pease, &c. See BREAD.

FLOUR, ST, a small town of France, in the department of Cantal, is finely situated on a steep basaltic plateau at an elevation of 3000 feet, 34 miles east-north-east of Aurillac. It is entirely built of lava and basalt. Its streets are narrow, and its houses in general have a miserable, dark, and dirty appearance. The principal building is the cathedral. A suburb lies at the foot of the rock, and communicates with the town by a winding road cut in the rock. F. has manufactures of hollow ironware, cloth, and table-linen. Pop. (1872) 4046.

FLOURENS, MARIE JEAN PIERRE, a celebrated French physiologist, who was born in 1794 at Maureilhan, Hérault. After having obtained his degree of Doctor of Medicine at Montpellier, at the early age of 19, he proceeded to Paris, where he soon became acquainted with the Cuviers, Geoffroy St Hilaire, and other eminent naturalists. For more than forty years, F. was a voluminous writer on human and comparative anatomy and physiology, on natural history, and on various special departments of the history of the natural and physical sciences.

Among his most important works we may mention his *Recherches Expérimentales sur les Propriétés et les Fonctions du Système Nerveux dans les Animaux Vertèbres* (1824); with a supplementary volume, entitled *Expériences sur le Système Nerveux* (1825); *Recherches sur le Développement des Os et des Dents* (1842); *Anatomie Générale de la Peau et des Membranes Muqueuses* (1843)—a work tending to demonstrate the unity of the human race, by shewing that there are no essential differences between the structure of the skin in the negro and the European—and his *Théorie Expérimentale de la Formation des Os* (1847), perhaps the most celebrated of his works. Among his smaller and popular works, are his *Analyse Raisonnée des Travaux de Georges Cuvier* (1841); *Buffon, Histoire de ses Idées et de ses Travaux* (1844); *De l'Instinct et de l'Intelligence des Animaux* (1841); *Examen de la Phrénologie* (1842); *Histoire de la Découverte de la Circulation du Sang* (1854); *De la Longévité Humaine, et de la Quantité de Vie sur le Globe* (1854); and his *Eloges Historiques*—a beautifully written series of scientific biographies.

As early as 1821, F. delivered a course of lectures on 'The Physiological Theory of Sensations,' and presented some of his first scientific contributions to the Academy of Sciences, into which body he was admitted as a member in 1828. About this date, he was appointed assistant to Cuvier; and in 1832, he succeeded to the full duties of the professorship of natural history in the Jardin du Roi. In 1833, he succeeded Dulong as Perpetual Secretary of the Academy of Sciences—an office which he still continues to discharge; and in 1840, the French Academy elected him a member. He was made a peer of France by Louis Philippe in 1846, and was appointed professor in the Collége de France in 1855. He died at Montgeron, near Paris, December 6, 1867.

FLOWER, or BLOSSOM, that part of a phanerogamous plant in which the organs of reproduction (*stamens* and *pistils*) are situated, and which consists essentially of a single group of these, generally surrounded by *floral envelopes* (the *calyx* and *corolla*). Both the organs of reproduction and the floral envelopes are metamorphosed leaves, and arise in successive whorls from a much shortened axis, called the *thalamus* (Gr. a nuptial-bed), or *torus* (Lat. a couch). Flowers are sometimes closely attached to the stem or branch from which they grow, and are then said to be *sessile* (Lat. sitting); but sometimes there intervenes a *flower-stalk* or *peduncle*, either simple or branched. The whole assemblage of flowers of a plant is called its *Inflorescence* (q. v.), and the different kinds of inflorescence, or modes in which the flowers are produced and grouped, are often as characteristic as the diversities in the flowers themselves, although the latter are in general more important with reference to botanical affinities.

In the very large natural order *Compositæ*, many small flowers are congregated on a common *receptacle*, and surrounded with *bracts* in the form of an *involucre*, as a single flower is surrounded by its calyx. The *head of flowers* is in this case popularly called a flower; and the individual flowers of which it is composed are by botanists styled *florets*. This term is also applied to the individual flowers in the *spikelets* of the Grasses (q. v.), of which the *glumes* are a common involucre.

The order of the whorls in flowers is invariable; the Calyx (q. v.) is always exterior to the Corolla (q. v.); within the corolla are the *Stamens* (q. v.), or male organs of reproduction, and in the centre of all is the *Pistil* (q. v.), the female organ of reproduction. An outer calyx, or whorl of metamorphosed leaves, exterior to the calyx, and usually
is found in some flowers, as mallows, and
the *epicalyx*. Within the corolla, t

The flower is tetramerous, com- ymmetrical, and regular. *b*, Diagramatic section of etrical pentamerous flower of Stone-crop (*Sedum*), ng of five sepals externally, five petals alternating the sepals, ten stamens in two rows, and five carpels ning seeds. The lines on the outside of the carpels are s , Diagram of the trimerous symmetrical flower of re are three alternating divisions of each whorl. m of the flower of Flax (*Linum*), consisting of five five petals, five stamens, and five carpels, each of is partially divided into two. It is pentamerous, te, symmetrical, and regular

development of flowers in most cases follows lete formation of the stem-leaves, more cedes or accompanies it. The unfolding of of a flower is called its *flowering* or *blos-* and when their functions are performed, it the floral envelopes, the stamens, and even sometimes falling off early, and some of times remaining in a withered state until ng of the fruit; the calyx not unfrequently such modifications as to convert it into e fruit itself.

ater number of plants, flowering takes the flowering season, indiscriminately, of the day; and the flowers once opened, remain open, even during night, till they fade. In many plants, however, a *sleep of flowers* takes place; they open and close with the returns of day and night. Thus, *sunflowers* open in the morning, and close at evening; whilst there are other flowers which open in the evening, and close in the morning. Others also open and close at certain hours of the day; thus the flowers of the common purslane open about 11 o'clock A.M., and close soon after midday; *Anthericum pomeridianum* opens its flowers about 2 P.M., and closes them before night; the large fragrant blossoms of *Cereus grandiflorus* open between 7 and 8 P.M., and its sleep commences soon after midnight. In a few plants, the sleeping and waking of the flowers are regulated by the conditions of the weather. The waking and sleeping of flowers either continues for several days in succession, as in some species of *Mesembryanthemum*; or the brief life of the flower ends when it first sleeps, as in the Tiger-flower.

The odours of flowers, extremely various, often delightful, and sometimes very offensive, are in some cases equally powerful as long as the flower is open; in others, they vary in strength at different times of the day. Some flowers, as those of *Hesperis tristis* and *Pelargonium triste*, although remaining open during the day, diffuse their fragrance only when night comes on. The Oriental Hyacinth, so commonly cultivated in windows, is at all times perceptibly fragrant, but fills the atmosphere of the apartment with its perfume about eleven o'clock at night.

The colours of the different parts of flowers, the variety and beauty of which render many of them so attractive, generally remain unchanged, but sometimes undergo changes during the life of the flower. The flowers of *Myosotis versicolor* – a small species of Forget-me-not, very common as a weed in gardens – are sulphur yellow when they first open, and afterwards change to blue. The petals of *Cheiranthus mutabilis*, when they first expand, are yellow, and afterwards pass to orange, red, and finally purple. In *Hydrangea hortensis*, familiar as a window-plant, the flowers are at first green, then rose-colour, purplish red intermixed with green, and finally, when about to fade, they are of a sickly green. Some flowers undergo remarkable changes of colour during the day, as those of the common pink *Phlox*, which, early in the morning, are light blue, and become bright pink as the day advances; and those of *Hibiscus variabilis*, which are white in the morning, pink at noon, and bright red at sunset.

The colours and odours of flowers are subjects in the investigation of which physiologists have not yet been able to go far. The chemical products on which they immediately depend are partially known; but how the chemical changes are wrought, and what various purposes they all serve as to the plant itself, can scarcely be said to have even begun to be ascertained. Both colours and odours are more or less owing to the action of the sun's rays. They are also sometimes modified by soil; and diversities of colour have been obtained in cultivated flowers by changing the soil in which they grow.

A few flowers are edible, although none are of any importance on this account. Some, or parts of them, are used in dyeing; but notwithstanding the beauty and variety of the colours of flowers, a very small proportion of vegetable dye-stuffs is obtained from them; and a similar remark is applicable to their medicinal use. For dyeing and painting, the colours of flowers can seldom be obtained in considerable quantity, except at too great expense, and seldom of brilliancy at all corresponding with that which they exhibit in the flower itself. They are also in general

FLUORE'SCENCE is the term applied to a peculiar blue appearance exhibited by certain substances exposed to sunlight, and especially observable in a dilute solution of sulphate of quinine.

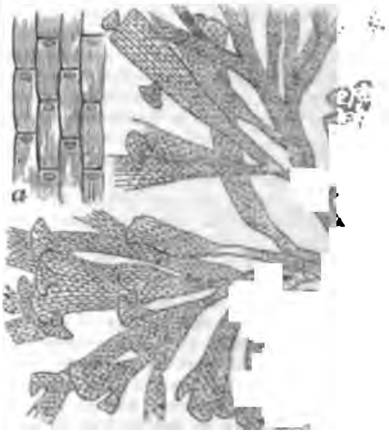
FLU'ORINE is an elementary substance allied to chlorine. Its principal natural source is the mineral, fluor spar (CaF), although it is also found in minute quantities in the igneous rocks, natural waters, plants, the bones and teeth of animals, as also in milk, blood, &c. Many attempts have been made to isolate fluorine, but these have all failed, owing to the extremely energetic nature of the substance, which causes it to unite with substances the moment it is liberated from a previous state of combination. Thus, if fluorine is evolved in glass, gold, platinum, or other metallic vessels, it immediately acts upon and unites with the material of the vessel, and ceases to be free and pure. It would appear, however, to be a gaseous substance, having the equivalent number 19, and with properties similar to chlorine, though differing in energy of action. The compounds of fluorine are not numerous, but are important. *Hydrofluoric acid*, or *fluoric acid* (HF), is generally prepared by heating gently in a lead still a mixture of one part of fluor spar (CaF) with two parts of sulphuric acid ($HOSO_3$), when the vapours of hydrofluoric acid (HF) are evolved, whilst sulphate of lime ($CaOSO_3$) is left in the still. The dense acid vapours are conducted through a lead pipe into a lead receiver or bottle, surrounded by a freezing mixture of ice and common salt. The acid is generally mixed with water when desired to be kept for some time. When the most concentrated hydrofluoric acid is required, the still and receiving vessel must be made of platinum. The other metals are not suitable for such apparatus, as they are rapidly corroded by the acid. When prepared in its strongest form, hydrofluoric acid has the density of 1060 (water = 1000), and is a colourless, fuming liquid of great volatility, which boils at 60° F., and does not freeze at −4° F. Not only does hydrofluoric acid corrode and dissolve the ordinary metals (excepting lead and platinum), but when placed on the skin, it produces a severe burn, owing to its caustic nature. The most important property which hydrofluoric acid possesses is its power of eating into and dissolving glass, which admits of its application in the etching of characters upon glass, as in thermometer tubes, and for eating away greater or less thicknesses of plates or sheets of coloured glass, so as to produce a variety of shades. See GLASS-ETCHING and GLASS-STAINING.

FLUO'ROTYPE, a process in which salts of fluoric acid are employed for the purpose of producing pictures by the agency of light. It was suggested by Robert Hunt in 1844. Two solutions are prepared: one containing 20 grains of bromide of potassium to an ounce of water; and the other, 5 grains of fluoride of sodium to an ounce of water. These are mixed together just previous to using, and applied uniformly over the whole surface of good paper, which is then allowed to dry, and afterwards rendered sensitive by brushing over it a solution of nitrate of silver, sixty grains to an ounce of water. Papers so prepared may be used for the production of pictures in the camera or printing-frame; they require, however, to be intensified by development with protosulphate of iron, the reducing action of which should be regulated by the addition of acetic acid to the solution. The sensibility of the papers for camera-work may be much increased by brushing over them a weak solution of protochloride of tin previous to exposure.

FLUSH, a term used in the navy in decks, which are said to be flush wh without break on one level from the stern. Frigates and all smaller v (excepting a few steamers) are no with flush upper-decks; but what are termed 'flush-decked ships,' are such their guns on the upper-deck, as corv brigs, and smaller vessels.

FLU'SHING (Dutch *Vlissingen*), a st and seaport of the Netherlands, in the Zealand, is situated on the south coast of Walcheren, on the northern shore of the Western Scheldt, in lat. 51° 26′ 3° 36′ E. It is the most important nav the Netherlands, is well built, and dockyards. Its harbour is protected from the violence of the sea, with whi two canals within the town, sufficient deep to allow of the largest merchant loading at the quays, communicate. forts of Rammekens and Breskens in commands the entrance of the S strongly fortified, and has impor arsenals. It also carries on a consi with India, England, and other 12,000. F. is the birthplace of Admir It was stormed and taken by the Eng Walcheren expedition under Lord Chath

FLU'STRA, a genus of zoophytes, of *Polyzoa* (or *Bryozoa*), and order *Infundib* of the species of which are very comm British shores. The name is said to derived by Linnæus from the Saxon *fl*



Portion of Flustra Truncata (from John *Zoophytes*):

ACTION.

, the pointed triangular termination to
an Anchor (q. v.).

(*Dis-*
rum).

, or **FLUKE-WORM** (*Distoma hepati-*
tozoon common in the liver and biliary
minants, particularly of sheep, in which
it produces the disease called *Rot*,
often causing great mortality in
flocks during wet seasons and on
ill-drained lands. It receives its
common name from its resem-
blance in form to the flounder,
of which *fluke* is a Scotch and
old English name. For a similar
reason, it is sometimes called
Plaice. It is a Trematode (q. v.)
worm, higher in organisation than
the cestoid worms, but not so high
as the *Cœlelmintha*. It is gener-
ally not quite an inch in length,
often much less, but sometimes
more: of an oval form, its
breadth about half its length;
flat, in colour not very different
from the liver in which it exists:
yes nor other known organs of special
s hermaphrodite, and the organs of
i occupy great part of its body, the
ranged along the margin; its anterior
urnished with a sucker, and another is
a small distance on the ventral surface,
name *Distoma* (Gr. two-mouthed), but
l sucker alone is perforated, and serves
by which bile, the food of the creature
l; the tube which proceeds from it not,
ecoming a proper intestinal canal, but
g into two large branches, and ending
ramifications in all parts of the body.
numbers of flukes are sometimes found
of a single sheep, and of very different
hey are now believed not to multiply
s formerly supposed. Their eggs, in-
roduced there in great quantity, but
way into the outer world to begin
transformations not yet very accur-
with regard to this particular species,
h the general nature is known. See
TREMATODE WORMS, and GENERATION,
N OF. It seems that the young flukes,
red as *Cercariæ* into the bodies of
molluscs or of aquatic insect larvæ, are conveyed into the stomachs of ruminants feeding on herbage to which these are attached, and finding their way to the liver, there attain their full development. See ROT.

Instances have occurred of the presence of *Distoma hepaticum* in the human liver and *vena portæ;* as well as of a similar species, *D. lanceolatum;* a small species of the same genus, *D. heterophyes*, has been found in great numbers in the human intestines in Egypt, but its influence on the system is unknown; a species of much elongated form, *D. hæmatobium*, is very common in Egypt, infesting the *vena portæ* of man, and the walls of the urinary bladder, and producing local, and afterwards general disease; a small species, *D. ophthalmobium*, has been found in the human eye, but probably through some such accident as in another case has led to the occurrence of the common fluke under the skin of the foot, where it caused a sore. Of all the known species, the Egyptian, *D. hæmatobium*, is by far the most hurtful, as infesting the human body. This species is also remarkably different from the others, in not being hermaphrodite, and in the extreme dissimilarity of the male and female; the female being a thread-like worm, for which a lodgment is provided in a furrow (*gynæcophorus*) on the ventral surface of the male.

The genus *Distoma* or Fluke contains a great number of species, infesting, in their mature state, different kinds of animals, and finding their appropriate place in very different parts of the animal frame. The wrinkled membrane around the eyes of birds is the place of some.

FLUOR SPAR, a mineral which has been often described as chemically *Fluate of Lime*, a compound of fluoric (hydrofluoric) acid and lime, but which is in reality *Fluoride of Calcium* (CaF), consisting of 48·14 fluorine and 51·86 calcium (the base of lime). It occurs both crystallised and massive; the massive varieties exhibiting a crystalline structure; the crystals usually in groups, sometimes of the primary form, which is a cube, but often of secondary forms, of which there is great variety, as the octahedron, rhombic dodecahedron, &c. F. S. is sometimes colourless, but often green, blue, yellow, or red, more rarely gray, or even black; different shades of colour frequently appearing in the same specimen, and in the massive varieties beautifully intermixed. Its colours often rival those of the most beautiful gems; but it is of very inferior hardness, being scratched even by quartz. Its specific gravity is 3·14. It generally becomes phosphorescent when heated, although this is more remarkably the case with some varieties than with others; it is decomposed by heated sulphuric acid, with evolution of hydrofluoric acid as a pungent gas, which, having the property of acting upon and corroding glass, F. S. is used with sulphuric acid for etching on glass. F. S. is also used for ornamental purposes, being wrought into vases, &c., for which it was in high esteem among the ancients. But the greater abundance in which it is now obtained has diminished the value of ornaments made of it. It is very commonly associated with ores of tin, silver, lead, and copper, occurring chiefly in veins, but is also found by itself in drusy cavities in granite, greenstone, &c. It is found only in a few places in Scotland, and in insignificant quantity, but is nowhere more abundant than in England, particularly in Derbyshire and in Cornwall. In Cornwall, it is used as a flux for reducing copper ore. In Derbyshire, the blue massive variety is known to the miners as *Blue John*. The manufacture of ornaments of F. S. is carried on to some extent in Derbyshire. F. S. is often called DERBYSHIRE SPAR.

FLUORE'SCENCE is the term applied to a peculiar blue appearance exhibited by certain substances exposed to sunlight, and especially observable in a dilute solution of sulphate of quinine.

FLU'ORINE is an elementary substance allied to chlorine. Its principal natural source is the mineral, fluor spar (CaF), although it is also found in minute quantities in the igneous rocks, natural waters, plants, the bones and teeth of animals, as also in milk, blood, &c. Many attempts have been made to isolate fluorine, but these have all failed, owing to the extremely energetic nature of the substance, which causes it to unite with substances the moment it is liberated from a previous state of combination. Thus, if fluorine is evolved in glass, gold, platinum, or other metallic vessels, it immediately acts upon and unites with the material of the vessel, and ceases to be free and pure. It would appear, however, to be a gaseous substance, having the equivalent number 19, and with properties similar to chlorine, though differing in energy of action. The compounds of fluorine are not numerous, but are important. *Hydrofluoric acid*, or *fluoric acid* (HF), is generally prepared by heating gently in a lead still a mixture of one part of fluor spar (CaF) with two parts of sulphuric acid ($HOSO_3$), when the vapours of hydrofluoric acid (HF) are evolved, whilst sulphate of lime ($CaOSO_3$) is left in the still. The dense acid vapours are conducted through a lead pipe into a lead receiver or bottle, surrounded by a freezing mixture of ice and common salt. The acid is generally mixed with water when desired to be kept for some time. When the most concentrated hydrofluoric acid is required, the still and receiving vessel must be made of platinum. The other metals are not suitable for such apparatus, as they are rapidly corroded by the acid. When prepared in its strongest form, hydrofluoric acid has the density of 1060 (water = 1000), and is a colourless, fuming liquid of great volatility, which boils at 60° F., and does not freeze at −4° F. Not only does hydrofluoric acid corrode and dissolve the ordinary metals (excepting lead and platinum), but when placed on the skin, it produces a severe burn, owing to its caustic nature. The most important property which hydrofluoric acid possesses is its power of eating into and dissolving glass, which admits of its application in the etching of characters upon glass, as in thermometer tubes, and for eating away greater or less thicknesses of plates or sheets of coloured glass, so as to produce a variety of shades. See GLASS-ETCHING and GLASS-STAINING.

FLUO'ROTYPE, a process in which salts of fluoric acid are employed for the purpose of producing pictures by the agency of light. It was suggested by Robert Hunt in 1844. Two solutions are prepared: one containing 20 grains of bromide of potassium to an ounce of water; and the other, 5 grains of fluoride of sodium to an ounce of water. These are mixed together just previous to using, and applied uniformly over the whole surface of good paper, which is then allowed to dry, and afterwards rendered sensitive by brushing over it a solution of nitrate of silver, sixty grains to an ounce of water. Papers so prepared may be used for the production of pictures in the camera or printing-frame; they require, however, to be intensified by development with protosulphate of iron, the reducing action of which should be regulated by the addition of acetic acid to the solution. The sensibility of the papers for camera-work may be much increased by brushing over them a weak solution of protochloride of tin previous to exposure.

FLUSH, a term used in the navy in decks, which are said to be flush when without break on one level from the bow stern. Frigates and all smaller vessels (excepting a few steamers) are now with flush upper-decks; but what are termed 'flush-decked ships,' are such as their guns on the upper-deck, as brigs, and smaller vessels.

FLU'SHING (Dutch *Vlissingen*), and seaport of the Netherlands, in Zealand, is situated on the south of Walcheren, on the northern shore of the Western Scheldt, in lat. 51° 26' N., 3° 36' E. It is the most important naval the Netherlands, is well built, and has dockyards. Its harbour is protected by from the violence of the sea, with which, two canals within the town, sufficiently deep to allow of the largest loading at the quays, communicate. FLU'STRA, a genus of zoophytes, of *Polyzoa* (or *Bryozoa*), and order of the species of which are very British shores. The name is said to derived by Linnæus from the Saxon

Portion of Flustra Trun (from *Zooph*): a, a few cells magnified.

weave, because of the mat-like polypidoms, which in this genus like, and by unscientific regarded as belonging to the to the animal kingdom. In polypidom assumes the ing frond, with polype cells only, or on both sides; in incrustation on rocks. polype cells are in juxtaposition, and with a border, furnished with or short have the power at once, or the tentacles separately, and shew no little activity, so that a living F., seen through a magnifying-glass, is a most beautiful and interesting object. One of the most common British species is *F. foliacea*, which grows on hard ground in a few fathoms' water, and is continually to be found torn up by the waves, and scattered on the shore. It is an interesting fact, that the same species occurs in the Pacific Ocean.—A single square inch of *F. carbasea*, another common British species, has been found to contain 1800 cells; and as there are about ten square inches in an average polypidom, a single specimen may ordinarily contain about 18,000 polype heads.

FLUTE, one of the oldest wind instruments, [illegible] known to the ancient Greeks, has a soft and [illegible] quality of tone, is an important instru[illegible] in orchestral music, and, in consequence of [illegible] treatment, is, in modern times, much in [illegible] with amateurs. The flute is commonly made [illegible] boxwood or ebony, but sometimes of ivory or [illegible] Its form is that of a taper tube, made in [illegible] pieces, with six holes for the fingers, and with one to fourteen keys, which cover or open holes. The sound is produced by blowing [illegible] the mouth into the embouchure, an oval kind [illegible] at one side of the thick end, which is done [illegible] lips covering a part of the hole, so that the [illegible] its passage from the mouth is broken against opposite edge of the hole, which causes the [illegible] of air inside the tube to vibrate. The notes [illegible] gamut are produced by the opening or shut[illegible] the holes by the fingers of both hands. The [illegible] of the flute is from D to A sharp, nineteen [illegible] intervals. For solo-playing, a flute with a [illegible] from G to C is sometimes used. For orchestral purposes, there are also the *tierce* flute, the [illegible] flute, the E flat and F piccolo flute; and the [illegible] of all, the C piccolo. Improvements on the [illegible] been made from time to time by Quantz, [illegible], Tromlitz, and especially by Böhm in [illegible], and by Rudell and Rose in London.

FLUTE-WORK, the name given to a particular [illegible] of stops in organ-building, in contradistinction [illegible] *reed-work*. There are also numerous stops in [illegible] organs, specially designated with the names [illegible] of different kinds, of eight feet and four feet [illegible], some of which have lately been introduced English organs.

FLUT[illegible], the mouldings in the form of hollows [illegible] cut vertically on the surface of columns. [illegible] adopted by the Greeks as ornaments to [illegible] Ionic, and Corinthian columns, and were [illegible] by the Romans in their architecture. The [illegible] is the only style without flutes. In Doric [illegible] there are 20 flutes on the circumference, and [illegible] curves meet with a sharp edge. These curves [illegible] supposed, in Greek Doric, to be elliptical, and are carried up across the necking to the base of [illegible] cap. In the other styles, there are 24 flutes on circumference (fig. 2). These are semicircular, and are separated by a small fillet; and, before reaching the necking and the base, are terminated with semicircular top and bottom.

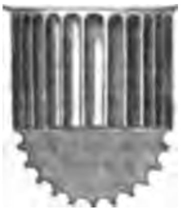

Fig. 1. Fig. 2

Flutes are said to be cabled when they are filled in to about $\frac{1}{3}$ of their height from the base with a convex bead. This is done to strengthen the column and protect the flutes. In countries where Roman remains were abundant, as in the south of France, fluting was sometimes adopted by the early medieval architects, as at Arles and Autun. In Italy also, traces of this decoration are visible during the middle ages; but the flutes soon ceased to be vertical, and, in Romanesque Architecture (q. v.), assumed many varieties of forms, such as curves, zigzags, &c., twisting round the shafts.

FLUX (*fluo*, I flow) is the term given to the substances employed in the arts which cause or facilitate the reduction of a metallic ore and the fusion of the metal. *White flux* is an intimate mixture of ten parts of dry carbonate of soda and thirteen parts of dry carbonate of potash, and is mainly instrumental in withdrawing the silica or combined sand from mineral substances; *black flux* is prepared by heating in close vessels ordinary cream of tartar (bitartrate of potash), when an intimate mixture of finely divided charcoal and carbonate of potash is obtained. The latter flux, when mixed with finely divided metallic ores, and the whole raised to a high temperature in a furnace, is not only useful in removing the silica, which the carbonate of potash it contains enables it to do, but the charcoal withdraws the oxygen from the metallic oxide, and causes the separation of the pure metal. Limestone is employed as the flux in the smelting of iron ores. The other fluxes are fluor spar, borax, protoxide of lead, &c. See IRON, COPPER, &c.

FLUX (Lat. *fluxus*, from *fluo*, I flow), a discharge, generally from a mucous membrane. The term is applied more or less frequently to all preternatural fluid evacuations from the body, but especially to those from the bowels, and from the uterine organs. Dysentery (q. v.) was long termed the bloody flux, to distinguish it from simple diarrhœa. Another scientific term for flux is Profluvium, which gives the name to a large order of diseases in Cullen's *Nosology*. See also CATARRH, MENSTRUATION, and, with respect to etymology only, RHEUMATISM.

FLUXIONS, in Mathematics. The method of fluxions invented by Newton was intimately connected with the notion of velocity uniform and variable; and extended that notion, derived from the consideration of a moving point, to every species of magnitude and quantity. It proposed to determine, in all cases, the rate of increase or decrease of a magnitude or quantity whose value depends on that of another, which itself varies in value at a uniform and given rate. If x and y represent two such quantities, and $y = F(x)$ represent the law of their dependence, and if $\dot{x}$ be supposed to be the velocity with which x increases, and $\dot{y}$ that with which y changes value. Newton undertook by his method to express $\dot{y}$ in terms of $\dot{x}$ and of x, or to find $\dot{y} = F_1(x) . \dot{x}$. The quantities x and y, which in modern language we call the variables, he called *flowing* quantities or *fluents*, and $\dot{x}$, $\dot{y}$, which we should represent by dx and dy, and call differentials, he called the *fluxions* of x and y. See CALCULUS. To illustrate his notation: suppose $y = x^n$, it may be shewn that $\dot{y} = nx^{n-1}\dot{x}$. Regarding now $\dot{y}$ as a quantity depending on x and $\dot{x}$, and supposing x to increase uniformly, in which case $\dot{x}$ is constant, and $(\ddot{x})$ its fluxion zero, we observe that $\dot{y}$ may have a [illegible] for it depends on the value assumed by $nx^{n-1} . \dot{x}$, when x further changes. We find $\dot{(\dot{y})} = n . (n-1) . x^{n-2} . (\dot{x})^2$. Thus, second fluxion or velocity of $\dot{y}$, or $\dot{(\dot{y})}$, Newton wrote $\ddot{y}$. If x had a second fluxion, or did not change uniformly, then that fluxion he wrote $\ddot{x}$. The third fluxion of y he wrote $\dddot{y}$; and so on, pointing as many points over the fluent as there are units in the order of the fluxion. For the fluent, he had no special symbol. Instead of $\int nx^{n-1}dx = x^n$, according to the modern notation, he wrote $|nx^{n-1} . \dot{x}|$, putting the expression in an enclosure. For the principles on which Leibnitz founded his calculus and its notation, see CALCULUS.

FLY, a popular name often given to insects of the order *Diptera* (q. v.) generally, sometimes extended to insects of other orders, and sometimes limited to the *Muscidæ* (q. v.). It is often used with a prefix, as house-fly, blow-fly, &c., to designate particular kinds of insects.

FLY-CATCHER (*Muscicapa*), a genus of birds of the order *Insessores*, tribe *Dentirostres*, and family *Muscicapidæ*, having a moderately long angular bill, broad and depressed at the base, compressed and slightly curved at the point; the base surrounded with hairs or bristles directed forwards, and which help to secure insect prey. The legs and feet are small; the outer toe the longest, and attached to the middle one as far as the first joint. The wings are not long; their first quill-feather is very short; the third is the longest. The birds of this genus, as now restricted, are exclusively confined to the Old World, and mostly to the warmer parts of it. Of the numerous North American birds often called fly catchers, some belong to nearly allied genera, and others to genera not now ranked even in the same family. The true fly catchers all have the habit—

[illegible]

[illegible]

grisola) and the PIED F. (*M. atricapilla* birds about the size of a sparrow, th which is common in most parts of Eu summer bird of passage, but rare in Sc latter is rare in Britain, although abun south of Europe. The spotted F. is br above, white beneath, the head and br with dusky spots. Its voice is a mere remarkable for the choice it makes of its nest, often on a beam in an outhouse, of a fagot-stack, on the branch of a against a building, and sometimes even post in a street. Mr Durham Weir who was a diligent observer of the habi mentions that he witnessed a single pair fly-catchers feed their young no fewer hundred and thirty-seven times in on that their motions were so rapid that he keep his eye off the nest for a moment.

The name F. is often extended to and is sometimes used as co-extensive tion with that of the family *Muscicapidæ*.

FLY-POWDER is the name given pound of metallic arsenic and ar obtained by the partial oxidation of exposure to air, and which is sold on for the purpose of killing flies.

FLY-TRAP. See DIONÆA.

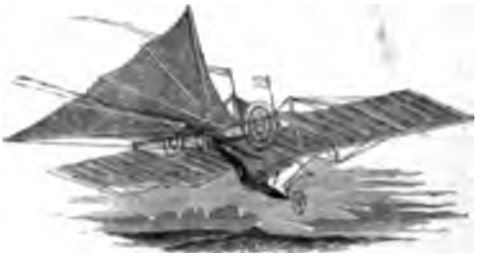
FLYING, or FLIGHT, is the locomo animal in the air, by means of wings, organs adapted to that purpose. By means of the the animal raises itself from the ground tains itself in the air, as well as moves any direction it desires. Birds and bats existing vertebrate animals possess of true flight; the lateral [illegible] Squirrels, Flying Lemurs, Flying [illegible] Flying Dragons, and probably [illegible] toral fins of Flying Fishes, serving only them in the air after the manner of a [illegible] at most to aid, on the principle of a boy's oblique ascent. The extinct reptiles [illegible] dactyles (q. v.) possessed, however, the true flight, as their remains sufficiently [illegible] their wings were constructed [illegible] from those both of birds and of bats [illegible] BIRDS and BATS) are from each other [illegible] all vertebrate animals are the anterior [illegible] thus homologous to the arms of man and legs of ordinary quadrupeds [illegible] answering to those of the hand are [illegible] and consolidated; in bats they are [illegible] elongated; in pterodactyles there was [illegible] of a single finger. Among birds [illegible] power of flight is general, there are [illegible] the rule, the wings of some being [illegible] ary, and at most only helpful to [illegible] those of others being adapted to [illegible] the surface of, but under water.—The [illegible] tebrate animals possessing the power [illegible] insects; to the greater part of which [illegible] its class it belongs [illegible] there are also many insects [illegible] [illegible] and this is sometimes species very closely allied to [illegible] it may, sometimes this great difference the sexes of the same species. The are not at all homologous to the vertebrata, although applied to the structure are widely di [illegible]

In flying the wings are made to [illegible] The stroke in the one direction [illegible] be very different [illegible] from that movement [illegible]

lace for another stroke. This difference
urtly by greater force of muscular action,
ient rapidity; the resistance of the air
he square of the velocity with which the
in giving the stroke. But it is also
tly by the conformation of the wing
uill feathers of birds being so placed that
air with their greatest extent of sur-
roper stroke of the wing, and *obliquely*
to its place. An imitation of this is made
ig of a boat, and is called *feathering the*
ings of bats, consisting of a membrane
ion jointed bones, are probably in part
order to the return from every stroke;
erhaps the case also with the wings of
, although those of others—as the Com-
l the Bee—are certainly incapable of it;
ible that even these may have a greater
gidity communicated to them by the
their air-tubes during the stroke than
uring the return.

analogous to swimming; but the differ-
lium is very great, fresh water being
imes heavier than air, and the density
still greater. The bodies of animals
flight are therefore sometimes adapted
by means which tend to diminish their
e weight, as the air-cavities in birds and
ch, however, are still more important
the increase of muscular power; and
by the increase of muscular power that
f flying is imparted. The exercise of
quisite for swimming is comparatively
ryth part only of that which is requi-
g. How wonderful, then, the muscular
rds capable of long-sustained flight, far
rapidity the speed of the swiftest
engine ever constructed by man! or of
ch in respect at least of rapidity, is in
not inferior to that of the swiftest birds!
ar power exerted in flying evidently
much both among birds and among
e large wings of some require also much
muscular action, either to sustain the
air, to elevate it, or to move it forward.
nparatively small wings of others. The
the wings of humming-birds and
rapid for the eye to follow.

o be wondered at that projects of loco-
igh the air have been much entertained
that, whilst the force of the objections
ed was unknown, artificial wings, and
of the flight of birds, occupied the
f inventors. Grecian fable ascribes
e mythic Dædalus (q. v.), who is said to
, safely over the Ægean Sea on wings
nself had made. More modern stories
ccess, although in far shorter flights, are
nt often resolve themselves, when care-
ied, into exaggerated accounts of feats
n ropes, wings having been perhaps
render the exhibition more attractive,
to render the performance more easy
ent of surface and resistance to the air.
ices are on record of persons who, appa-
ne parachute-like contrivance, descended
m high towers to a considerable distance;
or 14th c., Elmerus, a monk, is said to
more than a furlong from the top of a
ain, but the distance is probably much
; and in the 17th c., Besnier, a lock-
ile, in France, who prudently began from
story high, ventured at last and safely
very elevated positions, and so passed
or over rivers of considerable breadth.
however, were mere feats destitute of utility, although they encouraged the expectation of better results, which was cherished by some of the most scientific men of that period. Bishop Wilkins, in particular, devoted much attention to this subject. Perceiving the inadequacy of the human arm and the muscles which move it to give sufficiently rapid motion to wings of sufficient size, he suggests that 'it were therefore worth the inquiry to consider whether this might not be more probably effected by the labour of the feet, which are naturally more strong and indefatigable.' So confident was he of success, that he anticipated the time when a man should as readily call for his wings to make a journey, as he then did for his boots and his horse. More recently, in the end of the 18th and beginning of the 19th c., Sir George Cayley occupied himself with speculations and experiments on this subject. Acknowledging the difficulty which arises from the want of muscular strength in man, he says: 'It is only necessary to have a first mover, which will generate more power in proportion to its weight, than the animal system of muscles.' But this first mover has not hitherto been found. The employment of steam for this purpose has been frequently proposed. Attempts of this kind, however, have rather for their object aërial navigation than artificial flying, properly so called; although the inventions have been variously designated aërial ships, flying machines, &c. A great difficulty has been found in the weight of the steam-engine and its fuel; and experiments which have cost no small sums, and have excited not a little of public attention, have signally failed through miscalculation on this essential point. Not unfrequently, attempts have been made to combine some modification of the balloon with the steam-engine or other means of propulsion. In no instance, hitherto, has there been the least approach to success, although a *European Aeronautical Society* was formed, and issued its advertisements in 1835; and about eight years afterwards, an *Aerial Transit Company* not only amused the public for a considerable time, but obtained the assent of the British House of Commons to a bill for its constitution. Models have sometimes been exhibited of aerial machines capable of being guided at the pleasure of the aëronaut, in a perfectly still atmosphere, but nothing has yet been invented capable of serving any practical or useful purpose. There is, however, nothing evidently contrary to science or sound philosophy in proposals for aërial navigation, which, in this respect, differs widely from human or artificial flying.



Flying Machine, invented by Mr Henson, 1843.

Perhaps the *aeronautic fish*, on which Marshal Ney is said to have spent 100,000 francs, and which for a considerable time occupied the attention of some of the most ingenious and scientific men in France, deserves particular notice. It was a large balloon, of a long fish-like figure, intended to swim in the air, as a fish in water, and to be propelled by wings or fins working by cranks; an oblique upward direction was to be given to its motion, by a weight placed near the tail; a downward direction by the same weight hauled forward to near the head. But when launched, although it floated and moved forward a little, it turned on one side, and this tendency could not be corrected, so that the experiment proved a complete failure. For further information, see *Chambers's E. Jour.*, No. 227. N. S.

FLYING BRIDGE. See Ferry.

FLYING DRAGON, or FLYING LIZARD (*Draco*), a genus of saurian reptiles, allied to iguanas and stellions, but remarkably distinguished from them, and indeed from all other reptiles now existing, by lateral membranes which support them in a parachute-like manner in the air, and enable them to pass from tree to tree, even to considerable distances. These membranes are supported on the first six false ribs, which, instead of encircling the abdomen, stand out at right angles from the body for this purpose. They are incapable of the movements requisite for true flying; when not in use, they are folded close to the body. There is also in the flying dragons an inflatable pouch under the chin, sustained partly by the hyoid bone and partly by two small bones. The tail is long. The scales are small and imbricated; those of the tail and limbs are keeled. The tongue is extensile, but not greatly so. All the species are of small size, live among the branches of trees, and feed on insects. They are natives of the East Indies. The genus is subdivided by some naturalists. One of the species is figured in the article Dragon.

FLYING FISH, a name given to all those fishes which have the pectoral fins so very large that by means of them they are sustained in short seeming flights in the air. These fishes belong to two very different families—*Scomberesocidæ* and *Sclerogenidæ*; but the name F. F. is sometimes limited to those of the former family, the genus *Exocœtus*; those of the latter being known as *Flying Gurnards*. The genus *Exocœtus* has the pectoral fins nearly as long as the body, the dorsal fin placed over the anal, the tail forked, and its lower division considerably larger than the upper. It is subdivided by some naturalists into several genera, characterised by the presence or absence of barbels, &c. Two species have occasionally been seen near the British shores, one of which (*E. volitans*) is very abundant in the warmer parts of the Atlantic Ocean, the other (*E. exiliens*) is common in the Mediterranean. In the former, the ventral fins are situated far forward, and are short; in the latter, they are situated far back, and are considerably elongated. More than thirty species are known, all inhabiting the seas of the warmer parts of the world, and having their respective geographical limits pretty exactly defined. They swim in shoals; and whole shoals—varying in number from a dozen to one hundred or more—often leave the water at once, darting in the same direction through the air, and after descending into the water at a distance of two hundred yards, or even more, from the place where they arose, quickly renewing their flight. These flights of flying-fishes form one of the most interesting and pleasing spectacles which relieve the monotony of a voyage in the tropical seas. Sometimes, the coryphene (dolphin) may be seen in rapid pursuit, taking great leaps out of the water, and gaining upon his prey, which take shorter and shorter flights, vainly try to escape by doubling like the hare, and sink at last exhausted: sometimes the larger sea-birds catch flying-fishes whilst they are in the air; but it does not seem to be at all true that these fishes leave the water, as has been very generally imagined, merely to escape from danger, nor is there any good reason for that sentimental pity which has been
expressed with regard to them, as creatures
and persecuted more than others, and

Flying Fish (*Exocœtus volitans*).

exposed to dangers both in the sea and in
They seem rather to exercise their pow
other creatures, very often merely from the
which they take in the exercise of them, and
the exuberance of their happiness.—The
whether or not the flying fishes use their
fins at all as wings, cannot yet perhaps be
as completely decided; some observers, well
to respect, maintain that they do, alth
course, their power of flight is limited to
that the fins remain quite moist; but a
ponderance of testimony is in favour of the
opinion, which regards the fins as acting
after the manner of a parachute or of

Fish. The pectoral fins are, howe
different appearance from those of
widening almost to the end, which is
the tips of the rays extending consi

the membrane. A very long spine rises from the back of the head. One species (*D. volitans*) is common in the Mediterranean, and is sometimes fifteen inches in length. Its flight is said not to extend to more than about forty yards, but it sometimes rises high enough to fall on the decks of large ships. 'At particular times, especially on the approach of rough weather, in the night, numbers of them may be seen, by the phosphoric light which they emit, making their arched passages in apparent streams of fire.'—Another species inhabits the Indian seas. —Some species of *Apistes*, belonging to the same family, have similarly large pectorals, and make similar flights.

FLYING LEMUR, or **COLUGO** (*Galeopithecus*), sometimes also called **Flying Cat** and **Flying Fox**, a genus of mammalia, generally regarded as con- ting a distinct family, *Galeopithecidæ*, which, ome naturalists is placed, as by Cuvier, among *Cheiroptera* (see Bat), although it is now more only associated with the Lemurs (q. v.), as by us. There are, indeed, evident affinities both rs and bats, but chiefly to the former, with he osteological and other anatomical char- generally agree. Along the sides extends ple membrane or fold of the skin, beginning the throat, and including both the fore and egs as far as the toes, but leaving them free, further stretched along both sides of the tail to ip. In the last particular, it differs from the al membrane of the flying squirrels and flying agers, and more resembles that of bats; but ely differs from that of bats in being compara- thick, and covered on both sides with short hair; and still more in leaving the fore-feet and not being stretched on lengthened finger- ses. Nor can it be used for true flight, but only upport the animal in the air like a parachute, ling it to take enormous leaps of one hundred a or thereby in an inclined plane. It is not yet ctorily determined whether the differences to erved between the specimens of flying lemurs ollections, are to be regarded as differences of cies or of variety. Attempts have been made distinguish several species, but it is difficult on unt of their great similarity. They are from nty inches to two feet in total length, are natives the Indian Archipelago, inhabiting lofty trees in se forests, and feeding on small birds' eggs and as well as on insects. They are nocturnal ir habits. They are very inoffensive, and y attempt to bite even when seized. Their resembles the low cackling of a goose. They duce generally two young ones at a birth. The w islanders greatly esteem them as food, but have a rank unpleasant smell.

YING PHALA'NGER, or **FLYING OPO'S-** aurus), a genus of marsupial quadrupeds, g several species, natives of New Guinea A alia, where they are generally called lying Squirrels. They are nearly allied langers (q. v.), which they particularly dentition, but have not the tail so long hensile, whilst they are distinguished by a mbrane or fold of the skin extending flanks, and used as a parachute to enable to leap to great distances. This membrane ds along both fore and hind legs almost to toes, but does not appear behind the hind nor include the tail, which is pretty long and y, but which in some of them has a *distichous* racter, the hair spreading out to the sides, and ndering it useful in supporting as well as in ing the body in the air. They are capable of their course in the air, although not of true flight; and their aërial evolutions are very graceful. They repose during the day, and become active in the evening. They feed on fruits, leaves, insects, &c. A New Guinea species is about as large as a flying lemur; one of the Australian species is scarcely larger than a mouse. The fur of some of them is rich and beautiful.—Petaurist has been proposed as an English name for this genus; but is not much used.

1, Flying Phalanger (*Petaurus Taguanoides*); 2, Flying Mouse (*Petaurus Pygmæus*).

FLYING SQUID (*Ommastrephes*), a genus of cephalopodous molluscs, allied to the Calamaries (q. v.) or squids, but differing from them in having the eyes exposed and not covered with skin, the fins united into one as a tail, and the *gladius* or bone furnished with three diverging ribs and a hollow conical appendage. The tail is large, and the power of locomotion great, so that these molluscs not only pass rapidly through the water, but leap out of it, and high enough sometimes to fall upon the decks of ships. They form a principal part of the food of many of the *Cetacea*, and are often the prey of albatrosses, petrels, and other marine birds. They are used as bait for cod in the Newfoundland fisheries.

FLYING SQUIRREL (*Pteromys*), the name given to a considerable number of species of the Squirrel family (*Sciuridæ*), which have a fold of the skin of the flanks extended between the fore and hind legs, and partly supported by bony processes of the feet, by means of which they are enabled to take extraordinary leaps, gliding for a great distance through the air. The tail also aids to support them in the air, as well as to direct their motion, its hairs extending laterally 'in a sort of feathery expansion.' The dentition is similar to that of true squirrels, with which also the habits generally correspond. One species (*P. Sibiricus*) is found in the north of Europe and of Asia; several species are natives of North America, and others inhabit the south-east of Asia and the Indian Archipelago. The European species is about the size of a rat, grayish-ash colour above, white below, the tail only half the length of the body; it lives solitarily in the forests. Its fur is of little value, but skins are sometimes mixed with those of the gray squirrel, to impose on the purchaser. The most common North American species (*P. volucella*), abundant from the Gulf of Mexico to Upper Canada, is fully five inches long, with a tail of five inches additional, fur included. It is of a brownish-gray colour above, white beneath; a black line surrounds the orbit of each eye. All the species inhabit woods, and the night is their time of activity. They feed not only on nuts and young shoots of trees, but also on small birds. They are extremely easy of domestication.

Flying Squirrel (*Pteromys volucella*).

In gliding from tree to tree, the common American flying squirrel descends obliquely and with very rapid motion, until near the tree which it seeks to reach, when it wheels upwards, and alights at about a third of the height which it was from the ground on the tree which it left, the distance between the trees being perhaps fifty feet.

FLY-WHEEL, a large heavy wheel applied to a steam-engine or other machinery in order to equalise the effect of the moving power. Its action depends upon the principle, that a body once set in motion retains a certain amount of moving force or *momentum*. This increases with the weight of the body and the velocity of its motion, and may be expressed relatively by multiplying the weight by the velocity; or stated otherwise, the force required to destroy the motion of a body is equal to that which set it in motion. Thus, a heavy wheel becomes a sort of reservoir of force, when set in motion.

There are two principal cases in which the fly-wheel is commonly applied: first, when the motive power is intermittent or irregular; and second, when the resistance or work to be done is intermittent or irregular. The crank is a good example of the first case. If the force be applied only downwards, as in the common foot-lathe, it will be intermittent, and the crank must rise independently of the prime mover. This is effected by applying a fly-wheel, which is set in motion by the descending pressure of the foot acting upon it through the crank; and the momentum it has thus acquired lifts the crank again to the point where it can be acted upon by the foot. It also carries the crank over the *dead points* (see CRANK), where even a double action of pulling and pressing would be ineffective. The case of a steam-engine turning a long shaft which passes through several workshops, and by means of bands drives a number of lathes, punching, drilling, planing machines, &c., is a common example of the second case, the resistance or work to be done being very variable from one moment to another. In such work as that of a punching-machine, the engine need not be nearly of
power to directly force the punch through
and yet by the aid of the fly-wheel it may
while the punch is rising, the engine is
cating momentum to the fly-wheel; and
descending punch meets with the resistan
to overcome, this reserved momentum is
the direct power of the engine, the punch
through, and the speed of the fly-wheel slac
proportion to the resistance.

The principle of the fly-wheel is
applied in other forms than that of a wh
the hand-coining press, where a heavy ball
at each end of a long lever, which is made
round with considerable velocity, and the
lated momentum is concentrated upon the

TUS, the term applied in Medicine to the ryo, especially in its more advanced human subject, we usually speak of and after the end of the fourth month

several points in relation to the fœtus of great interest both to the physiologist dical jurist. It is frequently of great medico-legal inquiries to be able to the *age* of the fœtus; and to facilitate ation, the physical characters which it presents at different ages have been carefully noted and described.

In the fœtus of nine months—the full term—the length is from 17 to 21 inches; weight from 5 to 9 lb., the average being about 6¼ lb. Even at birth, the average length and weight of the male infant slightly exceeds that of the female. From numerous observations made by Quetelet, it appears that there is an average excess of length of 4·8 lines, and of weight of twelve ounces, in the male infant.

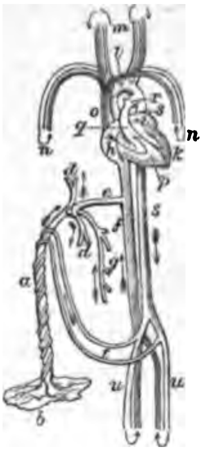
The average weight of infants, without regard to sex, was found by a French observer, Chaussier (who noted the weight in more than 20,000 cases), to be about 6·7 lb.—the maximum being 11·3, and the minimum 3·2 lb. From the inquiries of Dr Joseph Clark (*Philosophical Transactions*, vol. 76), which were made on 60 males and 60 females, the average in this country seems rather higher, the weight of males being 7 lb. 6 oz., and that of the females being nearly 6 lb. 12 oz.; and Sir James Y. Simpson arrived at very nearly the same result. Clark observes that if, at the full time, the weight of the infant is less than 5 lb., it rarely thrives. Various instances are recorded of infants in which the weight at birth has exceeded twice the average weight. Thus a case is recorded by Mr Owen, in the *Lancet* for 1838, in which the child at delivery weighed 17 lb. 12 oz., and was 24 inches in length; and in the *Medico-Chir. Review*, October 1841, there is the mention of a case in which the weight was nearly 18 lb.

There are certain points in which the fœtus at the full period differs anatomically from the child shortly after birth. The bony skeleton is very incomplete, cartilage occurring in the place of many bones. Indeed, complete ossification (viz., of the vertebræ) is not finished until about the 25th year, and the only bones completely ossified at birth are the minute ossicles of the ear. The difference between the fœtus and the child in this respect is, however, only one of degree.

During pregnancy, a temporary organ, termed the placenta (popularly known as the after-birth, from its being thrown off shortly after the birth of the child), is developed on the inner wall of the uterus (see *b* in the figure). This organ is mainly composed of vessels, and there proceeds from it the structure known as the umbilical cord, *a*, in which lie the umbilical vein, which conveys arterial blood to the fœtus, and the two umbilical arteries, which return the blood to the placenta. This umbilical cord conveys these vessels to the umbilicus, or navel. Before tracing the course of the blood through the fœtus, we must notice the chief anatomical peculiarities presented by the vascular or circulating system before birth.

1. In the heart, we find a communication between the two auricles by means of an opening termed the *foramen ovale*. 2. In the arterial system, we have to notice first, the *ductus arteriosus* (see *r* in the figure), which is a large communicating trunk between the pulmonary artery and the descending aorta; and, secondly, the branches given off by the internal iliac arteries, which go under the name of hypogastric as long as they are within the body of the fœtus, and of umbilical when they enter into the structure of the cord, are continued from the fœtus to the placenta, to which they return the blood which has circulated in the fœtal system. 3. In the venous system there is a communication between the umbilical vein and the inferior vena cava, called the *ductus venosus*.

Pure blood is brought from the placenta by the umbilical vein, which passes through the umbilicus, and enters the liver, where it divides into several branches, *d*, *d*, which are distributed to that viscus, the main trunk or *ductus venosus*, *e*, passing directly backwards, and entering the inferior vena cava, *f*. The pure blood here becomes mixed with the impure blood which is returned from the lower extremities and abdominal viscera, and is carried into the right auricle, *h*, and from thence, guided by the Eustachian valve (which is situated between the anterior margin of the inferior cava, and the auriculo-ventricular orifice, and is of relatively large size in the fœtus), passes through the *foramen ovale*, into the left auricle, *i*. From the left auricle, it passes into the left ventricle, and into the aorta, whence it is distributed by the carotid and subclavian arteries principally to the head and upper extremities, which thus receive comparatively pure blood. From the head and arms, the impure blood is returned by the superior vena cava to the right auricle; from the right auricle, it is propelled, as in the adult, into the right ventricle; and from the right ventricle, into the pulmonary artery. In the adult, it would now pass through the lungs, and be oxygenised; but in the fœtus, it passes through the *ductus arteriosus* into the commencement of the descending aorta, where it mixes with that portion of the pure blood which is not sent through the carotid and subclavian arteries. Some of this mixed blood is distributed by the external iliac arteries, *u*, *u*, to the lower extremities, while the remainder (probably the larger portion) is conveyed by the hypogastric or umbilical arteries, *t*, to the placenta.



The Fœtal Circulation (from Wilson's *Anatomist's Vade Mecum*):

a, the umbilical cord proceeding from *b*, the placenta; *c*, the umbilical vein; *d*, *d*, its branches going to the liver; *e*, the *ductus venosus*; *f*, the inferior vena cava; *g*, the portal vein; *h*, the right auricle. The uppermost arrow indicates the course of the blood through the *foramen ovale*. *i*, the left auricle; *k*, the left ventricle. The arrow commencing in the left ventricle, and with its head on the ascending aorta, indicates the course of the blood to be distributed to the head and extremities; *l*, the arch of the aorta. The arrows *m* and *n* represent the return of the blood from the head and upper extremities, through the jugular and subclavian veins, to the superior vena cava, *o*, to the right auricle, *p*, and, as shewn by the arrow, through the right ventricle, *k*, to the pulmonary artery, *q*; *r*, the *ductus arteriosus*; *s*, *s*, the descending aorta; *t*, the hypogastric or umbilical arteries; *u*, *u*, the external iliac arteries.

From the above description we perceive—1. That a considerable quantity of the pure blood from the placenta is at once distributed to the liver, which accounts for its large size at birth as compared with the other viscera. 2. That a double current meets in the right auricle, one stream, guided by the Eustachian valve, passing through the *foramen*
ovale into the left auricle, the other thr
auriculo-ventricular opening into the right v
3. That the comparatively pure blood sent
head and arms, as contrasted with the impu
sent to the lower extremities, causes the r
greater development of the former an
prepares them for the functions they
upon to perform; the development of
birth being slight as compared with that of
or arms.

Almost immediately after birth, the *foram*

or portions of lungs, that have r
that fluid.

In the preceding remarks, we
months as the full period of fœtal
period of gestation is, however, c
between certain limits, and it is of
importance in reference to questions of
legitimacy to determine these limits.

The average duration of gestation in the
female is comprised between the 38th a
weeks after conception. It is comparatively
that the actual date of conception can be fix
positive certainty; but amongst the few
this kind on record, Rigby mentions one
natural labour came on in 260 days, and
mentions another in which it did not
until the lapse of 293 days. Here, then,
an unquestionable range of 33 days;
apparently authentic cases are on record in
a longer period of gestation than in Reid
has been observed.

Another important question in connection
this subject, is—What is the earliest period at
a child can be born, to enable it to live,
continue in life after its birth? There is
that children born at the seventh month
are capable of living, although they
much care; and children may be born a
period between the sixth and seventh
even in some instances earlier than the
this is rare, and if born living, they com
soon after birth. Various cases of this
collected by Dr Taylor in his *Medical Jur*
amongst others, he mentions a case rep
Barker of Dumfries, in which a child
the 158th day of gestation, and (the

was held exclusively by the common
rather that it was open to freemen of all ranks and conditions, and that the possession of it was much coveted even by those who held great estates on the hereditary title which was known as *Bockland* (q. v.). Folcland was often given out as bockland to those who had performed great public services, just as Horatius was rewarded by a grant of the Roman *ager publicus*—

'They gave him of the corn-land
That was of public right,
As much as two strong oxen
Could plough from morn till night!'

It was also frequently given to the church, for the purpose of founding monasteries and the like, a practice of which Bede complains in his celebrated letter to Archbishop Egbert. 'It is disgraceful to say, persons who have not the least claim to the monastic character, as you yourself best know, have got so many of these spots into their power, under the name of monasteries, that there is really now no place at all where the sons of nobles or veteran soldiers can receive a grant.'—Kemble's *Saxons*, p. 291. Kemble gives examples of the dues paid by monasteries for the folcland which they held, which afford curious information as to the products of industry and modes of living of those times. In 883, a monastery is freed from all dues which the monks were still bound to pay to the king's hand, including bright ale, beer, honey, oxen, swine, and sheep. The dues of the monastery at Taunton were a feorm (or entertainment) of one night to the king, and eight dogs and one dog-keeper; and nine nights' keep for the king's falconers, and carriage, with wagons and horses, for whatever he would have taken to Curry or Wilton; and if strangers came from other parts, they were to have guidance to the nearest royal vill upon their road. *Ib.* 295, 296.

FOLDVAR, a town of Hungary, in the county of Tolna, is situated on the crest and slope of a hill on the right bank of the Danube, 48 miles south of Pesth. It has a Roman Catholic high school, is a steam-boat station, has an important sturgeon-fishery, and considerable trade in wines and agricultural produce. Pop. 11,758.

FOLIA MALABATHRI, i. e., Malabar Leaves, formerly in much repute as a medicine; an aromatic tonic; the dried leaves of *Cinnamomum nitidum*, and partly of *C. Tamala*, species of cinnamon, small Indian trees or shrubs.

FOLIATION, a term restricted by Mr Darwin, and subsequently by geologists, to the alternating layers or plates of different mineralogical nature, of which gneiss and some other metamorphic schists are composed. It differs from cleavage, which is applied to the divisional planes that render a rock fissile, although it may appear to the eye quite or nearly homogeneous; and from lamination, which is the easy splitting of a rock into its original layers of deposition. It is difficult to determine the cause of foliation. Some hold that as gneiss is composed of the disintegrated ingredients of granite, the layers are identical with the original laminæ, having been arranged according to their various densities. But it can scarcely be conceived that water would be able to deposit such materials in the same order over areas so immense as those occupied by gneiss strata. It seems more probable that the arrangement is owing to some widespread metamorphic and segregating force, which operated subsequently to the deposition of the beds.

FOLIGNO, a town of Central Italy, in the province of Perugia, in the fruitful valley of the Topino, 18 miles north of Spoleto. It was formerly surrounded by walls, which have now especially on a dangerous coast. The ringing of church-bells, and of bells at the coast-guard stations, has been suggested; but there is one serious difficulty here, viz., that when most needed, that is, when a strong wind is blowing in towards the shore, such sounds would be heard only at a very little distance out at sea.

The fog-signals used on railways are small cases charged with detonating powder, and laid upon the rails. They explode loudly when the wheel of an advancing train comes upon them. They are not merely used in fogs, but in all cases of danger, from obstruction of the line, or in other cases of urgency when a train has to be stopped without delay. Station-masters and railway police are furnished with them for the purpose of thus stopping a train at any place.

FÖHR, one of the greater of the islands in the North Sea, on the western coast of the province of Slesvig; its central point is in lat. 54° 42′ N., and in long. 8° 30′ E. It has an area of about 28 square miles, has about 5000 inhabitants, and is divided into *Osterlandfohr*, which always belonged to Slesvig, and *Westerlandfohr*, ceded by Denmark to Slesvig in 1864. The inhabitants are mostly Frisians, who live by taking fish and wild fowl, and by the manufacture of cheese and stocking-ware. The chief place is a bathing-place, called Wyk, with a population of 1000.

FOIL, a thin bar of elastic steel, mounted as a Rapier (q. v.), but without a point, and additionally blunted at the end by the presence of a button covered with leather. It is used in Fencing (q. v.).

FOIL (from *folium*, a leaf), a general name for thin metal intermediate in thickness between *leaf-metal*, such as gold, silver, and copper leaf, and *sheet-metal*.

There are two distinct kinds of foil in common use—the tin-foil used for silvering looking-glasses, lining tea-caddies, and other similar purposes, and for the conducting coatings of electrical apparatus; and the bright foils employed by the jewellers for backing real or artificial gems, and thereby increasing their lustre or modifying their colour.

The former is made by rolling out tin, or more recently, by the method of Mr Wimshurst, who casts a cylinder of the metal, and then, by means of a knife or cutter, shaves it into a sheet as the cylinder rolls to the knife, which is gradually moved inwards towards the axis of the cylinder at a rate proportionate to the required thickness of the sheet.

The bright foil used by jewellers and for theatrical and other ornaments under the name of 'tinsel,' is made of copper, tin, tinned copper, or silvered copper. The last is now chiefly used by jewellers. The metal is rolled in a flatting mill, and the requisite brilliancy of surface is produced by finishing between burnished rollers and polishing. The various colours are produced by coating the white metal with transparent colours mixed in isinglass size. A similar varnish without colour is laid over the white foil, to prevent tarnishing. The socket or setting in which the stone or paste is mounted is lined with the foil, and by reflecting from the internal facets the light which passes through the stone, adds considerably to its brilliancy. The natural colours of real stones are sometimes heightened or modified by coloured foil, and factitious colours are thus given to the glass or 'paste,' as it is called, of which spurious gems are made.

There are two other methods of foiling gems, distinct from the above: one of them is to line the socket of the setting with tin-foil, then fill it whilst
warm with mercury; after a few minute
mercury is poured out, and there remain
gam of tin, precisely the same as is use
ing common mirrors; the gem is fitted
and thus its back has a mirror surface.
method is to precipitate a film of pu
silver upon the back of the stone, by su
solution of the ammonia nitrate of silver
with the stone to the reducing action
of cassia and cloves. The silvering
glasses being the chief use to which th
tin-foil is applied, its purity is a matte
consideration; its employment also by c
a ready means of forming some of the tin
renders this absolutely necessary.

Nevertheless, the spirit of adu
extended to the tin-foil makers, and
extensively alloyed with the tin. In som
recently made, it has been shewn that
85 per cent. of the adulterant metal has
the effect of which in the process of silveri
is most injurious to the brilliancy of the
which should consist of perfectly pure tin
silver. For chemical purposes, it is now
necessary to test for lead before using tin

It seems more probable that the arrangement is owing to some widespread metamorphic and segregating force, which operated subsequently to the deposition of the beds.

FOLIGNO, a town of Central Italy, in the province of Perugia, in the fruitful valley of the Topino, 18 miles north of Spoleto. It was formerly surrounded by walls, which have now been converted into promenades. It has regular streets, and some important buildings, including the beautiful cathedral, the theatre, the Palazzo Communale, the hospital, and several churches. Raphael's Madonna di Foligno, now in the Vatican, formerly hung in a convent here. The manufactures are woollens, paper, and wax-candles. Pop. 13,000.

F., the ancient Umbrian *Fulginium*, was called in the middle ages Fulignum. In 1832 it suffered severely from an earthquake.

FOLKES, MARTIN, LL.D., an eminent English scholar and antiquary, born at Westminster in 1690, was educated at Clare Hall, Cambridge. In 1713, he was chosen a fellow of the Royal Society of London; and in 1741 he succeeded Sir Hans Sloane as president of that learned body. He was also a member of the Antiquarian Society, and of the Royal Academy of Sciences at Paris. He died in 1754. F. was the author of *A Table of English Gold Coins from the 18th Edward III., when Gold was first coined in England* (Lond. 1736, 4to), with *A Table of English Silver Coins, from the Norman Conquest; to which is added an Appendix, answering the Coins minted in Scotland since the Union of the two Crowns* (Lond. 1745, folio), published under the care of the Antiquarian Society, superintended by Dr Giffard (1763, 2 vols.). Besides these works, F. contributed a number of papers to the *Philosophical Transactions.*

FOLK-LORE, a term recently introduced into English from the German, as applicable to what may be called a department of antiquities or archæology—viz., that which relates to ancient observances and customs, and also ideas, prejudices, and superstitions among the common people. In England, the literature of this subject may be said to have commenced with the *Miscellanies* of John Aubrey, published in 1696, in which we find chapters on Day Fatality, Omens, Dreams, Corpse Candles, Second Sight, and kindred matters, to which that learned but credulous author—an early member of the Royal Society—had given his attention. Here, however, the superstitions, rather than the ordinary observances and customs of the people, were detailed. The first book addressed to the general subject of folk-lore was an octavo volume by the Rev. Henry Bourne, published at Newcastle in 1725, under the title of *Antiquitates Vulgares, or the Antiquities of the Common People.* It mainly consists of an account of the popular customs in connection with the feasts of the church. Fifty years after its publication, John Brand, M.A., a native of Newcastle, busied himself in extending the collections which originated with Bourne, and in 1777 he published at that city the first edition of his *Observations on the Popular Antiquities of Great Britain*, a work which was subsequently enlarged by himself, partly from the stores of folk-lore presented in the *Statistical Account of Scotland* (edited by Sinclair, 1791–1795), but was left to be re-issued, under a thoroughly revised form, in 1813 (2 vols. 4to), by Henry Ellis of the British Museum. This work, in which Bourne's was incorporated, has since been twice reprinted, with additions, and might have been regarded as an exhaustive work on the subject, if it had not been shewn by Hone's *Every Day Book* and *Year Book*, and the useful little periodical entitled *Notes and Queries*, that, after all, many curious particulars of English folk-lore remained to be gleaned. Through all these various channels, we now have tolerably ample information on popular festivals of every kind, both those which appear to have originated in pagan times, and those instituted by the Christian Church, on all observances connected with the important movements of domestic life, as marriages, sepulture, &c.; on fireside amusements, on supersti[illegible] vulgar errors. What may be called a [illegible] of folk-lore has at the same time been [illegible] trated in the *Nursery Rhymes*, edited by [illegible] well, and the *Popular Rhymes of Scotland*, [illegible] Robert Chambers. It is to be observed [illegible] folk-lore has thus been engaging the [illegible] literary men, and put beyond risk of [illegible] taking its place in solid books, it is [illegible] declining among the people th[illegible]lves. [illegible] effect, the diffusion of scien[illegible] favour of the clergy for everyt[illegible] the supernatural except religion i[illegible] industrial changes and improv[illegible] fifty years, including a greatly [illegible] of the people from one district to [illegible] conduced. In the British Islands no [illegible] made to generalise folk-lore for [illegible] nected with anthropology, ethno[illegible] science; but in Germany, as is [illegible] learned brothers, Jacob and Wilh[illegible] turned the ancient simple usage[illegible] of the peasant's fireside to excellent [illegible] illustrating remote periods of the n[illegible]al [illegible]

FOLKMOTE (a meeting or ass[illegible] 'folk' or people) was the term ap[illegible] Saxons to district meetings gener[illegible] Kemble is of opinion that originally [illegible] great meeting of the nation, which [illegible] converted into the Witenagemôte, [illegible] the councillors or representatives of [illegible] (Kemble's *Saxons in England*, ii. p. 196).

FOLKRIGHT, mentioned in the law[illegible] Edward the Elder, is nearly synonym[illegible] common law, or rather with the ri[illegible] common law confers on the people of [illegible]

FOLKSTONE, a rising town of [illegible] south-east coast of Kent, is a mun[illegible] seaport, and bathing-place, and is situated [illegible] east-south-east of London by rail, and [illegible] west-south-west of Dover. It stands [illegible] ground at the foot of a range of hills. [illegible] part lies in a narrow valley, crossed [illegible] ficent railway viaduct. It has rap[illegible] and improved since the opening o[illegible] eastern Railway, and the establishme[illegible] packets from this town to Boulogne, [illegible] the south-east. Between the two [illegible] submarine chain of rocks only 14 [illegible] low water. Pop. (1871) 12,698. [illegible] Hythe in returning one member to [illegible] The harbour is much used by bo[illegible] herring and mackerel fisheries. [illegible] pier extends from Shakspeare C[illegible] Fairlight Head, at Hastings; the Boul[illegible] are also seen. In the vicinity are [illegible] Roman intrenchments. Here Harvey, [illegible] coverer of the circulation of the blood, wa[illegible]

FOMENTATION (Lat. *fomentatio*; from *foveō*, I bathe), an application of [illegible] moisture to a part, by means of cloths [illegible] of hot water, sometimes medicated [illegible] infusions of substances calculated to [illegible] or stimulate the surface. Thus, opium, [illegible] chamomile, turpentine, &c., are used in va[illegible] in connection with fomentations, which [illegible] great service in the treatment of alm[illegible] local disorders.

FONBLANQUE, ALBANY, [illegible] 1797, was intended for the ba[illegible] pupil of Chitty, the eminent special ple[illegible] reagh's Six Acts made him a politic[illegible] editor of the *Examiner*, [illegible] then [illegible] weekly journal, F. exhibit[illegible] of wit and intellect, and [illegible] on public opinion between the years Leigh Hunt, who was his pre- editorship of the *Examiner*, says of Autobiography, 'He was the genuine of me, but of the Swifts and Addisons ves; profuse of wit even beyond them, and in political knowledge.' The characteristics political writings may be gathered from his entitled *England under Seven Administrations* which is simply a reprint of the more leading articles published in the *Examiner* period of the Canning and Goderich to the return of the Melbourne ministry. vices to the Whigs were rewarded by his to the office of secretary to the Department of the Board of Trade in afterwards became head of the same and comptroller of corn returns, under ency of the Hon. John Bright; which held till his death on 14th October 1872.

D DU LAC is a name of various application portion of the United States which originally to French Canada. Primarily denoting the extremity of any great body of fresh water, secondarily, been made to indicate adjacent of different kinds, chiefly in connection ke Superior, the grand reservoir of the St and Lake Winnebago, which empties itself westward into Lake Michigan.—1. The Lac of Lake Superior has lent its appella- village in Minnesota, situated at a distance 20 miles, on its navigable tributary, the —2. DI (anciently *Fundi*), a small town of the north-west of the province of Caserta, six miles from the coast, on the Appian hich now forms its principal street, 56 miles of Naples. It is an ill-built, dirty, and town, in the neighbourhood of a pesti- (the ancient *Lacus Fundanus*); the sur- however (the ancient *Cæcubus Ager*, the famous Cæcuban wine of classic very fruitful. F. is surrounded in part by cyclopean structure, and has a population who are said to be in the highest degree lawless.

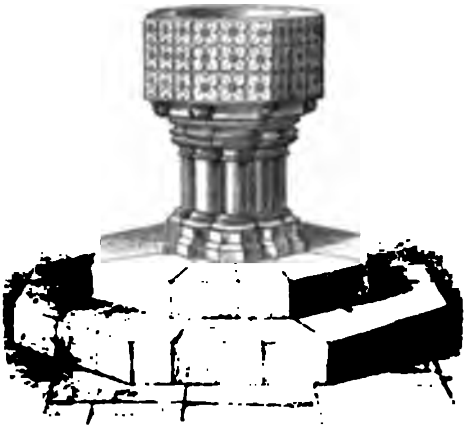
CA, a bay on the Pacific coast of Central between the two states San Salvador It claims notice principally as the inus of an interoceanic railway from Caballos in Honduras. The inter- ntry has been surveyed, and reported as

(*Fons Baptismalis*), the vessel used in as the repository of the baptismal water. period, while immersion continued ordinary rite of the administration of nt of baptism, the baptistery (see or other place set apart for the was furnished with a basin sufficiently to admit of the administration of the rding to the then prevailing form. But became customary to baptize by affusion—by pouring the water on the head of the o be baptized—the size of the basin was nished, and eventually it assumed and the form which are now in most of the medieval churches Britain and upon the continent. The baptismal font, in its normal form, consists of a basin or cup, more or less capacious, hollowed out of a solid block, and supported upon a stem or pedestal. It is ordinarily of stone, but some ancient examples of leaden fonts also occur, and a few of copper or of bronze. In general, however, it may be said that the font, in its external form and character, followed the prevailing style of ecclesiastical architecture and ornamentation. From its connection with one of the most solemn rites of religion, it became very early a favourite subject for the exercise of the decorative skill of the artist, and there are still preserved in different churches fonts which exhibit characteristics of each and all the successive fashions through which church architecture has passed since the introduction of the font in its present form. There is some doubt as to whether any existing specimen in England really belongs to the Saxon period, but examples are found of all the later styles, from the Early Norman down to the latest revival of Gothic architecture in our own day; the Early English, the Decorated, of which a beautiful example occurs in the church of All Saints, Norwich; and the Perpendicular, which is seen in its highest perfection at East Dereham in the same county of Norfolk. The annexed engraving exhibits a highly characteristic specimen of the fonts of the beginning of the 14th c., which stands in the church of Swaton, Lincolnshire, erected about 1310.



Font.

The external figure of the basin seems to have been originally circular or elliptical; but most of the later fonts are hexagonal, or even eight-sided. The basin was commonly supported on a single pillar or stem. Many cases, however, occur in which it rests on three, four, or five pillars, or, as in the engraving, on a group of pillars or pilasters united into a solid stem. The exterior, as well of the basin as of the pedestal, was often highly decorated, ordinarily with sculpture, but occasionally also in gold and colours; the designs on the basin commonly representing subjects connected with baptism, or its types and symbols. We frequently meet around the pedestal figures of the apostles, sometimes only eleven in number, Judas being omitted.

In the Roman Catholic Church, the service of Easter Saturday contains a solemn form for the blessing of the baptismal font. After a long series of prayers, and amid a very imposing ceremonial, the 'chrism,' or consecrated oil blessed by the bishop, and also the so-called 'oil of catechumens,' are mingled with the baptismal water, which is reserved for subsequent use. With a view to the preservation of the water thus reserved, the font, especially when it is of porous stone, is sometimes lined with lead; and from an early date, it is furnished with a lid, which is secured by a lock, and is often of a highly ornamental character.

The ordinary place of the font is at the western end of the nave, near the entrance of the church, but in many cases it stands in a separate chapel or baptistery, or at least in a compartment screened off for the purpose. Even when it stands in the open nave, it is properly enclosed by a rail.

The baptismal font is not to be confounded with the 'holy-water fount,' which usually stands near the entrance of Roman Catholic churches, and from which persons entering sprinkle their forehead, in recognition of the inward purity with which we ought to enter the house of God; nor with the *piscina* or *sacrarium*, which is found in the chancel or the sacristy of ancient churches, and which was intended to receive and carry away the water used in cleansing the sacred vessels, the altar-linens, and the other furniture used in the administration of the eucharist. See Paley's *Illustrations of Baptismal Fonts*; Simpson's *Series of Baptismal Fonts*; Wetser's *Kirchen-Lexicon*; Binterim's *Denkwürdigkeiten.*

FONTAINEBLEAU, a town in France, in the department of Seine-et-Marne, is beautifully situated in the midst of an extensive forest, near the left bank of the Seine, 35 miles south-east of Paris, with which it is connected both by steamers on the Seine, and by railway. There are several fine public buildings, among others, two hospitals—one erected by Anne of Austria, the other by Madame de Montespan. It furnishes a great deal of wine and fruit for the capital, and has manufactures of porcelain. Its grapes are famed as *Chasselas de Fontainebleau.* Pop. (1872) 8952.

F. is chiefly famous for its château, or pleasure-palace of the kings of France, and the forest that surrounds it. The forest covers an extent of 64 square miles, and presents much fine scenery. The château is said to have originally been founded by Robert the Pious toward the end of the 10th century. It was rebuilt in the 12th c. by Louis VII., of whom, and of Philippe Auguste, it was a favourite residence, and was enlarged by Louis IX. and his successors. After being allowed to fall into decay, it was repaired and embellished by Francis I., who here received the Emperor Charles V. with lavish splendour, in 1539. Almost every succeeding king added something in the way of enlargement or embellishment, so that it bears the character and style of almost every century.

In the 17th c., it was the residence of Christina of Sweden after her abdication, and in the *Galerie des Cerfs* she caused her secretary Monaldeschi to be executed. Under Louis XIV. it was occupied by Madame de Montespan, and under Louis XV. by Du Barry; and here Pope Pius VII. was detained a prisoner for nearly two years by Napoleon. Many state transactions and treaties are dated from F.; among others, the act of abdication of Napoleon in 1814. Louis Philippe had all the paintings renovated, and the apartments restored in the taste of the 16th century.

FONTA'NA, Domenico, an eminent engineer and architect, born in 1543 at Mili, in the vicinity of Lake Como. At the age of twenty he joined his brother, also an architect in Rome, and in a brief period achieved a reputation sufficiently brilliant to attract the notice of the magnificent Cardinal Montalto, to whom he was appointed private architect. The pomp of this cardinal seems to have given
umbrage to Pope Gregory XII., who, in co

consul, F. had irritated the republican party by speaking of the French people as *sujets* (subjects). In 1810, he entered the senate. After the fall of Napoleon, he passed into the service of the restored Bourbons, and was raised to the peerage by Louis XVIII. He died 17th March 1821. His various writings, prose and poetic, have been collected and edited by Sainte-Beuve (2 vols., Paris, 1837), and are regarded as models of elegance and correctness.

FONTENAY-LE-COMTE, or **FONTENAY-VENDEE**, a town of France, in the department of Vendée, is situated in a pleasant valley on the right bank of the Vendée, 27 miles north-east of La Rochelle. The streets of the older portion of the town are narrow and tortuous. Its chief ildings are the beautiful Gothic church of Notre me, with a spire 311 feet high; the college, the atre, and the fountain from which the town is to have derived its name. F. has linen manu- ares, tanneries, and a trade in timber, and is an epôt for the victuals and commodities of the h. Pop. in 1872, 6129.

ONTENELLE, BERNARD LE BOVIER DE, an nent French author, was born at Rouen, 11th ry 1657. His father was an advocate, and his a sister of the great Corneille. He began lies in the college of the Jesuits at Rouen, the age of 13, obtained the prize for a Latin During the next three years he professed dy law, but in reality busied himself with the interesting subjects of history, poetry, and sophy. After passing as an advocate, he com- ed to practise, but lost the first cause which conducted, and in consequence renounced the for ever. In 1674, he went to Paris, where he ered upon a literary career, and soon attained to brity and independence. He was a member of ral learned societies; and from 1699 to 1741, the office of Secretary of the Académie des ences, but declined the post of president. F. at Paris 9th January 1757, having nearly ed his 100th year, wittily remarking to his s, as he expired: 'Je ne souffre pas, mes amis; je sens une certaine difficulté d'être' ('I don't my friends; but I feel a sort of difficulty in ny longer'). The greater part of his nume- oetical, historical, oratorical, philosophical, scientific writings, though much admired at the of their publication, have now fallen into ion. He possessed, however, along with great in representation, a poetical turn of mind, and cute intellect. He wrote a few operas, among s, *Psyché*, *Bellérophon*; a musical and dramatic ral entitled *Endymion*; several tragedies *Aspar*, *Idalie*; comedies, fables, fugitive s, epigrams, &c. Of his prose writings, we may n the *Lettres du Chevalier d'Her*, the *Dia- des Morts*, in the manner of Lucian; his *tiens sur la Pluralité des Mondes*, which, much read once, has now become obsolete, quence of the advancement of science; and treatises *Sur l'Existence de Dieu*, *Sur le Bonheur*, *l'Origine des Fables*; and his *Histoire du Théâtre sis jusqu'à Pierre Corneille*, which is still con- F. was particularly celebrated for his *bon-* and for the manner in which he edited the *es de l'Académie des Sciences*, and executed es. It is also perhaps worth mentioning, at the age of 92 he still wrote madrigals! *Œuvres Complètes* have been republished several The most complete edition is that published (3 vols. 1818).

ENOY, a village of Belgium, in the pro- of Hainaut, 5 miles south-west of Tournay, with a population of about 800, deserves mention as the scene of the battle of Fontenoy, one of the most famous contests in the war of the Austrian Succession. The battle was fought 11th May 1745, the opposing forces being the French, 60,000 strong, under Marshal Saxe, and the allies (English, Dutch, and Austrians), in nearly equal force, under the Duke of Cumberland. After a hard-fought fight, the allies were forced to retreat. The loss on both sides was stated at about 7000 men.

FONTEVRAULT (*Fons Ebraldi*), a small town of France, in the department of Maine-et-Loire, 8 miles south-east of Saumur, with a population of (1872) 696, owes its origin to a wealthy and celebrated abbey, now converted into a prison for eleven departments. This abbey was founded by Robert d'Arbrissel, a Breton monk, in 1099, as the residence of a monastic society composed of penitents of both sexes. This society took the name of the *Order of Fontevrault*. It followed the austere rule of Benedict, but had this peculiarity, that the monks were ruled by an abbess, and not by an abbot. The order of F. soon spread through France, and into Spain, and in the former country especially acquired great riches. The abbesses of F. belonged, for the most part, to illustrious families, and were subject only to the popes. At a later period, the strictness of the monastic discipline was relaxed in favour of the nuns, whence, however, in the 14th c., sprung great disorders. Gradually, the order of F. fell into disrespect, but even at the outbreak of the French Revolution it possessed 57 priories in France, which, however, were then abolished along with the other monasteries. The town is of peculiar interest to Englishmen, from the fact that it contains the cemetery of several of the Plantagenet kings of England and of the counts of Anjou. Of these, however, only the tombs of Henry II., of his queen Eleanor of Guienne, of Cœur-de-Lion, and of Isabelle, the queen of John, have been preserved. The old monastic buildings and courtyards, surrounded by walls, and covering from forty to fifty acres, now form one of the larger prisons of France, in which about 2000 convicts of both sexes are confined, and kept at industrial occupations. See an account of this prison in *Chambers's Edinburgh Journal*, 2d series, vol. i. p. 104.

FONTINALIS, a genus of Mosses, allied to *Hypnum*, but having the fruit in the bosom of the leaves, almost without stalk. Several species are British; one of which, the Greater Water-moss (*F. antipyretica*), growing upon rocks and roots of trees in brooks and ponds, is remarkable for the difficulty with which it burns, even when completely dried; on which account it is used in some parts of the north of

Europe for lining chimneys, to protect the adjacent wood-work from fire. Its shoots are a foot or more in length, and branched; they float in the water. The fruit is on the sides of the stems or branches.

FOOD AND DRINK. Although nearly sixty elementary substances are known to chemists, only a comparatively small number of these take part in the formation of man and other animals; and it is only this small number of constituents which are essential elements of our food. These elements are carbon, hydrogen, nitrogen, oxygen, phosphorus, sulphur, chlorine, sodium, potassium, calcium, magnesium, iron, and fluorine.

Carbon, hydrogen, nitrogen, and oxygen are supplied to the system by the albuminous group of alimentary principles (see DIET)—viz., albumen, fibrine, and caseine, which occur both in the animal and vegetable kingdoms, and the gluten contained in vegetables. Animal flesh, eggs, milk, corn, and many other vegetable products, contain one or more of these principles. The gelatinous group also introduces the same elements into the system, when such substances as preparations of isinglass, calves' feet, &c., are taken as food. Carbon, hydrogen, and oxygen are abundantly introduced into the system in the form of sugar, starch (which occurs in large quantity in the cereal grains, leguminous seeds, roots, tubers, &c., used as food), and organic acids (which, as citric, malic, tartaric acid, &c., occur in numerous vegetables employed as food). Carbon with a little hydrogen and oxygen occurs abundantly in the oleaginous group of alimentary principles, as, for instance, in all the fat, suet, butter, and oil that we eat; in the oily seeds, as nuts, walnuts, cocoa-nuts, &c.; and in fatty foods, as liver, brain, &c. Phosphorus is supplied to us by the flesh, blood, and bones used as food (the flesh of fishes is especially rich in phosphoric matter), and in the form of various phosphates, it is a constituent of many of the vegetables used as food. The system derives its sulphur from the fibrine of flesh, the albumen of eggs, and the caseine of milk, from the vegetable fibrine of corn, &c., from the vegetable albumen of turnips, cauliflowers, asparagus, &c., and from the vegetable caseine of pease and beans. Most of the culinary vegetables contain it, especially the *Cruciferæ.* Chlorine and sodium, in the form of chloride of sodium, are more or less abundantly contained in all varieties of animal food, and are taken separately as common salt. Potassium is a constituent of both animal and vegetable food: it occurs in considerable quantity in milk, and in the juice that permeates animal flesh; and most inland plants contain it. We derive the calcium of our system from flesh, bones, eggs, milk, &c. (all of which contain salts of lime); most vegetables also contain lime-salts; and another source of our calcium is common water, which usually contains both bicarbonate and sulphate of lime. Magnesium in small quantity is generally found in those foods that contain calcium. Iron is a constituent of the blood found in meat; and it occurs in smaller quantity in milk, in the yoke of egg, and in traces in most vegetable foods. Fluorine occurs in minute quantity in the bones and teeth. This small quantity is accounted for by the traces of fluorine found by Dr George Wilson in milk, blood, &c.

These simple bodies are not, however, capable of being assimilated and converted into tissue; they must be previously combined, and this combination is primarily conducted by the vegetable kingdom. The number of combined elements varies: thus water contains only two; sugar, starch, fat, and many organic acids, contain three; caseine contains five; and fibrine and albumen contain six.

capsicum (Cayenne pepper), pepper, the various spices, &c., owe their action to the presence of a volatile oil. Sauces are usually fluid mixtures of these condiments with alimentary substances. In a healthy state, condiments and sauces afford little or no nutrition; and although for a time they may stimulate a debilitated stomach to increased action, their continual use never fails to induce a subsequent increased weakness of that organ. Salt and vinegar are the only exceptions. When used in moderation, they assist in digestion; vinegar, by rendering muscular fibre more fluid; and both together, by producing, as Dr Beaumont believes, a fluid having some analogy to the gastric juice (*Experiments and Observations on the Gastric Juice and the Physiology of Digestion*, p. 40, Edin. 1838).

The cookery of foods, although partially noticed in the articles BOILING, BROILING, COOKERY, DIET, &c., requires some general consideration in the present place.

All foods possessing an organised structure, as [illegible]mal flesh and amylaceous substances, require to [illegible] cooked before being eaten, the only exceptions [illegible]ing the oyster and some ripe fruits. The processes [illegible]alting, pickling, and smoking harden the animal [illegible]tures, and, as we shall presently see (at all events [illegible] the case of salting), induce chemical changes [illegible] render the meat less nutritious.

[illegible] ordinary operations of cookery are boiling, [illegible]ing, broiling, baking, and frying.

In the case of vegetables, boiling effects the [illegible]tion of gummy and saccharine matters, the [illegible]ure and partial solution of starch grains, the [illegible]on of albuminous liquids, and the more or [illegible]plete expulsion of volatile oil. In the boiling [illegible]h there takes place a more or less perfect [illegible]n of the soluble from the insoluble con[illegible] according to the duration of the boiling, [illegible]t of water employed, and its temperature [illegible]encement of the operation. If we [illegible] the boiled meat to contain the largest amount [illegible]ishing matter, and disregard the soup or [illegible]at is simultaneously formed, we introduce [illegible] the boiler when the water is in a state of el[illegible]n. We keep up this boiling for a few [illegible] order to coagulate the albumen near the [illegible], and thus to convert it into a crust or shell, [illegible] equally prevents the entrance of water into [illegible]r, and the escape of the juice and soluble [illegible]ts of the flesh into the water. If cold [illegible] then added, so as to reduce the tempera[illegible]out 160°, and this temperature is kept up [illegible] necessary time—for which, in reference to [illegible] of the meat, see the article BOILING—[illegible]nditions are, according to Liebig, united [illegible] give to the flesh the quality best adapted to [illegible] as food.

[illegible], on the other hand, we wish to obtain good [illegible] from meat, we should place it in cold water, bring this *very gradually* to the boiling-point. [illegible] interchange between the juices of the flesh and external water, which was prevented by the [illegible]r process, here takes place without hindrance. [illegible] soluble and sapid constituents of the flesh are [illegible]lved in the water, and the water penetrates the interior of the mass, which it extracts more [illegible] completely. The flesh loses, while the soup [illegible], in sapid matters; and by the separation of [illegible]men, which is commonly removed by skimming, it rises to the surface of the water, when [illegible]lated, the meat loses its tenderness, and [illegible] tough and hard; and if eaten without soup, it not only loses much of its nutritive [illegible]erties, but also of its digestibility.'—Liebig's [illegible]*rches on the Chemistry of Food*, p. 128.

[illegible]sting is applied much more to meat than to vegetables. Both in roasting and broiling meat, the first application of heat should be considerable and rapid, so as to form an outer coating of coagulated albumen (just as in boiling), which retains the nutritive matters within the cooked meat. In roasted meat, nothing is removed but some of the superficial fat and the gravy, which is itself an article of food. The effect of roasting on such vegetables as apples and potatoes is to render them more nutritive and digestible than they would be in the raw state, by splitting their starch grains, and rendering them more soluble.

Baking (q. v.) acts in the same manner as roasting, but meat thus cooked is less wholesome, in consequence of its being more impregnated with empyreumatic oil.

Frying is the most objectionable of all kinds of cookery. In this operation, heat is usually applied by the intermedium of boiling fat or oil. Various products of the decomposition of the fat are set free, which are very obnoxious to the stomachs of invalids.

Liebig has shewn that salted meat is, in so far as nutrition is concerned, in much the same state as meat from which good soup has been made. After flesh has been rubbed and sprinkled with dry salt, a brine is formed amounting in bulk to one-third of the fluid contained in the raw flesh. This brine is found to contain a large quantity of albumen, soluble phosphates, lactic acid, potash, creatine, and creatinine—substances which are essential to the constitution of the flesh, which therefore loses in nutritive value in proportion to their abstraction.

The preservation of food requires some notice. Three methods viz., preservation by cold, preservation by the exclusion of air, and preservation by salting—are noticed in the article ANTISEPTICS. The first is only of comparatively limited application: the second, known as Appert's method, has been successfully used in the English navy for many years; the chief objection to it is its expense: the third method injures, as we have already seen, the character of the meat, and renders it both deficient in nutritive materials, and actually injurious if it forms a principal and continuous article of diet. To these methods we must add preservation by smoking, preservation with sugar, and with vinegar, and preservation by drying. It is well known that meat suspended in smoke loses its tendency to putrefy, the substance from which the smoke derives its antiseptic property being creasote, or some allied body. Smoked meat acquires a peculiar taste, a dark colour, and a somewhat hard consistence; but it retains all its nutritive constituents, and is thus preferable to salted meat. Sugar and vinegar are chiefly employed in the preservation of vegetable products. The most important mode of preserving articles of food, whether animal or vegetable, is by direct drying. Meat is cut up into small slices about a quarter of an inch thick, and vegetables into smaller pieces; they are steamed at a high temperature, so as to coagulate the albumen; and they are then completely desiccated by exposure to a current of very hot dry air. At the conclusion of the process, the slices of meat are quite hard, and present a shrivelled appearance. Dr Marcet (*On the Composition of Food*, 1856, p. 174) speaks in high terms of this method, which he had himself seen in operation in Paris. 'Food thus preserved,' he says, 'whether it be animal or vegetable, has the advantage (1) of remaining in a fresh condition, though freely exposed to the atmosphere for a great number of years, and (2) of being reduced to one-fifth of its original bulk from its having lost all its water.' He adds, that the preserved vegetables resume their bulk when boiled in water, and that they so completely retain their aroma, that it is often difficult to distinguish between soups made with them, and others prepared with fresh vegetables.

The adulteration of food of almost every kind is unfortunately so common a custom, that our limited space will merely allow of our noticing a few of the leading points in regard to it.

Wheat-flour is not unfrequently adulterated with one or more of the following substances—flour of beans, Indian corn, rye, or rice, potato-starch, alum, chalk, carbonate of magnesia, bone-dust, plaster of Paris, sand, clay, &c. The organic matters—the inferior flours and starch—do little or no serious harm; most of the inorganic matters are positively injurious, and of these, alum (one of the commonest adulterations) is the worst. The beneficial action of wheat-flour on the system is in part due to the large quantity of soluble phosphates which it contains. When alum is added, these phosphates are decomposed in the process of making bread, the phosphoric acid of the phosphates uniting with the alumina of the alum, and forming an insoluble compound; the beneficial effect of the soluble phosphates is thus lost.

Arrow-root is adulterated with potato-flour, sago, starch, &c. Out of 50 samples examined by Dr Hassall, 22 were adulterated, and in 10 of the samples there was scarcely a particle of the genuine article.

Sugar of the inferior kinds is occasionally adulterated with flour, gum, starch-sugar, &c. It is oftener, however, impure than intentionally adulterated.

Pepper is adulterated with linseed, mustard-seed, wheat-flour, &c.

Cayenne Pepper is adulterated with red lead, vermilion, red ochre, brick-dust, common salt, turmeric, &c.

Mustard is largely adulterated with ordinary and pea flour, linseed meal, and turmeric; and a little chromate of lead is sometimes added to improve the colour. Dr Hassall submitted 42 specimens of mustard to examination; the whole of them contained wheat-flour and turmeric.

Ginger is frequently adulterated. Out of 21 samples, Dr Hassall found that 15 contained various kinds of flour, ground rice, Cayenne pepper, mustard husks, and turmeric, which in most cases formed most of the so-called ginger.

Out of 26 samples of *mixed spices*, 16 were found by Dr Hassall to contain sago-meal, ground rice, wheat-flour, &c.

Curry powder (q. v.) was found by Dr Hassall to be very commonly adulterated, only 7 specimens out of 26 being genuine. In 8 of the samples red lead was detected. The frequent use of curries may thus often give rise to the disease known as lead-palsy.

The adulterations of *tea*, both by the Chinese and in this country, are too numerous for us to mention. See Hassall's *Adulterations Detected*, pp. 65–104.

Coffee, in its powdered form, is not merely largely adulterated with chicory, but additionally with roasted grain, roots, acorns, saw-dust, exhausted tan (termed croats), coffina (the seeds of a Turkish plant), burnt sugar, and (worst of all) baked horses' and bullocks' liver. In the *Quarterly Journal of the Chemical Society* for April 1856, there is an excellent Report by Messrs Graham, Stenhouse, and Campbell on the mode of detecting vegetable substances mixed with coffee. Even whole roasted coffee is not safe from adulteration, a patent having been actually taken out to mould chicory into the form of coffee berries.

Cocoa and *Chocolate* are adulterated with flour, potato-starch, sugar, clarified mutton-suet, and various mineral substances, such as chalk, plaster of Paris, red earth, red ochre, and Venetian earth, the last three being used as colouring matters.

The adulterations of *beer*, *wine*, and *spirits* are noticed in the articles devoted to those subjects.

Vinegar is adulterated with water, sulphuric acid, burnt sugar, and sometimes with chillies, grains of paradise, and pyroligneous acid. The English law allows one part of sulphuric acid to 1000 of vinegar, with the view of preserving it from decomposition, but Dr Hassall found that in many cases three or four times the legal amount was present. It appears from evidence taken before the parliamentary committee on adulterations, that arsenic and corrosive sublimate are no uncommon ingredients in vinegar. In connection with vinegar we may place *Pickles*. Dr Hassall analysed 16 different pickles for copper, and discovered that poisonous metal more or less abundantly in *all* of them; 'in three, in a very considerable quantity; in one, in highly deleterious amount; and in two, in poisonous amount.' Preserved fruits and vegetables (especially gooseberries, rhubarb, greengages, and olives) are often also contaminated largely with copper. In these cases, the copper, if in considerable quantity, may be easily detected by placing a piece of polished iron or steel in the suspected liquid for 24 hours, to which we previously add a few drops of nitric acid. The copper will be deposited on the iron. Or ammonia may be added to the fluid in which the pickles or fruit were lying, when, if copper is present, a blue tint is developed. We should be suspicious of all pickles, olives, preserved gooseberries, &c., with a particularly bright green tint.

Milk is usually believed to be liable to [illegible]ous adulterations, such as flour, ch[illegible] brains, &c. It appears, however, from [illegible] researches on London milk, that, as a [illegible] water is the only adulteration. The r[illegible] examinations of 26 samples were [illegible] genuine, and that 14 were adulterated, the [illegible]teration consisting principally in the ad[illegible] water, the percentages of which varied from [illegible] per cent., or one-half water. In the [illegible] we shall describe the means of testing [illegible] this fluid.

If space permitted, we might extend [illegible] alimentary substances liable to adulteration [illegible] much greater length. In conclusion, we [illegible] remark, that, as a general rule, adulter[illegible] an organic nature, such as flours and st[illegible] various kinds, are best detected by the mic[illegible] while chemical analysis is usually necessary [illegible] detection of mineral adulterations. Dr [illegible] *Adulterations Detected* is a perfect cyclop[illegible] this subject.

FOOL. See Court-fool.

FOOLS, Feast of. The Romans [illegible] festival of Saturn, in December, as a time of licence and revelry. During the brief season [illegible] Saturnalia (q. v.), the slave reclined on his seat at table, the master waited upon his [illegible] society, for the moment, seemed to be turned [illegible] down. The grotesque masquerade sur[illegible] pagan creed which gave it birth, and not [illegible] its place among the Christians, but, in [illegible] solemn anathemas of fathers and councils, [illegible] way into the ceremonial of the Christian [illegible] It was called, at different times and pl[illegible] many different names, but has latterly [illegible] best known as the Feast of Fools (*Festum* [illegible] *Festum Stultorum*).

The circumstances of the observance w[illegible] infinitely varied, but it was every[illegible] the same spirit of broad, boisterous drollery, and coarse but not ill-natured caricature. The donkey played such a frequent part in the pageant that it was often called the Feast of Asses (*Festum Asinorum*). In some places, the ass of Balaam was figured; in others, the ass which stood beside the manger in which the infant Saviour was laid; elsewhere, the ass on which the Virgin and Child fled to Egypt, or the ass on which Jesus rode into Jerusalem. In every instance, there was more or less attempt at dramatic representation, the theatre being generally the chief church of the place, and the words and action of the drama being often ordered by its book of ceremonies. Several rituals of this sort are still preserved. That which was in use at Beauvais, in France, has a rubric ordering the priest when he dismisses the congregation to bray three times, and ordering the people to bray three times in answer. As the ass was led towards the altar, he was greeted with a hymn of nine stanzas, of which the first runs thus:

Orientis partibus,
Adventavit Asinus,
Pulcher et fortissimus,
Sarcinis aptissimus.
Hé, sire Ane, hé!

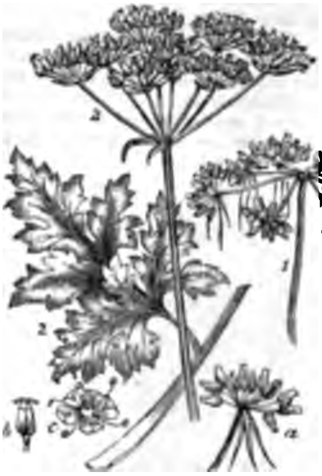
[From the regions of the East—
Blessings on the bonny beast!—
Came the Donkey, stout and strong,
With our packs to pace along.
Bray, Sir Donkey, Bray!]

the ass did not come upon the stage, the point of the farce lay in the election of a mock patriarch, cardinal, archbishop, bishop, or These mimic dignitaries took such titles as e of Fools,' 'Archbishop of Dolts,' 'Cardinal umskulls,' 'Boy Bishop,' 'Patriarch of Sots,' bbot of Unreason,' and the like. On the day of ir election, they often took possession of the rches, and even occasionally travestied the per nce of the church's highest office, the mass, church's holiest place, the altar. In some ts, the nuns disguised themselves in men's chanted mock services, and elected a 'little who for that day took the place of the real

Feast of Fools maintained itself in many till the Reformation in the 16th century. At ibes, in the south of France, it survived till the r 1644, when we have it described by an eye in a letter to the philosopher Gassendi. scene was, as usual, a church; and the actors, ing themselves in priests' robes turned inside read prayers from books turned upside down, spectacles of orange-peel, using coal or incense, amid a babblement of confused and the mimic bellowings of cattle, and ting of pigs.

he history of the Feast of Fools has been treated several works; the best is the *Mémoire pour ir à l'Histoire de la Fête des Fous*, by Du Tilliot, ished at Lausanne in 1741; reprinted at Paris in , and again in the *Recueil des Cérémonies et umes Religieuses de Tous les Peuples*, tome viii. Prudhomme, 1809.)

L'S PARSLEY (*Æthusa Cynapium*), an uliferous plant, very common as a weed in and fields in Britain, and in most parts of , somewhat resembling parsley in its foliage general appearance, so that serious accidents occurred from its being mistaken for that herb; eing a poisonous plant, somewhat resembling k in its properties. With the curled variety rsley it cannot easily be confounded, which is on other accounts to be preferred; and when in flower it is readily known from every other plant in British gardens by its umbels wanting general involucres, and having partial involucres of three slender leaves hanging down on one side.



1, Fool's Parsley, general umbel; 2, Common Parsley, leaf and general umbel:
a, partial umbel of fool's parsley; *b*, fruit of common parsley; *c*, flower of common parsley.

FOOT is the most common unit of lineal measure all over the world. It has been evidently taken originally from the length of the human foot, and as that varies in length, so does the measure; each country, and at one time each town, having a foot of its own. The three foot-measures that occur most frequently are the Paris foot, or *pied de roi*, the (German) Rhenish foot, and the English. Compared with the French *mètre* (= 3·28090 feet Eng.), they stand thus:

		Metre.			Inches English.
English foot	=	0·30479	Paris foot	=	12·78912
Paris "	=	0·32484	Rhenish "	=	12·35652
Rhenish "	=	0·31385			

In round numbers, 46 French feet = 49 English feet, 34 Rhen. or Germ. feet = 35 English, and 57 French feet = 59 Rhen. The Russian foot is equal to the English. Almost every German state has a different foot. The Rhenish foot is that used in Prussia. The longest foot occurring is the old Turin foot = 20 inches English. Many local feet are only about 10 inches. The foot has almost uniformly been divided into 12 inches; the inch into 12 lines, often into tenths. The French *pied usuel* is the third part of the mètre. See YARD, MÈTRE.

FOOT, in Verse. See METRE, VERSE.

FOOT, STRUCTURE OF THE. In describing the structure of the foot, it is expedient to commence with a brief notice of the bones which occur in it. In man, these are 26 in number, and are arranged in three natural groups—viz., the tarsal bones, which are the hindermost; the metatarsal bones, which occupy the middle portion; and the phalanges of the toes anteriorly. The tarsal bones, seven in number, are short and thick, and form the heel and the hinder part of the instep. The uppermost (see fig. 1) is called the *astragalus*, from its supposed resemblance to the dice used by the Romans. Above, it is articulated or is jointed with the two bones of the leg, the *tibia* and *fibula*, and through these bones the whole weight of the body is thrown upon the two *astragali.* Behind, it is connected with and rests upon the *os calcis*, or heel-bone, which is the largest bone of the foot. Immediately in front of it, and supporting it in this direction, is the *scaphoid* or boat-like bone. In front of the scaphoid bone are the three *cuneiform* or wedge bones; and on the outer side of the cuneiform bones, and in front of the os calcis, is the *cuboid* bone. We see from the figure that the front row of tarsal bones is composed of the three cuneiform bones on the inner side of the foot, and of the cuboid bone externally. There are five metatarsal bones passing forward, one for each toe. Each cuneiform bone is connected with one, and the cuboid bone with two, of these metatarsal bones. Behind, they are close together, but as they run forwards, they diverge slightly from one another, and their anterior ends rest upon the ground, and form the *balls* of the toes. They constitute the forepart of the instep. The remaining bones are those of the toes, and are named the *phalanges*, each toe having three of these bones, excepting the great toe, which has only two. (A similar law holds for the bones of the hand, each finger having three phalanges, but the thumb only two.)

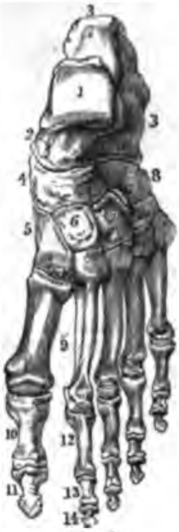


Fig. 1.

The dorsal surface of the left foot.

1, the astragalus, its upper articular surface; 2, its anterior extremity, which articulates with (4) the scaphoid bone; 3, the os calcis, or heel-bone; 4, the scaphoid bone; 5, the internal cuneiform bone; 6, the middle cuneiform bone; 7, the external cuneiform bone; 8, the cuboid bone; 9, the metatarsal bones of the first and second toes; 10, 11, the first and second phalanges of the great toe; 12, 13, 14, the first, second, and third phalanges of the second toe.

The instep is composed of the seven tarsal and the five metatarsal bones, which are so arranged and connected (see fig. 2) as to form an arch from the extremity of the heel-bone to the balls of the toes. This is called the plantar arch, from *planta*, the sole of the foot. The astragalus forms the summit or keystone of this arch, and transmits the weight which it receives posteriorly to the heel, and anteriorly to the balls of the toes. This figure exhibits the arrangement of the fibres and laminæ in the interior of the bones, and shews that the greater number of them, in each bone, follow the directions of the two pillars of the arch, and thus give the greatest strength to the bones in the directions in which it is most required.

The bones, where they articulate with on are covered with a tolerably thick layer elastic cartilage, and by this means, tog the very slight movements of which ca

Fig. 2*

This figure represents a section through the lower end of tibia, and through the astragalus D, the heel-bone F, scaphoid bone E, the internal cuneiform bone, and the b of the great toe; A represents the plantar ligament, the interior calcaneo-scaphoid ligament passing from heel-bone, F, to the scaphoid, E; C is one of two small b called sesamoid bones, usually found at the ball of great toe. The lines shew the disposition of the lamina plates of which the various bones are composed. The line along the contiguous edges of the bones represents cartilage.

capable, a degree of elasticity is given to and consequently to the step, which woul gether wanting if the plantar arch were c of one single mass of bone. This elastici greater in the anterior pillar of the arch, w composed of five comparatively long bones gradually to the ground, than in the posterio which is short, narrow, and composed of a bone, which descends almost vertica from ankle to the ground. Hence, in jum height, we always endeavour to alight upo of the toes, and thus break the shock should feel if, by accident, we descended upon heels.

A reference to any standard work on (see, for example, Gray's *Anatomy*, pp. will shew that the ligaments which bones to one another, and by which the of each bone upon the others are numerous. We shall merely notic ligaments, selecting those whose acti is obvious in maintaining the shape arch. One, the *plantar ligament* (A, strength, passes from the under heel-bone, near its extremity, forw of the metatarsal bones, according (*The Human Foot and the Human* 25). Most anatomists do not trace forwards. 'In other words' (we Humphry's volume), 'it extends between points of the two pillars of the arch holding them in their places, and prev being thrust asunder when pressure is the key-bone (D), just as the "tie-b resists the tendency to outward sides when weight is laid upon the ligament, however, has an advantage beam can ever possess, inasmuch as muscular fibres are attached alo of its upper surface. These instan demand that is made upon them, contraction directly the foot ton and the force of their c to the degree of pressure which is made upon the foot. In addition to its office of binding the bones in their places, the ligament serves the further purpose of protecting from pressure the tender structures—the blood-vessels, nerves, and muscles—that lie above it in the hollow of the foot. Another very strong ligament (B, in the figure) passes from the under and fore part of the heel-bone (F) to the under parts of the scaphoid bone (E). It underlies and supports the round head of the astragalus, and has to bear a great deal of the weight which is transmitted to that bone from the leg. It possesses a [illegible] which the ligament just described, and [illegible] have not—viz., elasticity. This is [illegible] for it allows the head of the key-[illegible] descend a little, when pressure is made [illegible] forces it up again when the pressure is [illegible] and so gives very material assistance to [illegible] provisions for preventing jars, and for ease and elasticity to the step.'—Humphry, pp. 25, 26.

---

* This, and several of the f been copied, with Dr Humph *Human Foot and the Human*

[illegible] spot over which the ligament B extends is [illegible] weakest in the foot, the astragalus being there [illegible] ported by any bones; additional support is, [illegible] ever, afforded when it is most required by the [illegible] on of a strong muscle, the *posterior tibial* (fig. 3, [illegible] which passes from the back of the tibia (the [illegible] bone of the leg) round the inner ankle, to be [illegible] rted into the lower part of the inner surface of [illegible] scaphoid bone. It not unfrequently happens [illegible] the astragalus, being either insufficiently sup-[illegible] ted, or from its being overweighted, descends [illegible] tly below its proper level, causing a lowering [illegible] arch, and a flattening of the sole of the [illegible]. The defect, when slight, is known as 'weak [illegible];' when more decided, it is termed 'flat-[illegible],' and in extreme cases, the bone may descend [illegible] such an extent as even to render the inner side [illegible] foot convex, when it naturally should be [illegible].

[illegible] deformity of which we are speaking is of such [illegible] practical importance, that we shall add a few [illegible] about its most common causes.

[illegible] re are two periods of life at which *flat-foot* is [illegible] ally liable to occur: 1st, in infancy, if the [illegible] be put upon its feet before the bones and [illegible] ments—especially the latter—are strong enough [illegible] bear its weight; and 2dly, about the age of [illegible] teen—a period at which growth is very quick, [illegible] the body consequently attains a considerable [illegible] rapid augmentation of weight. If young [illegible] sons of this age are obliged to be a great deal [illegible] ir feet, and perhaps additionally to carry [illegible] s (as, for example, butchers' and bakers' boys, [illegible] young nursemaids), the chances that flat-foot [illegible] occur are increased.

[illegible] now come to the movements of the foot upon [illegible] leg. We see here a striking combination of [illegible] iety of movement with general security. This [illegible] bination is effected by the harmonious action [illegible] three joints, each of which acts in a direction [illegible] ent from the others.

[illegible] first of these joints is the ankle-joint, which [illegible] formed by the bones of the leg—the tibia and [illegible] la—above, and the astragalus below. By this [illegible] the foot is bent or straightened on the leg. [illegible] second joint is between the astragalus and the [illegible] bone, and it permits the foot to be rolled [illegible] ards or outwards; while the third joint is [illegible] ween the first and second row of tarsal bones [illegible] ely, between the astragalus and heel-bone [illegible], and the scaphoid and cuboid bones in front, [illegible] allows the degree of curvature of the plantar [illegible] to be increased or diminished within certain [illegible]. The following is the order in which the [illegible] nts of these three joints occur: the raising of the *heel* (by the first joint) is accompanied by a rolling of the foot *inwards* (by the second joint), and by an increased *flexure* of the plantar arch (by the third joint); and the raising of the *toes* is accompanied by a rolling of the foot *outwards* and a *straightening* of the sole. See Humphry, *op. cit.*, p. 42.

The joints, however, merely allow of movements; they do not effect them: this is the special function of the muscles; and each of the three movements

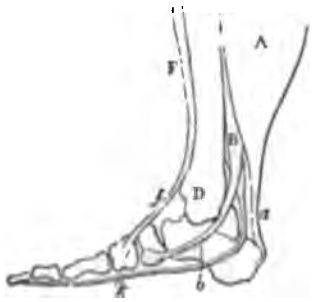

Fig. 3.

This figure represents some of the muscles and tendons seen on the inner side of the leg and foot.

A, the gastrocnemius and soleus muscles, forming the muscles of the calf; *a*, the Tendo Achillis: B, the posterior tibial muscle; *b*, its tendon: D, the inner ankle: F, the anterior tibial muscle, attached above to the front of the tibia, below to the internal cuneiform bone; *k*, the flexor tendon of the great toe.

we have indicated is effected by special groups of muscles. The first series of movements is mainly effected by three muscles: viz., (1) the *muscles of the calf* (fig. 3, A), attached above to the bones of the thigh and leg, and below by the *Tendo Achillis* to the heel-bone; (2) the *posterior tibial* (fig. 3, B), attached above to the tibia, and below by its tendon to the scaphoid bone, and (3) the *short fibular* (fig. 4, C), attached above to the fibula, and below by its tendon to the outer metatarsal bone. The calf-muscles, whose tendon is inserted into the heel-bone, are la[illegible] and very powerful, for in raising the heel, the[illegible] ave to [illegible] the we[illegible]t of the body. The other [illegible] rior

Fig. 4.

This figure represents some of the muscles and tendons on the outer side of the leg and foot.

F, lower end of fibula, forming the outer ankle; C, the short fibular muscle, attached above to the fibula, and below by its tendon (*c*) to the outer metatarsal bone; I, the long fibular muscle, its tendon (*i*) running behind the outer ankle and under the instep to the metatarsal bone of the great toe; G, the anterior or third fibular muscle, attached above to the fibula and below by its tendon (*g*) to the outer metatarsal bone; *h*, the extensor tendons of the toes.

tibial and the short fibular, turn round the inner and the outer ankle respectively, and are inserted into the inner and the outer edges of the instep; the former being attached to the scaphoid, and the latter to the outer metatarsal bone. They not only assist to raise the ankle, but support it laterally. The muscle whose tendon is on the inner side of the foot (the posterior tibial), effects the two movements which are associated with the raising of the heel-bone, namely, the turning of the foot inwards, and the increased flexure of the arch.

The second series of movements—the raising of the toes, the turning of the foot outwards, and the straightening of the sole—are effected by two muscles, the *anterior tibial* (fig. 3, F) and the *third fibular* (fig. 4, G), whose tendons pass, one in front of the inner ankle, and the other in front of the outer ankle, to the corresponding edges of the instep, and are inserted into the internal cuneiform and the outer metatarsal bones. These muscles are direct flexors of the tarsus upon the leg; the former raising the inner, and the latter the outer border of the foot.

Another point in the anatomy of the foot that requires notice, is the mode of union of the metatarsal with the tarsal bones. In these joints in the fourth and fifth toes a slight revolving motion can take place, which probably enables the outer metatarsals to adapt themselves to inequalities of the ground, and to equalise the distribution of the weight which is thrown upon the foot; while, in the corresponding joints of the three inner toes, scarcely any motion can occur—a provision by which additional strength is given to the inner side of the foot upon which the weight of the body most directly falls.

The skin of the sole is very tough and strong; and intervening between it and the bones and long plantar ligament is a thick pad of fat, which acts the part of an air or water cushion in defending the adjacent parts from injurious pressure, and in deadening the jars and shocks that would otherwise be felt in leaping, &c.

A few remarks on the subject of shoes may here be added. The shape of the sole of the natural foot is shewn in fig. 5, while the shape after the prolonged use of a badly made shoe is given in fig. 6. In the foot in its normal state, the great toe is seen to be free from the others, and the line of its axis prolonged backwards, passes through the centre of the heel; while in the foot distorted by the use of the shoe, the line of the great toe is quite altered, and the toes generally—not being able to find room side by side—overlap each other, and lose their separate and individual actions; corns, bunions, and ingrowing toe-nails being the natural conseque maltreatment. Professor Meyer, of Zurich, attention to the bad treatment which receives from ordinary shoemakers, in a p translated by Mr Craig, and entitled *Why Pinches; a Contribution to Applied Anato* especially points out that the great toe s allowed to have its normal position, and th done by making the inner edge of the so *inwards*, instead of *outwards*, from the ball toes. The accompanying figure (7) gives line of a shoe designed under Dr Meyer intendence, and shews the difference be and the usual shape; the latter being by the dotted outline. Dr Humphry, fr admirable work we have drawn much of th while fully according in Meyer's views, ally protests against high heel-pieces, as te make the step less steady and secure, to it, and to impair the action of the cal a high heel-piece, moreover, places the f the foot at a lower level than the heel; the is thus thrown too much in the directio toes, and they are thrust forwards and against the upper leather of the shoe.

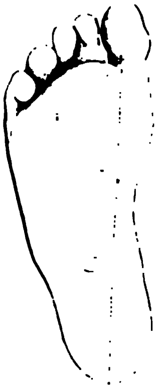

Fig. 5.

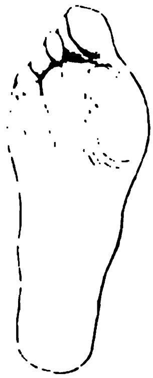

Fig. 6.

The subjects of WALKING, RUNNING, and J are noticed in the article GYMNASTICS.

If we compare the human foot with the other mammals, we find that it presents peculiarities, all of which have reference erect posture. The chief peculiarities are— greater relative size of the tarsal bones, as with the other bones of the foot, and the fect formation of the plantar arch, which and stronger than in any of the lower Strength and elasticity are thus combin human foot in the highest degree. 2. toe is remarkable in man for its size and and for the firm manner in which its bone is joined to the other bones, so as to the main support to the foot. 3. If we the human foot with that of the gorilla or any anthropomorphous ape, we see that the ta short and small in man in relation to the parts of the foot, while in the gorilla the ta the greater part of the foot. Indeed, a ref fig. 8 shews that in this animal (and the sa case in all the *genera* of apes and monkeys) the in question is rather a *hand* than a *foot*, and the term *quadrumanous*, as applied to this of animals. There is scarcely any plantar arch

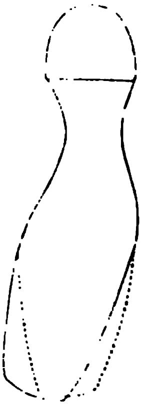

Fig. 7.
A shoe designed by Dr Meyer, the dotted outline being the usual shape.

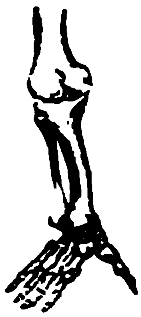

Fig. 8.
Foot of Gorilla.

the weight of the body bears chiefly on the outer edge of the foot; the digits are long and strong, and the inner one diverges so as to form a thumb rather than a great toe.

It remains to notice some of the most marked varieties of form which the bones of the foot present in mammals. In the following group of figures, the same letters are attached to the same

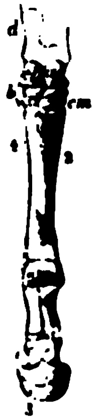

Fig. 9.—Horse.

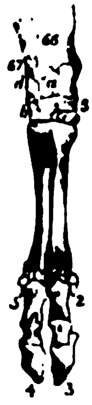

Fig. 10.—Ox.

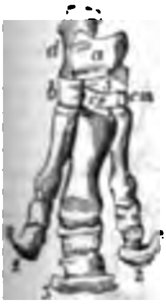

Fig. 11.
Rhinoceros.

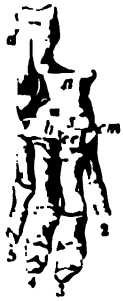

Fig. 12.
Hippopotamus.

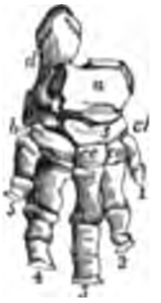

Fig 13.
Elephant.

nes. Thus, a marks the astragalus; cl, the caneum or heel-bone (the posterior projection which forms the hock of the horse); s, the oid; b, the cuboid; ce, the ecto-, or outer, the meso-, or middle, and ci, the ento-, or nal cuneiform. Now, as a general rule in all nalia, the ecto-cuneiform supports the third or of the five toes when they are all present, meso-cuneiform the second, and the cuboid the h and fifth. Bearing in mind this law, we t the large bone in the horse, known as cannon-bone, which is articulated to the ecto-rm, ce, is the metatarsal of the third toe, to are articulated the three phalanges of that last phalanx, 3, being expanded to form oof. The small bone,* popularly known as the bone, and articulated to the meso-cuneiform, rudimentary or stunted metatarsal of the toe, 2; and the outer splint-bone, articulated cuboid, is the rudimentary metatarsal of the toe, 4; so that in the horse we have only one e third, sufficiently developed to reach the nd, with mere traces of a second and fourth n either side.

the foot of the ox, the cuboid, b, is relatively larger than in the horse, and is equal in size to the ecto-cuneiform, ce. The cannon-bone articulates with both these tarsal bones, and hence answers to the metatarsal bones of both the *third* and *fourth* digits; it is accordingly found to consist of two distinct bones in the fœtus; and in the adult it is divided internally into two cavities, and its original separation is marked out by an external elongated ridge. At the lower end are two distinct joints for the phalanges of the third and fourth toes. While in the horse we had the rudiments of the *upper* parts of two toes (the second and fourth), in the ox we have the rudiments of the *lower* parts or phalanges of two toes (the second and fifth), forming the 'spurious hoofs,' and marked 2 and 5 in the figure. In the rhinoceros there is one principal toe (the third), as in the horse, with the second and fourth toes in a less developed state; while in the hippopotamus there are two principal toes (the third and fourth), as in the ox, with the second and fifth toes not fully developed. In the elephant, there is a fifth digit added, answering to our great toe, and articulating with an ento-cuneiform bone, so that in the foot of this animal we have all the bones occurring in the human foot.

Professor Owen, to whose works we are indebted for these remarks, concludes from these and similar observations that the course of the simplification of the five-toed foot is, first, a diminution and removal of the innermost toe; next, of the outermost; then, of the second; and lastly, of the fourth; the third or middle toe being the most constant and (in the lower animals) the most important of the five.

FOOT, in Music, is a term made use of in the same way as in poetry, denoting a short melodic figure of notes with only one accent. Foot is also now beginning to be used in speaking of the pitch of sounds. The Germans have always used the word *Fusston* in representing the pitch of the different stops of an organ, such as *Principal* 16 F., 8 F., or 4 F., &c., which practice is now being introduced into English organs, and is found very useful to organists. The pitch of the stop is fixed according to the length of the lowest C pipe. See ORGAN.

FOOTA-BONDOU. See BONDOU.

FOOTBALL. This game has long been a favourite throughout the British Isles; and as a winter game, is far more popular than any other, especially in our universities and public schools. A large park or common is best suited for the game, one of the most attractive features of which is, that it may be simultaneously enjoyed by great numbers of players, irrespective of age or size. Two 'goals'—consisting each of a couple of upright poles, ten, twelve, or even eighteen feet high, and a cross-bar on top—are erected opposite each other, at any distance that may be agreed upon, the game being carried on in the intervening space. Two side-lines, called goal-lines, are drawn from each of the goals. The players are chosen by two captains, who arrange their men in the field, and keep them to their respective sides, and whose duty it is, besides, to see that fair play is carried on. After each captain has posted a trustworthy member of his side at the goal as 'keeper,' the players on each side are duly placed, and the game is begun by the ball being kicked towards one of the goals from a point midway between each. The side which kicks the ball *through* (by one set of rules) or *over* (by another) the goal, scores one point towards game, which is decided by the greatest number of goals in a given time. The whole space of time which a game occupies is divided into equal parts, after each of which the players usually change ends, so that no undue advantage be derived by one side from sloping ground, favouring wind, &c. The process of changing, moreover, affords a little breathing-time.

---

* The bone is not shewn in the figure.

The ball generally used is made of an ox-bladder covered with strong leather; india-rubber balls are considered inferior.

With popular games, such as cricket, &c., the rules laid down are for the most part binding all over the country; the same remark, however, does not apply to football, as each district seems to have rules of its own. Thus, those of Rugby, Winchester, Eton, &c., all differ materially, though the general methods of playing the game are the same.

The following, which we borrow from *Every Boy's Magazine*, No. 1 (London, Routledge), in which there is an excellent treatise on the game, are sufficient for general purposes. 1. The game being essentially *foot*-ball, no player may take up the ball from the ground. 2. If a player can catch the ball in the air, he may take a hand-kick without the other side being permitted to interfere. (A hand-kick consists in dropping the ball from the hands, and kicking it on its fall.) 3. If such player shall drop the ball accidentally, or in any way touch the ground with it, the opposite side may attack it. 4. If the ball pass outside or over the goal, and beyond the goal-line, the junior player of the side which drove it over shall fetch the ball, stand twelve paces to the right of the centre point (mid-way between the goals), and throw it gently to the centre without favour to either side. This rule is used because it sometimes happens that irritable players, finding the enemy's goal too well defended, wilfully kick the ball far beyond it, hoping to exhaust their opponents, and thus needlessly prolong the game. It is a mark of bad play, as well as unmanliness, to drive a ball where it can be of no use, and the penalty deprives the offending side of the junior player while he throws in the ball, and thus has the effect of deterring them from repeating the error. 5. Any kicking, except at the ball, is prohibited. 6. The ball must be *kicked* through the goal, not struck or thrown, or touch any part of any player of the same side, except the foot of him who kicks it; otherwise, the ball is fetched back, as in rule 4.

FOOTE, SAMUEL, actor and writer of comedy, was born of a good family at Truro, in Cornwall, 1720. He was educated at Worcester College, Oxford, and about 1740 entered the Temple; but after a career of 'pleasure' extending over four years, in the course of which he managed to dissipate a couple of fortunes which had been left him, he turned his attention to the stage as a means of support, and in 1744 made an unsuccessful début in the character of Othello. In 1747, he opened the Haymarket Theatre—where he was at once director, actor, and dramatic author—with a piece entitled *Diversions of the Morning*. In this and other pieces, he introduced well-known living characters, and, by his admirable powers of mimicry, succeeded in drawing large audiences, till the theatre was closed by order of the magistrates. After 1752, he continued to perform alternately in London and Dublin. In 1766, he broke his leg by a fall from his horse, and amputation was found necessary. He, however, recovered his health and spirits, and even turned the incident to account on the stage, composing parts expressly adapted to his own state. He died at Dover, 21st October 1777. A variety of comic anecdotes respecting F. are given in Cooke's *Memoirs of Samuel Foote* (London, 1805). His conversation must have been inimitably comical. Dr Johnson, who had a power of refusing to be pleased against his will greater than most men, met F. for the first time at Fitzherbert's, and assumed his
most ursine manner; but it was no use: '
obliged,' he says, 'to lay down my knife an
throw myself back in my chair, and fairly l
out. Sir, he was irresistible.' His dramatic
of which the best are *An Auction of Pictur*
Minor, *The Englishman Returned from Par*

poultices are advisable; but in the
earlier stages, the parts should be
a solution containing to the pint
ounce each of sulphuric acid and

When ulcers appear, they must be touched with lunar caustic, or dressed with the paste already recommended.

FORAGE (from Fr. *fourage*, a contraction of the barbarous Latin *fodderagium*, taken in its turn from the Gothic *fodur*, fodder), hay, straw, and oats supplied to horses of officers and soldiers in the army. Where troops are together, the provision of forage devolves on the commissariat: officers of the staff, &c., who are entitled to horses, but whose duties are at stations where bodies of horse are not collected, receive a money allowance, in lieu of forage in kind, varying according to the place and price of provender, but usually about 1s. 10*d*. to 2s. per horse per day. When a soldier is *en route* away from his regiment, the innkeeper with whom he stops is bound, under the Mutiny Act, to provide his horse with the specified ration of forage—viz., 10 lbs. oats, 12 lbs. hay, and 8 lbs. aw, for the payment of 1s. 9*d*. a day, which must also include stabling.

FORAMINIFERA, a group of marine animals of very low organisation, consisting of a gelatinous substance enclosed in a shell, which is generally calcareous, either simple or divided into chambers variously arranged, and pierced with pores or passages (*foramina*, whence the name), through which long delicate processes of the soft animal are otruded, but for what purpose is not very well own, whether to seize food, to imbibe nutritive , for locomotion, or for all these purposes. of the species are minute, although one of than two inches in diameter has been found in meo, and fossil forms approaching to this size well known under the name of Nummulites v.) from their resemblance to coins. The species are very numerous, and have been d into many genera. They are found sea-sand, and among all the dredgings of deep water. The fossil species are still more numerous, and constitute great part of some calcareous rocks, as of chalk. The F. are of very beautiful forms. Some of the simple ones are orbicular, some curiously flask-shaped; those in which the animal is divided into segments, and the shell consequently chambered, sometimes have the segments arranged in a straight line, sometimes spirally, sometimes alternately, &c. The great resemblance of some of the convoluted chambered shells of the F. to the shells of the genus *Nautilus*, led Linnæus and many naturalists to rank them with that genus, and the F. were reckoned among the most highly organised molluscs, a place from which comparatively recent discoveries have completely removed them. They are now regarded as more nearly related to Sponges and to such animals as the *Proteus* or *Amœba*. 'The *Foraminifera* are evidently composite fabrics evolved by a process of continuous gemmation, each gemma remaining in connection with the body by which it was put forth, and according to the plan on which this gemmation takes place will be the configuration of the shell.'—Rymer Jones. Reproduction takes place by the detachment of minute granules in great numbers, and is apparently accompanied with the death of the parent. See PROTOZOA.

Foraminifera:

1, Orbulina Universa; 2, Lagena Striata; 3, Textilaria; 4, Operculina; 5, Faujasina; 6, Rosalina Globularis; 7, Cassidulina; 8, Part of two chambers of an Orbiculina; 9, Vertical section of fossil Nummulite.

Fossil Foraminifera. The earliest records of this order yet observed are in sandstones near St Petersburg, belonging to the Lower Silurian measures. Scattered through these sandstones are numerous green grains, which have been shewn by Ehrenberg to contain, in their interior, silicious casts of shells similar to the recent genera *Guttulina* and *Textularia*. Forms, apparently referrible to the last genus and to *Fusulina*, constitute a large portion of some beds of carboniferous limestone in Russia, and also in the United States. Among the Secondary rocks, and especially in the Chalk, foraminifera are very abundant. Chalk, indeed, is composed almost entirely of the perfect or broken shells of *Rotalia*, *Spirulina*, *Textularia*, &c. (see CHALK). They are not more numerous in the Tertiary strata, but here they attain an enormous size—gigantic compared with any that preceded them, or with recent forms. Vast beds of limestone occur on the borders of the Mediterranean, composed almost entirely of these large forms. See NUMMULITES and NUMMULITE LIMESTONE.

FORBES, DUNCAN, of Culloden, a celebrated Scottish politician of the 18th c., and Lord President of the Court of Session, was born either at Culloden or at Bunchrew—for the family possessed both estates—in the neighbourhood of Inverness, on the 10th November 1685. In 1704, the year that his father died, F., then a lad of 19, commenced his legal studies in Edinburgh; but the following year he removed to Leyden, then the great school for Scottish lawyers of revolution principles, where he studied for two years with the greatest diligence. In addition to the knowledge of the civil law, which was no doubt the principal object of his residence at Leyden, we are told that he made considerable progress in Hebrew and several other Oriental languages. On his return from Leyden, F. was called to the bar, and almost immediately after appointed sheriff of Midlothian—a promotion the rapidity of which is somewhat inconsistent with modern usages. He rose rapidly into practice and into political influence through his connection with the Great Duke of Argyle, then in the zenith of his power, to whom he was united by family ties, and of whose estates he acted as a sort of manager. He married Mary Rose, the daughter of the Laird of Kilravock, a woman of beauty and accomplishment, to whom he is said to have been devotedly attached. She died shortly after their marriage, leaving him an only son, John, who eventually succeeded to his estate, but did not inherit his abilities. During both of the rebellions, Duncan F. acted a prominent part on the side of the Hanoverian government. In 1715, he was in the north, actively engaged in opposing the rebels, along with his elder brother John, who is said to have expended £3000 on the royal cause, not one shilling of which was ever repaid him. But on this, as on all other occasions, Duncan's partisanship was of the most moderate kind. After the suppression of the rebellion, he was opposed to the project of carrying the prisoners out of Scotland, to be tried by English juries, and he wrote to Lord Islay, when he heard that it was proposed to appoint him lord advocate, that he should certainly decline that office. He wrote to his brother, proposing a subscription for the comfort of the prisoners. 'It is certainly Christian,' he said, 'and by no means disloyal, to sustain them in their indigent state till they are found guilty.' To the forfeitures also he was opposed, on grounds of policy as well as of humanity. The only effect of his moderation was to bring suspicion on his own loyalty. But he was too important for his promotion to be arrested. In 1716, he was appointed depute to the lord advocate; in 1722, he was returned to sit in parliament for the Inverness district of burghs; and in 1725, he was lord advocate. He was not distinguished as a debater, but he was largely employed at this period of his career in appeal cases, and he enjoyed the friendship of Sir Robert Walpole, Lyttleton, Mansfield, and Hardwick. He seems even to have penetrated the literary circles in which Swift, Pope, and Arbuthnot were the ruling stars. In 1734, his brother John—Bumper John, as he was called—died, and he succeeded to the estates of the family. In earlier life, Duncan partook of the convivial habits for which his family was distinguished, in an age that was famous for deep potations. Mr Burton records various anecdotes illustrative of his powers in this direction, but he abandoned the practice when his health began to suffer, and devoted himself to more serious if not more onerous duties. During many subsequent years, he in no insignificant degree ruled the destinies, and contributed to the dawning prosperity of Scotland by fostering and developing her internal resources. His policy was to extinguish the rebellion by gaining over the Jacobites to the government. The purity and uprightness of F.'s character were subjected to a severe test. His whole correspondence during these troubled times came to light some seventy years after his death; and though few men ever wrote or were written to with less idea of publication, 'we have not been able,' says Mr Chambers (*Biographical Dictionary of Eminent Scotsmen*), 'to detect a single one of his advices or proceedings, by the exposure of which even a private gentleman of the most delicate honour, and the most reasonable views, would have cause to feel a moment's uneasiness.' Having freed himself from the shackles of party, his great object was to improve the trade and agriculture of the kingdom. But his views of political economy were not greatly in advance of his time; for in order to encourage the use of malt, he presented to the government a long and detailed scheme for preventing, or rather for punishing the use of tea. F. was appointed President of the Court of Session in 1737; but he still continued his interest in the general improvement of the country. Though he was aware of the character, and, in general, of the designs of the Jacobites, the rebellion of 1745 took the President by surprise. But he was no sooner aware of the danger than he hastened to the north, as he had done on the occasion of the former outbreak, and by his presence and the influence which he possessed in his own district, did much to counteract the proceedings of the rebels. Lovat, as is well known, betrayed both him and the government, and actually made an attack on Culloden House, from which he was beaten off with great spirit by the President and his people. When the rebellion spread, he was

forced to abandon his house, and take refu
island of Skye, where he remained till
battle of Culloden. On his return, in
reaping the fruits of his services, he was
with jealousy and aversion by the gov
Even the large sums of money which
advanced were never repaid him; and it is
the ingratitude of the government, com

miserable affair, weighed so heavily on h
as to shorten his life. He discharged hi
duties, however, with great zeal and a
within a month of his death, which took
December 10, 1747. There is a beautiful
the Lord President F., who was a man
elegance of person and manner, in the P
House in Edinburgh. The most recent
plete biography of Forbes is that of Mr
his Lives of Simon Lord Lovat and Dun
1848.

FORBES, Edward, an eminent natur
born at Douglas, Isle of Man, February
and died in Edinburgh, November 18,
received a desultory and imperfect edu
early life, in consequence of ill health;
he left home at the age of 16, he ha
possessed himself of a very considerable
knowledge in the departments of botany
and geology. In 1831, F. went to Lon
the intention of becoming a student at
Academy; but although he evinced much
in drawing, his artistic talents were not
marked to hold out any prospect of succe
event of his making art his profession; and
fore determined to turn his attention to
and, with this view, entered the university
burgh. In 1836, he finally relinquished h
medical studies, to devote himself exclu
the natural sciences. In 1836—1837, he
lectures at Paris, where he studied under
St Hilaire, Jussieu, and De Blainville, wh
the same time availed himself with dilige
the advantages afforded to students by the
and libraries of Paris. From the first yea
college life, F. had spent his summe
in rambles over various parts of Great
in excursions on the continent, and th
the observations which he made during
which were published by him either in
separate works, or in the pages of current
journals, sufficiently attest his dilige
observer, and his exact appreciation of
and differences of forms. F. may almost b
as the originator of the use of the dre
employed with equal success in inv
marine fauna of our own seas, and of
ranean and the Ægean. In 1841, he j
veying ship *Beacon*, as naturalist, and
that vessel during the survey of a part of
and co-operated in the exploration of
Xanthian cities. On his return to
he found that he had, during hi
elected to the chair of botany, Ki
London. He was soon afterwards
of the Geological Society; and from
his removal to Edinburgh, he rema
living in a vortex of scientific labo
work. In 1844, he was appointed
to the Museum of Geology in connect
Ordnance Geological Survey; and in
opening of the new buildings in J
London, he was named professor of
in the School of Mines. In 1852, h
president of the Geological Society, an
before conferred on so young a man;

on the death of Professor Jameson, he was elected to the vacant chair of Natural History in the university of Edinburgh. In the summer of 1854, he delivered a short course of lectures—the only one he was destined to give—for at the commencement of the winter session he was seized with a severe illness, which speedily proved fatal, and terminated his life in the 39th year of his age, in the very zenith of his fame, and in the full vigour of his intellectual powers. F. had been a voluminous writer and a diligent observer of nature from his earliest youth, and had collected an immense mass of materials, many of which were, however, left at his death in a disorganised condition. He did much to advance and systematise special departments of natural history, both by his own labours and by the stimulus which he imparted to his associates and pupils; and it would be difficult to instance any naturalist who has exercised a greater influence on the thought and line of inquiry pursued by those who have cultivated the same branches of knowledge. His classification of the British *Star-fishes* opened a new era in that branch of zoology; and his discovery that air-breathing molluscs lived at the period of the Purbeck beds, has been the means of rectifying many erroneous hypotheses, and throwing unexpected light on several hitherto obscure points of geology, while the inferences which he drew from the presence of those animals have been fully corroborated. His Report on the Ægean Sea, and his observations of the tertiaries of Cos, which have proved of great value to geology, raised him to the [illegible] rank among living naturalists. From an [illegible] period, he had directed his attention to the [illegible]ribution of animal and vegetable life in different [illegible] of the sea and land, and his observations [illegible] path of inquiry have opened many new [illegible] of research. F. was a diligent contributor [illegible] the current scientific literature of the day, [illegible] many of his best papers were written for [illegible] meetings of the British Association, of which [illegible] was an active member, and for the various [illegible] with which he was connected; while he took a most efficient share in the labours of [illegible] Ordnance Survey during his connection with [illegible]. His separate works, papers, and mono[illegible], of which upwards of 200 are published, many of which are copiously illustrated by [illegible] own beautiful drawings, cannot be individually [illegible]d; but among them we may instance the [illegible]ng: *On the Distrib. of Pulmonif. Mollusca* [illegible]*rope* (1838); *Malacol. Monensis* (1838); *Star* [illegible] (1841); *The Radiata and Mollusca of the* [illegible] (1843); *Travels in Lycia* (written in con[illegible] with Lieutenant Spratt, 1846); *Naked-*[illegible] *dusae* (1847); *British Mollusca* (1853, 4 [illegible] 8vo, conjointly with S. Hanley); the Map [illegible] *Homoiozoic Belts* (Johnston's *Phys. Atlas*, 1854); [illegible]*ection of Literary Papers by E. Forbes* (1855); See *Memoir* by G. Wilson and A. Geikie, 1861.

FORBES, SIR WILLIAM, of Pitsligo, Bart., an eminent Scottish banker, son of Sir William Forbes, Bart., advocate, was born in Edinburgh, April 5, 1739. He succeeded his father when only four years old, and received his education at Aberdeen. In his 15th year, he was introduced into the bank at Edinburgh of Messrs John Coutts & Co.; and in 1761, was admitted a partner. In 1763, one of the brothers Coutts having died, while another retired on account of ill health, and two others were settled as bankers in London, a new company was formed, consisting of Sir William Forbes; Mr Hunter, afterwards Sir James Hunter Blair; Mr, afterwards Sir Robert Herries; and Messrs Stephen and Cochrane. They at first carried on business in the name of the old firm. On 1st January 1773, however, on some changes in the partnership taking place, the name was changed to that of Sir W. Forbes, J. Hunter, & Co., and of this firm Sir William continued to be the head till his death. In 1781, he purchased the estate of Pitsligo, Aberdeenshire, which had been forfeited by Lord Forbes of Pitsligo for taking part in the rebellion of 1745. Animated by genuine patriotism and public spirit, he introduced the most extensive improvements on it, and laid out and built the village of New Pitsligo. He was a member, with Johnson, Burke, Garrick, Reynolds, and others, of the celebrated Literary Club of London, and the author of a Life of his friend, Dr Beattie, the poet, published, with his works, in 2 vols. 4to, in 1805; also of *Memoirs of a Banking House*, being the history of his own, edited by Mr Robert Chambers (Edinburgh, 1860). He died at his seat near Edinburgh, November 12, 1806, aged 68. By his wife, Elizabeth, eldest daughter of Sir James Hay of Hayston, Bart., he had three sons and five daughters. Universally esteemed and respected, his character is well described by Sir Walter Scott in the introductory address of one of the cantos of *Marmion*. His bank became, in 1830, the Union Bank of Scotland.

FORBES, JAMES DAVID, Principal of the United College in the university of St Andrews, a grandson of Sir W. Forbes, the banker, was born at Colinton, near Edinburgh, April 20, 1809. He studied in the university of Edinburgh from 1825 until 1830, when he was admitted to the Scottish bar. On the death of Sir John Leslie (q. v.), he was appointed, in 1833, to the chair of natural philosophy in the university of Edinburgh, after a contest in which, among other competitors, he was opposed by Dr (afterwards Sir David) Brewster and Mr Galloway. In 1842, the Institute of France enrolled him among its corresponding members. He was, besides, a member of numerous other scientific societies at home and abroad, received the Royal and the Rumford medals from the Royal Society of London, and two Keith medals from the Royal Society of Edinburgh, and was D.C.L. of Oxford. In 1860, F. resigned his chair in Edinburgh, to become Principal of the United College in the university of St Andrews. Among his contributions to science are—the polarisation of radiant heat by the tourmaline, and also by reflection (1836), and its circular polarisation—discoveries forming some of the strongest proofs of the identity of calorific and luminous rays; the unequal polarisation of heat from different sources (1844); the refrangibility of heat; the depolarisation of heat; &c. This whole series of experimental results is of a very high order of importance. He is, however, best known to the world in general by his researches on the motion of glaciers. See *Travels in the Alps* (1843); *Norway and its Glaciers* (1853); *Tour of Mont Blanc and Monte Rosa* (1855); and *Occasional Papers on the Theory of Glaciers* (1859). He was undoubtedly the first to establish the great *fact*, that glacier ice moves in its channel like a viscous fluid, the middle moving faster than the sides, and the upper portions faster than the lower. His *theory* of glacier phenomena has encountered a good deal of opposition from some quarters, and cannot yet be considered as entirely settled. See GLACIERS. In meteorology, F., among other things, improved Wollaston's application of the thermometer to the determination of heights, and verified with great care Fourier's theoretical results concerning the temperature of the ground at different depths and in different kinds of soil and rock. Besides the works already named, numerous very valuable papers by F. are to be found in the *Transactions of the Royal Societies of London and*

Edinburgh, in the *Edinburgh Philosophical Journal*, and other periodicals. He died Dec. 31, 1868.

FORBES, SIR JOHN, an eminent physician, was born October 18, 1787, at Cuttlebrae, Banffshire, and died November 13, 1861. After studying at Aberdeen and Edinburgh, he entered the navy in 1807 as assistant-surgeon, and continued on active duty till 1816, when he finally left the service. In 1817, he took the degree of M.D. at Edinburgh, and soon afterwards settled as a physician at Penzance, from whence he removed in the course of a few years to Chichester. In 1840, F. went to London, where he speedily obtained a large practice. He was knighted in 1853 by the Queen, to whose household he held the appointment of Physician in Ordinary, while he was at the same time Physician Extraordinary to Prince Albert. He was a Fellow of the College of Physicians, and the Royal Society of London; D.C.L. of Oxford, and a member of numerous foreign societies. F., conjointly with Drs Tweedie and Conolly, was the editor of the *Cyclopædia of Practical Medicine*, which, in addition to the numerous contributions of the editors, included the labours of more than sixty British physicians, of the first rank. This work, which has exercised a most beneficial influence both on the theory and practice of medicine, was completed in 4 vols. 8vo, in 1835. In 1836, F. founded the *British and Foreign Medical Review*, which he carried on with great success for twelve years. The services which he thus rendered to his brother-practitioners placed him deservedly among the foremost of his profession. To F. in a great measure belongs the merit of having introduced the use of the stethoscope in England, and of having successfully directed the attention of British practitioners to the art and practice of physical diagnosis. In 1831, he published the first edition of his translation of Laënnec's *Treatise on Auscultation*; and in 1838, when the fifth edition appeared, the new method was already extensively used. F. was a ready and pleasant writer, as is amply shewn by the various records of his summer rambles; among which we may instance his *Physician's Holiday* (1849), and his *Sight-seeing in Germany and the Tyrol* (1856). His last professional work, entitled *Nature and Art in the Cure of Diseases* (1857), contains a systematic exposition of his medical opinions and doctrines.

FORBES MACKENZIE ACT. The statute, popularly known by the name of the gentleman (Mr Forbes Mackenzie, M.P. for Peeblesshire) who introduced the bill, is the 16 and 17 Vict. c. 67, entitled 'An Act for the better Regulation of Public Houses in Scotland.' This act retained in general the provisions of 9 Geo. IV. c. 58, by which the granting of certificates by justices of the peace and magistrates, authorising persons to keep common inns, ale-houses, and victualling-houses in Scotland was regulated. But it prohibited the granting of certificates for excisable liquors to be 'drunk on the premises,' unless on the express condition that no groceries or other provisions to be consumed elsewhere should be sold in the house or premises with respect to which such certificate is granted. The object of this portion of the enactment being to prevent grocers from becoming in reality the keepers of tippling-houses, those persons continued to be permitted to sell liquors by retail, provided that they were not consumed in their shops. In accordance with the principle of distinguishing between the different classes of houses in which the trade of a spirit-dealer should be carried on, three different grades of licences were introduced: those applicable, viz.,
1, to inn or hotel keepers; 2, to public-hous
and 3, to grocers and provision-dealers.
the first class, it is enacted that they
'keep open house, or permit or suffer an
in any part of the premises belonging t
sell or give out therefrom any liquors
o'clock in the morning, or after ele
night of any day, with the excep
ments to travellers, or persons req
the said house or premises; and further,
shall not open their houses for the
liquors, or sell or give out the same
except for the accommodation of lodgers
fide travellers.' The same restrictions a
on the second class of persons—viz., the
public-houses, with this addition, that no
is made in their case in favour of tr
lodgers; whilst grocers and provision-
addition to the prohibition to open on Su
that already mentioned with reference t
sumption of spirits on the premises, are
'to sell or give out any liquors before
in the morning, or after eleven o'clock
Separate licences were also introduced
of malt liquors from those applicable t
wine and spirits, all of which had
included under one licence. By
for the first time in Scotland, th

these circumstances, it becomes important to know that it has been decided in England that to constitute a 'traveller' within the meaning of the corresponding Act 18 and 19 Vict. c. 118, s. 2, it is a matter of indifference whether the parties be travelling for business or pleasure, and that a walk, ride, or drive, for exercise and amusement of such length as to render refreshments desirable, is a sufficient journey. In Atkinson v. Sellers (5 C. B. N. S. 442), Chief Justice Cockburn remarked, that 'a man could not be said to be a traveller who goes to a place merely for the purpose of taking refreshment. But if he goes to an inn for refreshment in the course of a journey, whether of business or of pleasure, he is entitled to demand refreshment, and the innkeeper is justified in supplying it.' See also Taylor v. Humphreys, C. P. 705; 4 L. T. N. S. 314. The first was in the case of a drive from Liverpool of 5¼ miles, the second of a walk from Birmingham of 4 miles.

FORBIDDEN FRUIT, a name fancifully given to the fruit of different species of *Citrus*. In the shops of Britain, it is a small variety of the Shaddock (q. v.) which generally receives this name. But on the continent of Europe, a different fruit, regarded by some as a variety of the orange, and by some as a distinct species (*Citrus Paradisi*), is known as the Forbidden Fruit, or Adam's Apple. Like some other fruits of the same genus, it was recently introduced into the south of Europe from China. The tree has broad, tapering, and pointed leaves, the leaf-stalks winged; the fruit is large, somewhat pear-shaped, greenish yellow, of very uneven ace, having around its base a circle of deeper ssions, not unlike the marks of teeth, to which obably owes its name. It is chiefly the rind h is the edible part; the rind is very thick, er, melting, and pleasant; there is very little the pulp is acid.

name Forbidden Fruit has also been given to uit of *Tabernæmontana dichotoma*, a tree of n, of the natural order *Apocynaceæ*. The of the fruit—which is a follicle, containing —suggests the idea of a piece having been off, and the legend runs that it was good Eve ate of it, although it has been poisonous since.

ORCE; ENERGY. Till we know what Matter r.) is, *if there be* matter, in the ordinary sense of word, at all, we cannot hope to have any idea absolute nature of force. Any speculations subject could only lead us into a train ypotheses entirely metaphysical, since utterly nd the present powers of experimental science. re content ourselves with a definition of force d on experience, such a definition will say ng of its nature, but will confine itself to the s which are said to be due to force, and in present state of our knowledge it is almost sterous to aim at more.

r first ideas of force are evidently derived from exertion required to roll, or lift, bend, or com s, &c., some mass of matter; and it is easy to that in all such cases where muscular contraction oyed, matter is moved, or tends to move. e, then, we may say generally, is *one cause which duces, or tends to produce, a change in a body's state st or motion*. See Motion, Laws of. The unt or magnitude of a force may be measured in of two ways: 1. By the pressure it can produce, the weight it can support; 2. By the amount of n it can produce in a given time. These are d respectively the Statical and Dynamical sures of force. The latter is, as it stands, somes ambiguous. What shall we take as the quantity of motion produced? Does it depend merely on the velocity produced? or does it take account of the amount of matter to which that velocity is given? Again, is it proportional to the velocity itself, or to its square? This last question was very fiercely discussed between Leibnitz, Huyghens, Euler, Maclaurin, the Bernouillis, &c.; Leibnitz being, as usual with him in physical questions, on the wrong side. Newton, to whom we owe the third law of motion, had long before given the true measure of a force in terms of the motion produced. This law is an experimental result—that when pressure produces motion, the *momentum* produced (see Momentum) is proportional to the pressure, and can be made (numerically) equal to it by employing proper units. Hence momentum is the true dynamical measure of force, which, therefore, is proportional to the *first* power only of the velocity produced. What is properly measured in terms of the *square* of the velocity, we shall presently see. For various properties of force, statical and dynamical, see the following articles: Composition of Forces, Couples, Centre of Gravity, Central Forces, Falling Bodies, Mechanical Powers, Virtual Velocities.

It is obvious that in order to produce any effect at all, or to do **work**, as it is technically called, a force must produce *motion*, i.e., must move its point of application. A weight laid on a table produces no effect whatever unless the table yields to the pressure, i.e., unless the weight descends, be it ever so little. We do no work, however much we may fatigue ourselves, if we try to lift a ton from the floor; if it be a hundredweight only, we may lift it a few feet, and then we shall have done work—and it is evident that the latter may be measured as so many pounds raised so many feet—introducing a new unit, the Foot-pound, which is of great importance, as we shall shortly see, in modern physics. See Work. This is evidently, however, a statical measure of work, since no account is taken of velocity. Have we then for work, as we had for force, a *dynamical* measure? Let us take a simple case, where the mathematical investigation is comparatively very easy, and we shall find we have. We know (see Velocity; Motion, Laws of) that if a particle be moving along a line (straight or not), and the distance moved (in the time t) along the line from the point where its motion commenced be called s, its velocity is $v = \frac{ds}{dt}$. Also we know that the force acting on it (in the direction of its motion) is to be measured by the increase of momentum in a given time—this gives (just as the last equation was obtained) $F = m\frac{dv}{dt}$. From these two equations, we have, immediately, $mv\,dv = F\,ds$, or, as the rudiments of the differential calculus give at once, $\frac{mv^2}{2} = \int F\,ds = Fs$ if the force be uniform.

The quantity on the right-hand side is the sum of the products of each value of F, by the corresponding space ds, through which the particle moved under its action. It is therefore the whole work done by the force. On the left hand, we find half the product of the mass, and the square of the velocity it has acquired; in other words, the Vis-viva (q. v.). Hence, in this case, the vis-viva acquired *equals* the amount of work expended by the force.

It appears from a general demonstration (founded on the experimental laws of motion, and therefore true, if they are), but which is not suited to the present work, that if, in any system of bodies, each be made up of particles or atoms, and if the forces these mutually exert be in the line joining each two, and depend merely on the distance between them, then we can express the required proposition in the following form:

Any change of vis-viva in the system corresponds to an equal amount of work gained or lost by the attractions of the particles on each other.

What is spent, then, in work, is stored up in vis-viva; and conversely, the system, by losing some of its vis-viva, will recover so much work-producing power. If we call the former, as is now generally done, *Actual*, and the latter *Potential*, *Energy*, we may express the above by saying, that in any system of bodies where the before-mentioned restrictions are complied with, *the sum of the actual and potential energies cannot be altered by the mutual action of the bodies.* The most simple and evident illustrations of this proposition are to be found in the case of the force known as gravitation. The potential energy of a mass on the earth's surface is zero, because, not being able to descend, it has, in common language, no work-producing power. If it be raised above the surface, and then dropped, it is easy to see that the work expended in raising it will be exactly recovered as vis-viva after its fall. For (see FALLING BODIES) a mass falling through a space, h, to the earth acquires a velocity v, such that $v^2 = 2gh$, or if m be the mass, $\frac{mv^2}{2} = mg.h$. The left-hand side gives the vis-viva acquired by the fall—the right is the product of the weight (mg) and the height fallen through—or is the work required to elevate the mass to its original altitude.

Hence we may calculate the amount of work which can be obtained from a *head* of water in driving water-wheels, &c., remembering, however, that there is always a *loss* (as it is usually called) due to friction, &c., in the machinery. That there is a loss in useful power, is true, but we shall find presently that in energy there is none, as indeed our general result has already shewn. *Where* the apparently lost energy goes, is another question.

Another good example of potential energy is that of the weights in an ordinary clock. It is the gradual conversion of potential into actual energy in the driving weight which maintains the motion of the clock, in spite of friction, resistance of the air, &c.; and we have in the actual energy of sound (which is *motion*) a considerable portion of the expended potential energy of the striking weight. A coiled watch-spring, a drawn bow, the charged receiver of an air-gun, are good examples of stores of potential energy, which can be directly used for mechanical purposes.

The chemical arrangement of the different components of gunpowder, or gun-cotton, is such as corresponds to enormous potential energy, which a single spark converts into the equivalent active amount. But here, *heat* has a considerable share in the effects produced; it may then be as well, before proceeding further, to consider how we can take account of it, and other physical forces, as forms of energy.

Correlation of Physical Forces.—So far as we yet know, the physical forces may be thus classified: I. GRAVITATION (q. v.); II. MOLECULAR FORCES—COHESION (including CAPILLARITY), ELASTICITY, CHEMICAL AFFINITY; III. HEAT AND LIGHT; IV. ELECTRICITY (including MAGNETISM); V. ANIMAL FORCE; VI. VITAL FORCE, having, as some most irrationally suppose, an analogue in inorganic masses, which may be called Crystalline Force. (This idea is examined further on.) Of these, I., II., and some forms of III., are more immediately connected with *matter* than the others—that is to say, that the remainder almost necessitate the hypothesis of the existence of some medium unlike ordinary matter, or,
in popular language, an *imponderable.*
universal opinion of physicists, however,
be, that even the former must be accoun
some such way. Newton, in his second

the probability of the truth of this hyp
shall consider this again.

Class V. may be deferred for the present.

As to Class VI., it seems, from the observations of physiologists as to the formation of cellular matter, and the production in living organisms of compounds which have not yet been made by ordinary chemical processes, that the vital force, if there be such, is not a force which does work, in the mechanical sense of the term, but merely *directs*, as it were, the other natural forces *how to apply* their energies. Were a railway train running on a smooth horizontal line of rails, it would retain for ever its original velocity; but in turning a curve, it would be acted on by deflecting forces, without which its path would be straight. These forces *do no work*, as is evident, since this would be shown in alteration of vis-viva, and none takes place. They modify, however, the direction in which the train moves.

When gangs of labourers and masons are at work building an edifice, the former are employed raising stones, mortar, &c., the latter in laying them; but there is present an overseer with a plan, who, doing (mechanical) work himself, guides and directs proper expenditure of force by the working . In this view of the case, the labourers are physical forces, and the overseer the vital force. is quite certain that the so-called crystalline orce cannot properly be put in this category, as presenting even an analogy, however slight; it is probably an effect, not a cause, and due to the ent forms of simple or compound particles of er, and the consequent variations in their ecular forces in different directions.

So far, then, for the possible nature of the forces, with the probable exception of VI., can be ed as various forms of energy. Can they be ed one into another, as the different kinds anical energy can? Take the potential of gravitation to begin with. We can employ drive a water wheel. This turns a shaft, to ch, if a tight break be applied, heat will be duced by friction, and light also, if a rough el on the shaft be made to rotate against a of flint or pyrites; or electricity may be duced by employing the moving power to turn ordinary electrical machine, or a magneto-tric one; and from the electricity so produced, trical attractions and currents may be derived; them heat and light again. Or the currents e employed to magnetise a needle or a piece iron, or to produce chemical decomposition.

n, heat may be employed by means of a ngine as a substitute for the water-power or al energy of gravitation, and the above effects duced. It may also be employed in raising , and therefore in producing the potential in question; or it may be employed to pro- hermo-electric Currents, and thence all the effects of electricity, including the motion gnetic needle.

may be employed to produce chemical ation or decomposition, as we see in photo- ; it may also by the same means be made to electric currents, and consequent *motion* of e. It is not yet proved that light can pro- magnetism *directly*, though there can be little that, if properly applied, it is capable of n.

mical action in a voltaic battery can be made duce motion, heat, light, electricity, electrical tions and magnetism, and to overcome other ical affinity.

pillary action has been employed to produce ricity, and mechanical effects, &c., but we need through the whole category.

hese experimental results, then, consists what called the Correlation of the Physical Forces—i.e., the transmutability of one of the latter into another or others. The idea is old, but the proofs of its truth have only become numerous within the last half-century. Grove has published an excellent treatise with the above title; to this we refer the curious reader for further detail on this interesting subject.

Conservation of Energy.—But a far more important principle, being, in fact, the *precise* statement of the preceding—which is somewhat vague—is that of the Conservation of Force, or rather Energy. It is simply the extension (to all the physical forces) of the principle which we have given in full, and proved in a particular case, at the beginning of this article—i.e., that the sum of the potential and actual energies of any set of moving bodies cannot be altered by their mutual action. Let us now suppose heat, light, &c., to consist in vibratory movements of particles, and in their relative states of distortion, &c., and make the supposition that these particles act on each other—no matter by what means—in the line joining each two, and with forces which depend on their distance, and we have at once the theorem, that the sum of the potential and actual energies is a quantity unalterable in any system, save by external influences. Hence, when mechanical power is said to be lost, as it is by the unavoidable friction in machinery, &c., it is really only changed to a new form of energy—in general, heat. Thus, when a savage lights his fire, he expends animal force in rubbing two pieces of dry wood together. If these pieces of wood were not in contact, no force would be required to move them past each other—more and more is required as they are more strongly pressed together. The equivalent of this force so expended is found in the heat produced. Davy shewed that two pieces of ice might be melted by rubbing them together. A skilful smith can heat a mass of iron to redness by mere hammering. Here the actual energy employed is partly given out in the shape of heat, and partly stored up in the iron as potential energy due to the compression of the mass, or the forcible approximation of its particles. Amongst the earliest, and certainly the *best* experiments on this subject, are those of Joule (q.v.). He determined the relation between the units of heat and potential energy of gravitation, by various methods, which gave very nearly coincident results. One of these we may mention. A paddle-wheel is so fixed as to revolve in a closed vessel full of water. The wheel is driven by the descent of a known weight through a measured space, and precautions are taken against losses of energy of all kinds. The water agitated by the paddle-wheel comes soon to rest, as we know; but this is due to friction between its particles; and the final result is the heating of the water. The quantity of water, and also the number of degrees by which its temperature is raised, being measured, a simple proportion enables us to find how many foot-pounds (see FOOT-POUND) of mechanical energy correspond to the raising by one degree the temperature of a pound of water. The result is, that the heating a pound of water one degree Fahrenheit is effected by 772 foot-pounds—and this number is called Joule's Equivalent. In other words, if a pound of water fall to the ground through 772 feet, and be then suddenly arrested, its temperature will be raised one degree; and, conversely, the heat that would raise the temperature of a pound of water one degree, would, if applied by a steam-engine or otherwise, raise 772 pounds one foot high. Now (see the article HEAT), we know the amount of heat which is produced by the burning (in air) of any material whose composition is known.

It follows, then, that from the mere quantity and composition of a substance, we can tell the amount of mechanical work due to its combustion; that is, supposing it all to be effective. As we have been led to the mention of heat of combustion, let us consider what this is due to. Combustion (in air) is merely a chemical combination of the constituents of the burning body with oxygen—the heat and light which are developed are therefore, by the conservation of energy, equivalent to the excess of potential energy of the uncombined, over the combined, oxygen and combustible.

That this is the real state of the case—and that the original setting fire to the combustible has nothing to do with the matter, as is frequently imagined—will be made evident by considering any spontaneous combination, say that of chlorine and copper filings, or of mercury and sodium, &c., in which cases the potential energy lost by the compound appears as heat, light, and sometimes sound.

The equivalents of the other physical forces have not been even approximated to, with the exception of that of light. Thomson has determined the energy of a cubic mile of sunlight at the earth to be somewhere about 12,000 *foot-pounds*, giving about 10,000 as the *Horse-power* (q. v.) of each square foot of the sun's surface. There are some additional difficulties in the way when we seek the equivalent of electricity, for here the question arises: 'Is there a special substance which is, or whose motions are, electricity, or is it merely another mode of motion of the luminiferous ether?' for we can scarcely suppose it to be due to motions of the particles of *matter*. If the first, we have as yet no means of estimating its energy; if the latter, we may consider it as within the reach of experiment. It may merely be remarked here, that Weber's exquisite theoretical statement of dynamical electricity—resting on the fundamental assumption that there are two *electric fluids*—requires the admission of mutual forces, which vary with the relative velocity of its particles, and for which, therefore, the conservation of energy does *not* hold.

Helmholtz, in an admirable paper (*Ueber die Erhaltung der Kraft*, translated in Taylor's *Scientific Memoirs*, New Series, i.), starting from the assumptions above explained, has applied the principle of conservation of force to the investigation of many recondite problems connected with most of the physical forces. We cannot, of course, enter into his work in detail, as it is somewhat analytical, but we may freely borrow such of its contents as we have not already alluded to, at least such as will suit the plan of this article.

A very good example of the conservation of energy is found in the increasing velocity of a planet or comet as it approaches the sun, and thus loses potential energy; and also in the fact, that in the case of these bodies the mere distance from the sun, and the velocity at that distance, enable us to tell at once the nature of the orbit described—i. e., which of the conic sections it is.

Latent heat is a form of potential energy, depending on the physical state of the substance in which it is stored up. The same may be said of those substances which, when mixed, produce heat or cold, as water and sulphuric acid, or nitrate of ammonia. It is easily seen that here the heat or cold depends upon a change of molecular arrangement of some kind; that is, a change of the potential energy.

In magnetism and statical electricity, of course, the conservation of energy holds, as we know that all the phenomena can be explained by attractions and repulsions, following the law of gravitation. In the discharge of a Leyden battery, the potential energy lost is reproduced as heat in the connecting
wires, and as light, heat, and sound w
tive spark. In charging a Leyden ja
the electrophorus, the charge is directly
by the expenditure of mechanical force
coming the attraction of the negative ele
the resinous plate for the positive electric
cover.

In the ordinary voltaic battery, the exc
of potential energy in the cells, by the

Animal force, again—or
—is simply a transformation.

d. This is well illustrated by the increased
hich is required when man or beast abruptly
from a state of inactivity to one of toil, as
polar bear after his winter's sleep; or by the
r amount and better quality of food which
cessary for criminals subject to hard labour,
or those who are merely imprisoned.

e, then, as far as we have yet seen, there is
h thing as gain or loss of energy anywhere,
it appears that the ultimate transformation of
energy is heat, and that the latter tends to
form diffusion or dissipation, in which it is
ilable, as far as we know, for further trans-
tion (see HEAT), whence do we procure the
s of energy which are requisite to maintain
onomy of life? We answer: Chiefly, or indeed
, from the sun, whence they come as light and
heat, perhaps in other forms. Without the
ere would be vegetation? without the latter,
animal life? Where would be our stores of
rh er wood or coal? It is entirely, then,
, to the directly supplied energy of the
e look for the maintenance of life; and this
a question not of much importance to our-
. to be sure, but of vast future consequence to
n race: Is this supply finite? Will the
have given off all its energy, or is it
receiving accessions itself, and if so, has
haustible store to draw from?

solute consequence of the truth of the
n of energy is the impossibility of what
understood by Perpetual Motion (q. v.);
be carefully remembered that perpetual
the literal sense of the words, is not
e, but very general. If there were no
as friction, or if we had a perfectly
dy, in the form of a teetotum, for example,
spin for ever in vacuo with undiminished
The earth in its axial rotation affords a
example. Were it a perfect sphere, and of
m material, the other masses of the system
roduce no effect whatever on its rotation,
latter would, as indeed it does, as far as
n determine, remain for ever unchanged. And
as we have already seen, when one motion, as
city, or ordinary vis-viva, is lost, we find it
aring in other forms of motion, such as heat and light. But this is not the technical acceptation of the term, perpetual motion; it is popularly understood to mean a source of motion which will not only preserve its own vis-viva unchanged, but also *do work*. This is, of course, incompatible with the conservation of energy, for wherever work is done, equivalent energy in some form or other is consumed. As we have not, however, an absolute *certainty* of, though very powerful evidence indeed for, the truth of the principle, it would be unphilosophical to conclude that perpetual motion is absolutely impossible. It is certain, however, that it cannot be attained by any mechanical arrangement; and neither heat, light, nor magnetism can give us any assistance. If we knew more than we do at present about electricity, we should probably add it also to the category. The ordinary attempts which are still being made in thousands by visionaries, are simply absurd, based as they are for the most part on ignorant applications of mechanics. There is absolute impossibility here; and a 'perpetual motionist' of the common herd is far more infatuated than a 'squarer of the circle;' for the latter's problem *may* be solved, though certainly not by the means usually employed, or in the form usually sought for.

We may now briefly consider the theories of the physical forces which have been advanced of late times, and we may take such as are worth notice together. All of them assume at the outset forces of attraction or repulsion between particles, or else a highly elastic fluid, or rather solid, if we may so call it, in which the particles of matter float, or are imbedded. We have already considered the difficulties attending the latter supposition; but it is the only one which does not refer force back to force, thus apparently leaving the question where it found it. We may dismiss it with the remark, that a fluid or quasi-solid absolutely continuous and alike in every part is difficult to conceive; and it is hard to understand how motion can be propagated through it. If it be not continuous, forces must be supposed to be exerted by its parts on each other, else the motion of one part would not affect the others. There is one way in which the latter difficulty has been attacked, which seems plausible enough; and that is, that the particles of this fluid are in a state of rapid motion, and continually impinging on each other and on the particles of matter, no forces being exerted except those of pressure at the impact. But, unless these particles be supposed *elastic*, and what is elasticity but a form of molecular force (*force again*), their motion would be lessened at every impact, and destroyed completely if the impact were direct. This objection seems to be a very strong one. The first-mentioned theory, that of Æpinus and Mosotti, assumes that material particles float in a general atmosphere of ether, that the particles of each repel one another, but that a particle of matter attracts one of ether. From these suppositions, and an hypothetical law connecting pressure with density in such an ether, Mosotti has deduced gravitation and the molecular forces; but to apply the hypothesis to the other physical forces, other suppositions are necessary. These have been supplied by Clausius and Redtenbacher, who, with the assumptions of particles of matter and of ether as before, imagine those of matter to attract each other, and also those of ether, but the latter to be mutually repulsive. Light and radiant heat, according to this theory, are vibrations of the ether which fills all space between the particles of matter, or rather, between the atmospheres of ether which, by the foregoing assumptions, the particles of matter will collect about them. Heat consists of vibrations of the molecules of matter, or of the groups of atoms (see ATOMIC THEORY) of which the molecule of a compound body is built up, together with their atmospheres. Electricity, magnetism, &c., are explained to be rotations in the atmospheres. Redtenbacher and Clausius are not quite agreed as to the physical forces corresponding to each of these forms of motion, but the above sketch will give a general idea of the nature of their speculations.

But the most startling of all the reflections on force, and its ultimate nature, which have perhaps ever been made, are those of Faraday. Without calling in question in ordinary cases the truth of the conservation of energy, he has endeavoured, by experiment (the only genuine test in a question so novel and so profound), to prove what may be called the Conservation of Force, if we understand *force itself* and *not energy*. He argues thus: two masses, according to the undisputed law of gravitation, attract with four times their mutual force if their distance be diminished to half; and with only one-fourth of the same, if their distance be doubled. He asks *whence* comes the additional force in the former, and *what becomes of* the lost force in the latter case?

Now, it is evident that this is a new question, totally distinct from any we have yet considered. To answer it, we must know *what* force is. Would gravitation have any existence if there were but one particle of matter in the universe, or does it suddenly come into existence when a second particle appears? Is it an attribute of matter, or is it due to something between the particles of matter? Faraday has tried several experiments of an exceedingly delicate kind, in order to get at some answer to his question. A slight sketch of one of them must suffice. A pound-weight is not so heavy at the ceiling of a room as it is when on the floor; for, in the former case, it is more distant from the mass of the earth than in the latter. The difference for a height of 30 feet is (roughly) about $\frac{1}{350,000}$th of a pound. Now, if a mass of metal be dropped through such a space, an additional force, $\frac{1}{350,000}$th of its weight, is called into play, and the object of the experiment was to detect whether electrical effects accompanied this apparent *creation* of force. The mass, therefore, was a long copper wire, whose coils were insulated (see ELECTRICITY) from each other, and whose extremities were connected with those of the coil of a delicate Galvanometer (q. v.). Had any trace of an electric current been produced, the needle of the galvanometer would have been deflected, but, when all disturbing causes were avoided, no such deflection was detected. Other experiments with a view to the detection of other physical forces, were also tried, but, like the first, with negative results only. We must not, however, conclude that such can never be found, as this would be assuming the absolute truth, in all cases, of the conservation of energy, which is no doubt thoroughly borne out by experiment in many cases, but not even approximately in others; while even in the former class more delicate instrumental means *may* enable us to trace small but most important deviations from absolute exactness; and it is to the results of such trials that we must look for further information as to the *nature* of force, and the generality of the law of conservation of energy.

There are, in mechanics, several other quantities which retain a fixed value under certain circumstances. We may briefly consider a few of them.

Conservation of Areas. Invariable Plane.—We have seen (CENTRAL FORCES) that if a particle move about a centre of force, its motion is confined to a plane, and its radius vector traces out equal areas in equal times. Similar theorems hold in any system of particles acted on only by their mutual attractions. If in such a system we
the positions of the respective particles
tinually projected (orthogonally, see I
any fixed plane, and radii vectores to
any point in that plane to the projections
of the areas swept out by all those radii vecto
equal in equal times. Also, this being t
planes, there is one for which this sum i
mum, and *this plane is d in space.* It
called the invariable of
propositions hold for a
size, their several axial
account; hence what is called the I
(q. v.) of the Solar System.

Conservation of Momentum.—When tw
attract or impinge, the forces they exert
other are evidently equal and opposite.
measure of a force is the momentum it
hence equal and opposite momenta, in
their original quantities, will be commu
the masses, and therefore the sum of the
of the two, resolved in any direction,
unaltered; hence, *the sum of the mome*
number of bodies will be unaltered by
either of the nature of attraction or i act.

Conservation of the Motion of C
—Again, in such a system,
centre of gravity of the
direction is the sum of the momenta of
bodies in that direction; hence, *the cen*
of a system, subject to none but the
of its components, either remains at rest,
uniformly in a straight line.

under the provisions of the ex

consequently be repaid, and reparation in as far as possible must be made by the payment of damages for such personal injuries as the party who was dragged into it may have suffered from the enforcement of its provisions. See REDUCTION. By the law of England, Duress (q. v.) which will invalidate a contract must amount to fear of the loss of life or limb (Mayhem, q. v.). 'Whatever is done by a man to save either life or member,' says Blackstone, 'is looked upon as done upon the highest necessity and compulsion. Therefore, if a man, through fear of death or mayhem, is prevailed upon to execute a deed, or do any other legal act, these, though accompanied with all other the requisite solemnities, may be afterwards avoided.' But 'a fear of battery or being beaten, though never so well grounded, is no duress; neither is the fear of having one's house burned, or one's goods taken away and destroyed, because in these cases, should the threat be performed, a man may have satisfac- n by recovering equivalent damages.'—Stephen's n. i. p. 142. The avoidance of such a contract is, however, dependent on the will of the injured party. 'A contract made under duress may be avoided by the person whose free-will was thus trained, though he has also an election, if he ks proper, to insist upon it as a binding trans- action' (*Ib.* vol. ii. p. 62). But the parties who are entitled to treat a contract either as a nullity or a subsisting contract, must make their election, and nt, after treating the contract as rescinded, set as a subsisting contract (Addison on *Contracts*, pp. 73, 436, and 1074).

FORCELLINI, EGIDIO, an Italian philologist of at attainments, was born on the 26th of August in a village near Padua. Owing to the limited ns of his family, F. was deprived of the benefit arly instruction, and was already verging towards ahood when enabled to commence a regular of study in the seminary at Padua. His industry, combined with unusual powers of singled him out from his companions, the admiration of the learned principal, omo Facciolati, who even associated him with of his own scientific labours. The pupil ered his teacher valuable service in the com- sion of a highly important lexicon, a work h probably inspired both with the project on h F.'s literary repute is based, viz., the com- on of a vast and comprehensive vocabulary of Latin language. The work was published after death, and pronounced by public voice as one the most valuable acquisitions to philological nce of the age. In addition to the Italian and ek signification of the Latin word, the literal and tive application of each expression is given in ction of examples, in themselves a perfect ndium of knowledge, embracing the customs, arts, sciences, religion, and history of the mans. This immense work was published in 4 folio, under the title, *Totius Latinitatis Lexicon, et cura Jac. Facciolati, opera et studio Aeg. rcellini Lucubratum* (Padua, 1771). Furlanetto's ndix appeared in 1816 (Padua), and a new n of the complete work was published in (Padua). F. died in 1768.

'ENE, said, in Heraldry, of a horse when ng, or standing on his hinder legs.

EPS (Lat. a pair of tongs or pincers), the given by surgeons to an instrument of great nity, used as a substitute for the fingers, and isting of two levers of metal jointed together swise, nearer to one end than the other. The grasping the longer ends of the levers or les, closes the shorter ends, which are shaped so as to seize firmly the intended object. There is scarcely a surgical operation in which it is not applied; and it is made of various forms, to suit different cases. In addition to the forms used in Dentistry (q. v.), there is, e. g., the *dissecting* forceps, which has roughened points, to lay hold of small portions of tissue which are to be divided by the knife; the *lithotomy* forceps, again, has blades concave like spoons; and *fenestrated* forceps have apertures in the blades, and as the soft tissues project into these, a firm hold is obtained with less risk of tearing the parts. By means of Liston's *cutting* forceps, a powerful hand can divide a great thickness of bone. But the most important of all is the *midwifery* forceps, an invaluable invention, in cases of difficult delivery, which daily rescues from suffering and danger numerous mothers and infants. It was gradually brought to its present perfection; but the name of Chamberlen, an accoucheur of the time of James II., is associated with it, as one of its chief improvers. It consists of two concave fenestrated blades, forming a cavity into which the head of the child fits. The blades are applied separately, one to each side of the head, and then locked together. Holding by the handles, the accoucheur aids the natural efforts of labour. The instrument does not necessarily or generally injure either mother or child.

FORCING, in Gardening, is the artificial application of heat to accelerate vegetation. The term is not usually applied to the cultivation of exotic plants in hothouses, where the object is to imitate as much as possible their native climate; but it is strictly applicable to the system usually pursued with vines and pine-apples, to secure the production of fruit at desired seasons, and by different plants of the same kind in succession through a considerable period, the heat being increased for one set of plants sooner than for another. Many of the fruits and vegetables which grow well in the open air, are very commonly *forced*, in order that they may be procured at seasons when they could not without artificial means. Thus, sea-kale and rhubarb are forced by means of the heat produced by heaps of fermenting litter, by which at the same time they are blanched, and to this we owe their appearance in the market very early in the season. Potatoes, pease, kidney-beans, asparagus, salads, &c., are often forced by means of hotbeds, or in flued pits; or a place is found for them in hothouses. Strawberries are cultivated in pots, and forced in hothouses; and some kinds of fruit-trees are often treated in the same way, particularly cherries; and very diminutive trees may be seen richly loaded with fruit. Certain varieties are regarded by gardeners as particularly suitable for forcing. The system pursued in the Orchard-house (q. v.) cannot be called forcing.

FORD, FORDING. When a river or rivulet is crossed without the aid of either a bridge or ferry, it is said to be forded, and an established place for this crossing is called a ford. Thus, we have Oxford, Stratford, Deptford, Hungerford, &c., towns built around ancient fords. To the military engineer and the traveller in wild countries, the selection of the safest place for fording a river is a matter of some practical importance. In the first place, the *widest* part of the river should be chosen, as, wherever a certain quantity of water is flowing, the wider its bed (the rapidity of the flow being the same) the shallower it must be. At the bend of a river, the line of shallow water does not run straight across, but extends from a promontory on one side to the nearest promontory on the other. The stream usually runs deep along hollow curves, and beneath steep perpendicular and overhanging banks, whilst it is always shoal in front of promontories, unless the promontory is formed by a jutting rock. For safe fording on foot, the depth of water should not exceed three feet; on horseback, four feet; or a foot less for each, if the current be very strong. The bottom of a ford should be firm and even; weeds, blocks of stone, &c., are serious obstacles, especially for cattle. When a caravan, a number of troops, or of cattle, have to cross, a sandy bottom is very bad, for the sand is stirred up and carried away by the stream, and renders the ford impracticable for the hindmost. For a small party, hard sand or gravel is the safest bottom.

The inhabitants of a district generally know the safest fords, and their experience affords a better guide than the best rules that can be given. Fords are contiually varying, either from the swelling of the river or the shifting of its bed or banks, and therefore it does not follow that the place set down by one traveller as a safe ford, will continue so for the next that succeeds him.

FORD, John, an English dramatist, was the second son of Thomas Ford of Ilsington, in the county of Devon. The date of his birth is not known, but he was baptized in Ilsington Church, 17th April 1586. His family was connected with the famous Lord Chief Justice Popham, and he became a member of the Middle Temple in November 1602; his cousin, a John Ford also, at the same period being a member of Gray's Inn. Unlike many members of the poetic tribe, F. seems to have adhered to his studies, and to have attained some professional success. His first poem was an elegy on the death of the Earl of Devonshire, entitled *Fame's Memorial*, and subsequently he assisted in the composition of various plays; perhaps, from his conjunction with Webster and Decker, in this way he acquired, or at least whetted, his appetite for tragic horrors. In 1629, he produced *The Lover's Melancholy*; and four years after, *The Broken Heart*, and *Love's Sacrifice*. Next year came *Perkin Warbeck*; and in 1638—1639, *The Fancies Chaste and Noble*, and *The Lady's Trial*. After this, F. drops out of literary history. Some think that he died soon after; others, that he retired to his native place, married, and lived to an old age, with sons and daughters growing up around him.

F. takes high position as a dramatist, and this position he attains more by general mental force than by dramatic instinct, or by what we are accustomed to call poetic genius. In his compositions, there is a sense of effort; his writing looks like taskwork; and one can hardly suppose that he enjoyed his work. His versification—even when the subject-matter is distinctly noble—is hard and prosaic. He has no humour. He has been praised for his pathos, but in his pathetic scenes effort is apparent. He cannot 'flatter' you to tears, as Shakspeare and the greater poets do. An edition of his works, published by Edward Moxon of London (1840), is enriched by a biographical notice and critical estimate from the pen of Hartley Coleridge.

FORDUN, John of. Nothing more is certainly known of this early Scottish chronicler, than that he was a secular priest, and wrote about the year 1380. It has been inferred from his name that he was born at Fordun, in Kincardineshire, and it has been said that he was a canon of the cathedral church of Aberdeen. Having proposed to himself the compilation of a chronicle of Scotland, he is said to have travelled on foot through Britain and Ireland in search of materials. He lived to write only five books of his *Scotichronicon*, bringing the history down to the death of King David [illegible] He left collections extending to the year [illegible] which time he is supposed to have died. [illegible] which John of F. had left unfinished was [illegible] the year 1441 by Walter Bower, abbot of [illegible] tery of Austin Canons Regular, at Inch Colm's Inch, in the Firth of Forth. [illegible] the five books which F. had complet[illegible] use of his collections so far as they [illegible] new books, bringing the *Scotichron*[illegible] murder of King James I. in 1437. [illegible] other annals has given more [illegible] than it could claim fr[illegible] are scanty enough. It [illegible] once, the most complete e[illegible] all's, published at Edinbu[illegible] This includes both F. and Bower. [illegible] of F.'s work, as it was left by him [illegible] Hearne's, published at Oxford in 1[illegible] room for a new edition, which should [illegible] of the best manuscripts, and disti[illegible] own, what he copied from other[illegible] interpolated into his text.

FORE (i. e., first), a term applied to [illegible] or foremost part of a ship. The *fore*[illegible] part of the hold intervening betw[illegible] and the foremast. The *foreca*[illegible] the upper deck extending from [illegible] bow; it is the part to which [illegible] have free access, and probably d[illegible] a small turret or castle placed [illegible] ancient vessels, from which darts and [illegible] tiles could be most conveniently hurl[illegible] enemy. *Foremast* is the first of the thre[illegible] of the two, when only that number are [illegible] is surmounted by the foretop [illegible] for[illegible] mast, and foreroyal; its sail[illegible] topsail, &c.; between it and the b[illegible] staysail, hoisted on the forestay, a [illegible] passing from the foretop to the bow, a[illegible] backstays and shrouds, maintaining th[illegible] perpendicular position. The *forebrace*[illegible] passing from the extremities of the fo[illegible] the maintop, whence they descend thr[illegible] to the deck, where they serve, [illegible] to alter the direction presented by [illegible] the wind.

FORECLO'SURE, in English Law [illegible] which a mortgagor failing to repay t[illegible] on the security of an estate, is comp[illegible] his right to redeem the estate. Every [illegible] mortgaged his estate, is entitled t[illegible] redemption, which can only be cut [illegible] process. For this purpose, the mo[illegible] of foreclosure, praying that an accou[illegible] of the principal and interest due unde[illegible] and that the mortgagor, on [illegible] feit his equity of redemption. [illegible] for payment, the money be not [illegible] mortgagor will be declared to hav[illegible] equity of redemption, and [illegible] allowed to retain the esta[illegible] MORTGAGE.

FOREHAND RENT. In [illegible] said to be forehand when it [illegible] the crop, of which it is the [illegible] After the period when it is [illegible] hand rent is *in bonis* of the [illegible] executor, not his heirs (Bell's [illegible]

FO'REIGN ATTA[illegible] ence either to person or prop[illegible] has been arrested or attache[illegible] may be again arrested in [illegible] ground of action. Thus, [illegible] been arrested abroad on ed and came to England, the Court of Queen's h decided that he may be holden to bail in an on the judgment. But after an arrest in nd or Scotland, the defendant cannot, in general, gain arrested in England for the same debt, er of these countries being deemed foreign to effect (Wharton's *Dic.*). Under the same name, ceeding for securing the debts due to the dant has been immemorially used in the cities ondon and Bristol (Stephen's *Com.* iii. p. 663, ; and by the C. L. P. Act of 1854, a similar pro- ng has been adopted, but with this difference, whereas by a foreign attachment in the Lord r's Court, debts are attached for the purpose mpelling the defendant to appear and put in o the action, no such proceeding can take place e common-law courts till after judgment. See ACHMENT. In Scotland, where a creditor may incarcerate a debtor and attach his effects, nglish creditor may attach the property of his r, though he has imprisoned him in England. ATTACHMENT, APPREHEND, ARREST, FOREIGN ra. The corresponding phrase in Scotland is ment, which has reference both to person goods, and is a proceeding at common law le to the whole country. As to the validity tch arrestment, *ad fundandam jurisdic-* to enable the Scotch courts to proceed a foreigner though absent, see the recent case of the London and North Western av Co. v. Lindsay, Macqueen, iii. p. 89.

IGN AUXILIARIES. In the early f English history, foreign auxiliaries were ans uncommon. Harold had a body of his army when he defeated the Norwe- ; and to their refusal to march against d Normans he owed not the least among ications which ultimately overwhelmed ung to modern times, William III. had ime a body of Dutch troops in his pay as England; throughout the 18th c., Hessian Hanoverian regiments were constantly in the he English government for temporary pur- Hessians fought for us in the first American and the Landgrave of Hesse, who sold his at so much a head, received upwards of half n for soldiers lost in the campaign. During sh rebellion, again, in 1798, many Hessian were employed.

the outbreak of the continental war in 1793, a determined to recruit the British army by ition of a large body of foreigners; and gly, in 1794, an act passed for the embodi- of the 'King's German Legion,' consisting of men. These troops, who were increased in se of the war to nearly double that number, hed themselves in various engagements, d some of the regiments on which our ould best rely. Corps of French *émigrés*, rk Rangers and others, were also organised. le of the foreign legions were disbanded in officers being placed on half-pay.

the Russian war, in 1854, the British again had recourse to the enlistment of , special provision being made in the rising their employment, that the aries were in no case to be used t L h subjects, in the event of internal d. numbers to be raised were 10,000 ans, 5000 Swiss, and 5000 Italians; the pay to same as to British troops, but temporary to convey no claim to half-pay. About half umber of men were enrolled, and were said to reached great efficiency, when the stoppage of ities arrested their progress, and caused them disbanded at a great cost for gratuities, &c.

An attempt was made to locate the Germans as military settlers on the frontier of Cape Colony, where they should at once be a protection against the Kafirs, and a valuable addition to the labour in the eastern provinces; but partly from the paucity of females in their community, and partly from the temptation to abscond, offered by the high wages in other parts of the colony, Stutterheim, as the settlement was called, has had indifferent success. Many of the soldiers of the Italian legion subsequently turned their training to good account under Garibaldi.

Troupes étrangères form a permanent portion of the French army, where they are held in good esteem; they are usually Swiss, who are always willing to sell their services to any power, whatever the cause, provided only that the pay is good. The throne of the late Neapolitan monarchy was latterly upheld chiefly by Swiss mercenaries.

FOREIGN BILL OF EXCHANGE is a bill which is either both drawn and accepted abroad; or drawn by a person residing abroad on a person in this country, or the reverse. If a bill be drawn abroad, and accepted in England, it does not require a stamp; but if drawn in this country upon a correspondent abroad, or a foreign house, it must be stamped (19 and 20 Vict. c. 97, ss. 6 and 7); and when drawn abroad, it must be stamped by the holder, before he can present it for payment, or indorse, transfer, or otherwise negotiate it within the United Kingdom (Chitty on *Bills of Exchange*, 72). It has, however, been decided that the stat. 17 and 18 Vict. c. 83, s. 3, does not render a stamp necessary where a bill drawn abroad has been indorsed abroad to a person in England, and presented by him for acceptance in England (Phillimore, *International Law*, iv. 609). Formerly, a bill drawn or payable in Scotland or Ireland, was foreign in England; but such bills were made inland by the statute just mentioned; and the same regulation was extended to the islands of Man, Guernsey, Jersey, Alderney, and Sark (s. 7). See BILL. It has been established as a rule in England, that the liabilities of the drawer, the acceptor, and indorser, shall be governed by the laws of the countries in which the drawing, acceptance, and indorsement respectively took place (Phillimore's *International Law*, iv. p. 606 and 596). In the case of bills which are both drawn and accepted abroad, and which are thus in reality foreign contracts, but of which the acceptor is a native of this country, and which are sought to be enforced in the courts either of England or Scotland, a distinction is made between the contract and the remedy: 'Whatever relates to the nature of the obligation—*ad valorem contractus*—is to be governed by the law of the country where it is made—the *lex loci*; whatever relates to the remedy, by suits to compel performance, or by action for a breach—*ad decisionem litis*—is governed by the *lex fori*—the law of the country to whose courts the application is made for performance or for damages.'—Lord Brougham in Don v. Lippman, House of Lords, 26th May 1837; Shaw and Maclean, ii. p. 723.

FOREIGN COURTS. Kent, after stating that in cases not governed by the constitution and laws of the United States, the doctrine of the English law, as to the force and effect to be given to foreign judgments, is the law of his own country also, observes, that the law thus common to England and America 'is exceedingly, if not peculiarly liberal, in the respect which it pays to foreign judgments, in all other cases except the case of a foreign divorce or an English marriage. A distinction was early taken by Lord Nottingham, and is now recognised both in England and America, and indeed almost everywhere else, between a suit brought to enforce a foreign judgment, and a plea of a foreign judgment in bar of a fresh suit for the same cause. As the effect to be given to a foreign judgment is altogether a matter of comity, in cases where it has not been regulated by positive treaty, and no sovereign is bound to execute within his own dominions a sentence given out of it, the rule adopted, where a suit is brought to enforce a foreign judgment, is that the foreign judgment is to be received, in the first instance, as *primâ facie* evidence of the debt, but that the defendant is entitled to impeach the justice of it, or to shew that it was irregularly and unduly obtained. But the case is different where the losing party comes forward and wishes to institute a new suit upon the same matter, and to open up a foreign judgment dismissing the action, pronounced by a competent court. In this case, to interfere with the foreign judgment would be to assume the attitude of a court of review, and the rule in England, consequently, is that such a decision, when given by a foreign court, is final and conclusive. So obvious, indeed, is the convenience and necessity of this rule, that it has been regarded as forming a portion of general jurisprudence.'—Kent's *Com.* ii. 101, 102. As regards the enforcement of foreign decrees and judgments, the usages of nations have differed considerably, and the subject is far too wide and too difficult to admit of being satisfactorily discussed in this work. The distinction between the recognition of the judgment of a foreign court, as determining the validity of a foreign contract, and the application of a foreign remedy by the courts of this country, has been pointed out under Foreign Bill of Exchange (q. v.). For practical purposes, however, it may be convenient that we should state that, contrary to the popular belief in England, the French courts are in the habit of giving effect to judgments obtained in England, and that debtors cannot escape from their creditors, as is too generally supposed, by simply crossing the Channel. The difficulty, no doubt, still exists where the debtor has escaped before any proceedings could be taken against him in this country, and where no judgment can be obtained. But if he has once been served with process in England, or cited either edictally or otherwise in Scotland, the creditor may go on with his action against him though he be personally absent from the country, and ultimately enforce his decree against him by the interposition of a French court. The same observations apply to Belgium. In England, there is no regular office, as in Scotland, for the publication of citations to persons abroad (see EDICTAL CITATION), but leave to substitute service at the last place of abode, in place of personal service, may now be obtained in some cases from the courts, or leave may be granted to serve out of the jurisdiction. In most countries, the rule as to two foreigners resident but not domiciled is, that they may sue each other in the ordinary courts, as natives do. To this the French courts are an exception, and hold themselves incompetent to entertain suits between undomiciled foreigners relating to personality, except in matters of commerce (Phillimore, *International Law*, iv. 645). See JURISDICTION; DOMICILE; INTERNATIONAL LAW, PRIVATE; CONFLICT OF LAWS, &c.

FOREIGN ENLI'STMENT ACT. In the law of England, there is a statutory prohibition of enlistment in the service of a foreign prince in 3 Jac. I. c. 4, s. 18; but the statute commonly known as the Foreign Enlistment Act is 59 Geo. III. c. 69. It provides that if any natural-born Englishman shall enter into the service of any foreign state, either as a soldier or a sailor, without
the licence of his majesty, or an o
or royal proclamation, or if any
the British dominions hire or attemp

LAWS, in England, laws for the regu- the royal forests. Forest is defined by Coke to be a safe preserve for wild animals of the chase, whence comes the term *foresta*, change of *e* into *o* (*Co. Litt.* 233 a). Both probably spring from the same root as the *foris* and the French *hors*, and signify that is *without* the range of the peopled or culti- country. Hence the Italian *forestiere* and , and the Spanish *forastero*, signify strange, wild, and the like. A forest, in the of the law of England, is a large tract of ground, not necessarily covered with wood, ally containing woodland interspersed with , and forming part of the property of the , and governed by a special code, called est law. This particular law had reference to matters connected with hunting and but generally governed the persons living forest in all their relations. A chase is forest, in the hand of a subject, but not by forest law. Though the privilege of ngs of right to the sovereign alone, it nted by him in favour of a subject, who titled to exercise the privileges of forest trict assigned. This right was exercised saxon kings, who reserved large tracts of for the royal pastime of hunting, and a of the forest was said to have been passed at Winchester in the year 1016. But nticity of this document is doubted by (*Inst.* iv. 320). William the Conqueror nded the royal forests, by laying desert ts in Hampshire and Yorkshire; he duced penalties of the severest kind for against the game. The penalty for killing boar was loss of eyes; for William loved game as if he had been their father (*Sax.* cle). It was not till the reign of Henry III. laws of the forest were reduced into a regular In the reign of that monarch was passed the of the forest, 9 Henry III. (A.D. 1224). The of the sovereign to create a forest is by the n law confined to lands of his own demesne. II. had arbitrarily exercised his power by ting the lands of his subjects; but by the 1st chapters of the charter of the forest, it is d that all forests so made should be dis- ted. At a subsequent time, when Henry VIII. created Hampton Court Forest, he was obliged to obtain the consent of the freeholders before he could erect a chase or forest over their grounds (Coke, *Inst.* iv. 301). Mr Hallam remarks: 'It is well known that Charles I. made Richmond Park by means of depriving many proprietors not only of their common rights, but of their freehold lands. It is not clear that they were ever compensated; but I think this probable, as the matter excited no great clamour in the Long Parliament.'—Hallam, *Const. Hist.* i. 463, note, 1st ed. By the charter of the forest, the penalties for destroying game are greatly modified. By cap. 10, it is provided that no man shall lose life or limb for slaying deer, but that the punishment shall be restricted to fine or imprisonment for year and day. Cap. 11 contains the following curious privilege: 'Whatsoever archbishop, bishop, earl, or baron, coming to us at our commandment, passing by our forest, it shall be lawful for him to take and kill one or two of our deer by view of our forester if he be present; or else he shall cause one to blow an horn for him, that he seem not to steal our deer; and likewise they shall do returning from us.' This law is still unrepealed; so that a bishop may kill the Queen's deer when summoned to, or returning from parliament. Charles I. attempted to fill his empty exchequer by imposing penalties and exacting fines for alleged encroachments on the ancient boundaries of the forests, though the right to the lands thus taken was fortified by possession for several centuries. This was one of the first grievances with which the Long Parliament dealt, and since the passing of the act for the 'certainty of forests' (16 Car. I. c. 16), the laws of the forest have practically ceased. In Coke's time, there were sixty-nine royal forests, all of which, with the exception of the New Forest and Hampton Court Forest, had been created before the period of record. Of these, the principal were—the New Forest, Sherwood, Dean, Windsor, Epping, Dartmoor, Wichwood, in Oxfordshire, Salcey, Whittlebury, and Rockingham, in Northamptonshire, Waltham, in Lincolnshire, and Richmond, in Yorkshire. During the present reign, several of the royal forests have been disafforested by act of parliament—Hainault, 14 and 15 Vict. c. 43; Whittlewood, 16 and 17 Vict. c. 42; Wichwood, 19 and 20 Vict. c. 32. Public necessity is the plea on which these spots, long so famous for their silvan scenery, have been condemned. The plea is one which cannot be altogether disregarded; but it is to be hoped that it will not be suffered to prevail to the entire destruction of our royal forests, some of which, from their vicinity to large towns, afford resorts for public recreation highly prized by the citizens, and which never can be equalled in beauty and in healthfulness by any new-made pleasure-ground.

The royal forests of Scotland, in ancient times, seem to have been nearly as numerous as those of England. In Perthshire, there were the forests of Athole, Mamlorn, Glenartney, Glenfynlas, Glenalmond, Birnam, Cluny, Alyth, &c. In Forfarshire, there were Platan, Montrethmont, Kilgerry; in Kincardineshire, Cowie and Durris; in Aberdeenshire, the Stocket, Dyce, Kintore, Benachie, Drum, Birse, Braemar; in Banffshire, the Boyne and the Enzie; in Morayshire, Darnaway, &c. South of the Forth, there were the forests of the Torwood, Cadzow, Ettrick, Selkirk, Jedburgh, Traquair, the New Forest in Dumfriesshire, &c. The *Leges Forestarum*—the Scottish Forest Laws—have been printed more than once; the best edition is in *The Acts of the Parliaments of Scotland*, vol. i. pp. 323–328 (Edin. 1844). The forest code of Scotland, though neither so complete nor administered with the same rigour as that of England, was still generally complained of for its severe penalties or vexatious restraints. The grant of a right of forestry conferred the same privilege as if the ground over which it extended had been originally, and had continued to be, a king's forest. Hence arose great oppression and annoyance to neighbouring proprietors, and in 1680 the supreme civil court suggested that a representation should be made to the king against the granting of new forests. From a case which has just been decided, it would seem that the high pretensions of royal foresters have in some places survived to the present day. The Dukes of Athole still hold the extensive mountainous district called the forest of Athole, either in their own right or as foresters for the crown. In virtue of his rights of forestry, the present duke claimed the power of preventing his neighbour, the Laird of Lude, from killing deer on his own lands, and maintained that he was bound to allow the duke and his keepers to enter on his lands, and drive back any deer that might stray upon them from the forest of Athole. But the court decided (March 1, 1862) against the duke on both points.

Forest Courts were courts established for the purpose of enforcing the forest laws in the royal forests. Of these courts, there were in England four—viz., the Court of Attachments, the Court of Regard, the Court of Swainmote, and the Court of the Lord Justice in Eyre in the Forest, or Justice Seat. The last Court of Justice Seat that was held where business was transacted was in the reign of Charles I., before Lord Holland.

FOREST MARBLE, a member of the Lower Oolite, so called because of the occurrence of the typical beds in Wichwood Forest, Oxfordshire. The principal bed is a fissile limestone, containing large numbers of dark-coloured shells, and capable of sustaining a fine polish. On this account, it is used to some extent as 'marble.' It is interstratified with blue marls and shales, and fine oolitic sandstones. The whole thickness of the group seldom exceeds forty feet.

FOREST OAK, a name sometimes given in commerce to the timber of *Casuarina torulosa*, and other species of *Casuarina* (q. v.), Australian trees. This timber, which is light yellowish brown, and prettily marked with short red veins, is imported into Britain, and used for ornamental work.

FORESTS. See ARBORICULTURE.

FORESTS, FOSSIL, have been frequently observed in the coal measures. The seams of coal having in general been formed from the vegetation of the locality where they occur, it is to be expected that when the coal is removed, the stools and roots of the trees would be observed in the immediately subjacent bed of shale—the ancient soil. Such a forest was laid bare in an open work at Parkfield Colliery, near Wolverhampton, in 1844. In the space of about one-fourth of an acre, the stumps of 73 trees, with their roots attached, appeared as shown in the annexed ground-plan. The trunks, broken off close to the root, were lying prostrate in every direction, often crossing each other. One of them measured 15, another 30 feet in length, but they were generally shorter. They
converted into coal, and flattened
of 1 or 2 inches. The upright st
some of them had a circumference
feet. Similar fossil forests have been
the coal-fields of Nova Scotia, and have be
fully described by Lyell, Logan, and Daw

**RFEITURE AND CORRUPTION OF
OD** are penalties consequent on convictions for treason or felony. The penalty of forfeiture for treason is founded on this consideration, that he who hath thus violated the first principles of government, and broken his part in the original contract between king and people, hath abandoned his connection with society, and hath no longer any right to those advantages which before belonged to him purely as a member of the community (Stephen's *Com.* iv. 497). The penalty of forfeiture for treason prevailed in England before the Conquest, as is clear from the fact, that lands held in gavelkind, which is a Saxon tenure, may be forfeited for treason. But after the Conquest, forfeiture of lands and goods came to be regarded as the peculiar punishment of felony, of which treason against the sovereign was the highest kind, and was denominated high treason, to distinguish it from all other felonies, which were called petty treason. In cases of treason, the offender forfeits all his lands absolutely to the crown. In felony, according to the old law, the offender forfeited to the crown the profits of all estates of freehold during his life, and all his estates in fee-simple for a year and a day, after which they became escheat to the lord. The crown, during the year of occupancy, was entitled to commit upon the lands what Waste (q. v.) it pleased. By *Magna Charta*, this power of committing waste was restrained. But by 17 Ed. II. c. 16. the king's title to waste was again recognised. As the law now stands, murder is the only felony by which forfeiture for year and day is incurred. In all felonies, the goods and chattles of the offender are, on conviction, forfeited to the crown; but until conviction, forfeiture of the goods does not operate. Where, therefore, a person has disposed of his goods before conviction, the crown cannot reach them. Forfeiture of lands does not take effect until sentence of Attainder (q. v.) has been pronounced. So that a person committing *Felo de se* (q. v.), or a rebel dying before sentence, or killed in open rebellion, does not forfeit his lands. But sentence of attainder, as soon as pronounced, has a retro-active effect, and annuls all conveyances made between the act of treason or felony and the pronouncing of sentence. Conveyances made before the act of treason are not affected. Hence, a wife's jointure is not forfeited, because settled on her before the commission of the act. But dower is forfeited by 5 and 6 Ed. VI. c. 11. Counterfeiting the coin was formerly treason; but by various statutes, it is provided that the wife's dower should not be forfeited, and that the lands should be forfeited only for the life of the offender. Forfeiture for treason and felony is accompanied by *corruption of blood*, whereby the offender is incapable of inheriting any lands or of transmitting any title to an heir. But where the lands were not vested in the offender at the time of the act, they are not forfeited to the crown, but to the overlord. In England, this distinction is of little moment, except in copyhold lands, the crown being, in fact, the overlord of nearly all the freehold land in the kingdom. By 7 Anne, c. 21, it was enacted that, after the death of the Pretender and his sons, no attainder for treason should operate to the prejudice of other than the offender himself; but this provision was repealed, 39 Geo. III., c. 93. But in Scotland, where subinfeudation still subsists, the distinction is of practical importance. In Scotland, before the Union, forfeiture of estate was incurred on account of treason and certain other crimes, as theft by a landed man, and uttering false coin. Lord Stair is of opinion that the doctrine of corruption of blood did not prevail in Scotland to exclude those claiming, through a person attainted, where the offender was only apparent heir (Stair, iii. 3, 38). Since the Union, the law of Scotland in regard

to forfeiture for treason has been assimilated to that of England.

In America, forfeiture of estate for crimes is very much reduced, and the corruption of blood is universally abolished. Several of the state constitutions have provided that no attainder for treason or felony shall work corruption of blood or forfeiture of estate, except during the life of the offender, and some of them have taken away the power of forfeiture absolutely, without any such exemption. Every person convicted of any manner of treason, under the laws of New York, forfeits his goods and chattels, and also his lands and tenements, during his lifetime; but the rights of all third persons existing at the time of the commission of the treason, are preserved. Kent's *Commentaries*, ii. 505.

FORFEITURE OF LANDS was originally a penalty of the feudal law, incurred on account of some act by the tenant inferring disloyalty to his overlord. The acts inferring forfeiture might be of either a civil or a criminal nature. Forfeiture for crimes was incurred by treason or felony. See FORFEITURE AND CORRUPTION OF BLOOD. Civil forfeiture may be incurred in England in three ways—viz., by tortious alienation, by wrongful disclaimer, and by alienation in mortmain; the first two of these modes were incidents of the feudal tenure, the latter was introduced by statute. It must be observed that, according to the earliest feudal customs, a gift of lands was always made in favour of a particular person, and that alienation, without consent of the overlord, involved a forfeiture of the fee. But this strictness having by degrees ceased to be observed, forfeiture was only incurred in case of a tortious alienation. Tortious alienation was where the owner of a particular estate conveyed by common law conveyance, as feoffment, fine, or recovery, a greater estate than that to which he was himself entitled, as where a tenant-for-life made a feoffment in fee. The immediate effect of this act was the forfeiture of the land to the remainder man or reversioner. By 3 and 4 Will. IV. c. 74, abolishing fines and recoveries, and 8 and 9 Vict. c. 106, s. 4, declaring that a feoffment should not have a tortious operation, forfeiture by tortious alienation has ceased to have a practical importance. Forfeiture by wrongful disclaimer was where a tenant holding under a superior lord, on being summoned in any court of record, either disclaims his allegiance, or does any act which amounts to a disclaimer. Since the abolition, by the statute of *quia emptores*, of subinfeudation, this species of forfeiture can only arise in lands held of the crown. Forfeiture by alienation in mortmain is incurred by the conveyance of lands or tenements in favour of any Corporation (q. v.), sole or aggregate, ecclesiastical or temporal. As by vesting the land in a tenant of this description, the overlord was deprived of all the duties and services due by his vassal, this act was declared by various acts of parliament to infer the forfeiture of the lands. See MORTMAIN. Forfeiture of copyholds was incurred by committing waste, and by other acts of a wrongful kind inconsistent with the fealty due to the lord. See Blackstone, *Com.* ii. 284. Forfeiture on breach of condition, subsequent is where an estate is held upon a condition contained in the grant itself. On failure of the condition, the grantor or his heirs may enter upon the lands.

In Scotland, civil forfeiture may arise either from statutory enactment, at common law, or by agreement. By 1597 c. 246, it is enacted that vassals failing to pay their feu-duties for two years shall forfeit their right. This forfeiture must be established by an action to recover the feu-duties in arrear, and may be avoided by payment at the bar. At common law, a vassal forfeited his land by disclamation or purpresture. The fo

ET-ME-NOT, or **SCORPION GRASS**
), a genus of annual or biennial her-
plants, of the natural order *Boraginea*,
eft calyx and salver-shaped corolla; the flowers small, and generally blue. The genus is diffused over the temperate zone in all quarters of the world, and a number of species are common in Britain, chiefly growing in ditches and damp meadows—as *Myosotis palustris*, with crooked creeping perennial roots—an angular stem of a foot in height, and calyx covered with appressed bristles. *M. sylvatica*, with calyx covered with stiff spreading hairs, grows in bushy places and woods, and is often planted in flower-gardens. The dark blue F. of the Azores (*M. Azorica*) has of late begun to be cultivated in Europe, but requires the green-house. The genus is a favourite one with most persons, both because of the brilliancy of the flowers, and because throughout Europe it is generally regarded as the emblem of friendship. The English name Scorpion Grass is now seldom heard. The German name *Vergissmeinnicht* corresponds with the English *Forget-me-not*.—*M. versicolor*, very common in Britain, often as a weed in gardens, is remarkable for the change of colour in the flowers, which are first yellow, then blue. They are very small.—*M. alpestris*, found on some of the mountains of Scotland, is especially admired for the size and brilliancy of its flowers.

FORIO, a thriving town of Italy, is picturesquely situated on the west coast of the island of Ischia, which stands at the northern side of the mouth of the Bay of Naples. The central portion of the town consists of very narrow streets, but the suburbs are composed of charming white cottages. It has three highly decorated churches, a good harbour, and some trade with Leghorn, Naples, and Genoa. Pop. 5791.

FORISFAMILIATION (literally, the putting forth from or beyond the family) is the separation of a child from the family of his father. A child is said to be forisfamiliated, either when he marries or when he receives from his father a separate stock, the profits of which are enjoyed by himself, though he may still reside with his father, or when he goes to live in another family with the consent of his father. The same result is also brought about when a child renounces his *legitim*, i.e., his legal share of the father's free movable property due to him on the death of the latter. See Bell's *Dic. of the Law of Scotland.*

FORKS. These table instruments are only about three centuries old. The Greeks, Romans, and other ancient nations knew nothing of forks. They had large forks for hay, and also iron forks for taking meat out of pots, but no instruments of the nature of table-forks. In ancient times, as is the practice still in the East, meat was commonly prepared as stews; or if roasted, it was cut into small pieces by a carver, so as to be easily taken in mouthfuls by the guests, who used their fingers and a knife for the purpose. It certainly is a strange fact, that the use of any species of forks at table was quite unknown till the 15th c., and they were then known only in Italy, which has the merit of this invention. None of the sovereigns of England had forks till after the reign of Henry VIII.; all, high and low, used their fingers. It was accordingly a part of the etiquette of the table to employ the fingers so delicately as not to dirty the hand to any serious degree; but as even by the best management the fingers were less or more soiled, it was the custom to wash the hands immediately on the dishes being removed from the table. Hence, in the royal household, there was a dignitary called the *Ewrar* or *Ewary*, who with a set of subordinates attended at meals with basins, water, and towels. The office of Ewary survived after forks came partially into use. We learn that when James I. entertained the

Spanish ambassador at dinner, very shortly after his accession, 'their majesties washed their hands with water from the same ewer, the towels being presented to the king by the lord treasurer, and to the queen by the lord high admiral.' The Prince of Wales had a ewer to himself, which was after him used by the ambassador.—Ellis's *Letters*. The first royal personage in England who is known to have had a fork was Queen Elizabeth; but although several were presented to her, it remains doubtful whether she used them on ordinary occasions. From the inventory of her majesty's appointments in Nichols's *Progresses*, it would appear that these forks were more for ornament than use. '*Item*, a knife and a spoune, and a forke of christall, garnished with golde sleightly, and sparcks of garnetts: given by the Countess of Lyncolne. *Item*, a forke of corall, slightly garnished with golde: given by Mrs Frances Drury. *Item*, one spoune and forke of golde; the forke garnished with two lyttle rubyes, two lyttle perles pendant, and a lyttle corall: given by the Countess of Warwicke.' These ornamental forks had doubtless been presented to the queen as foreign curiosities of some value, and were probably never used at table. As yet, and for a considerable time afterwards, forks were not in common use, a circumstance less attributable to ignorance of the invention, than to prejudice. So far was this prejudice carried, by even educated persons, that one divine preached against the use of forks, as being an insult to Providence not to touch one's meat with one's fingers!

Italy, as has been said, claims the merit of this useful invention. This fact is explicitly learned from an account of a tour in Italy by a traveller named Thomas Coryate, who visited that country in 1608. His travels, styled *Crudities*, were published first in 1611, and republished in 1776. In these *Crudities* appear the following passages respecting the Italian towns: 'I observed a custom in all those Italian cities and townes through which I passed, that is not used in any other country that I saw in my travels; neither do I think that any other nation of Christendom doth use it, but only Italy. The Italian and also most strangers do always at their meals use a little forke when they cut their meat. For while with their knife, which they hold in one hand, they cut the meate out of the dish, they fasten the forke, which they hold in their other hand, upon the same dish; so that whatsoever he be that sitting in the company of others at meals, should unadvisedly touch the dish of meat with his fingers, from which all the table doe cut, he will give occasion of offence unto the company, as having transgressed the laws of good manners, in so much that for his error he shall be at the least browbeaten, if not reprehended in wordes. This form of feeding, I understand, is generally used in all places of Italy; their forks being for the most part made of yron, steele, and some of silver, but these are used only by gentlemen. The reason for this curiosity is, because the Italian cannot by any means indure to have his dish touched with fingers, seeing that all men's fingers are not alike cleane. Hereupon, I myself thought good to imitate the Italian fashion by this forked cutting of meate, not only while I was in Italy, but also in Germany, and oftentimes in England since I came home; being once quipped for that frequent using of my forke, by a certain learned gentleman, a familiar friend of mine, Mr Laurence Whitaker, who in his merry humour, doubted not to call me at table *furcifer*, only for using a forke at feeding, but for no other cause.' The term here employed jocularly, was in its serious meaning one of reproach, having been applied by the Romans to those slaves
who as a punishment bore a forked
(*furca*), resembling an inverted Λ—hence
forca and *forchetta*; the latter (little f
followed in the French term *fourchette*,
former is the root of the English word '

FORMA PAU'PERIS, the phrase
ployed both in England and Scotland
arrangements by which an action
on by one who is too poor to sue
way. In England, the statutes 11 He
and 23 Henry VIII. c. 15, provid
will swear themselves not w

wearing apparel and the matter in question in the cause, shall be exempt when plaintiffs, but not when defendants, from the payment of court-fees, and shall be entitled to have counsel and attorney assigned to them by the court without fee. They are further excused from costs when unsuccessful; a privilege which, according to Blackstone, amounted in former times only to the rather uncomfortable alternative of choosing between paying and being whipped. In the event of success, however, a person suing in this form is entitled to his costs, because his counsel and agent, and the officers of court, though they are bound to give their labour gratis to him, are not bound to give it on the same terms to his antagonist, unless he too be a pauper. To prevent the abuse of suing in the superior courts at Westminster in this form in matters of small amount, it is provided (19 and 20 Vict. c. 108, s. 30), subject to certain exceptions, that any plaintiff who resorts to one of these, in a case falling within the c uzance of a county court, and recovers no more £20, or in some cases £5, shall have no costs, unless he satisfies the court or a judge that he had sufficient reason for taking that course. There are some other exceptions to the rule (see Stephen's *Com.* iii. p. 646).

In Scotland, this benevolent arrangement was duced by statute more than half a century e the date of the English act we have men ed. In 1424, the statute (c. 45), which we have ady quoted under Advocate (q. v.), was passed the purpose of securing professional assistance, to the poor, and for giving to them and those sted them their costs in the event of success. e special arrangements applicable to litiga this form in Scotland will be detailed under Roll (q. v.).

MATION, in Geology, is applied to a group a united by some character which they have on, whether of age, origin, or composition, al or chalk formation.

FORMEDON, an old form of action, in the Law of England, whereby an heir of entail or er man who had been ousted by a discon e, was entitled to vindicate his claim to the from which he had been ousted. By 21 James I. , it was enacted that writ of formedon should brought within twenty years of the time when cause of action arose. Writ of formedon is now ed, together with other real actions.

FORMIC ACID (C_2HO_3,HO) derives its name the circumstance of its having been first ed from the *Formica rufa*, or red ant. In a entrated state, it is a fuming liquor with an ting odour, and occasions vesication if dropped the skin. It crystallises at a temperature w 32°, and boils at about 212°, yielding a vapour h burns with a blue flame. It is a strong cing agent, at a boiling temperature reducing the of silver, mercury, platinum, and gold.

may be obtained in various ways, as, for example: By the distillation of red ants with water (a ceeding never adopted now). 2. By the distilla of a mixture of starch, binoxide of manganese, huric acid, and water; this is the usual method, various organic matters, as sugar, chaff, bran, dust, &c., may be substituted for the starch. the distillation of oxalic acid mixed with , or far better (according to Berthelot), with erine: 1 equivalent of oxalic acid ($C_4O_6,2HO$) ding 1 equivalent of formic acid (C_2HO_3,HO) + 2 valents of carbonic acid ($2CO_2$).

rthelot has recently obtained it synthetically by ng carbonic oxide gas for a prolonged period contact with hydrate of potash, at a temperature of 212°. The gas becomes gradually absorbed, and formate of potash is the result, the reaction being exhibited by the formula, 1 equivalent of hydrate of potash (KO,HO) + 2 equivalents of carbonic oxide (2CO) = 1 equivalent of formate of potash (KO,C_2HO_3).

Formic acid is a very common product of the oxidation of organic bodies; thus, for example, the albuminates, glycine, sugar, starch, &c., yield it in association with other products, when acted on by chromic acid; the fats and fatty acids yield it when acted on by nitric acid; and it is a product of the action of ozone on glycerine, fats, fatty salts, acetic acid, and sugar, provided a free alkali is present. Hence, we can readily explain its occurrence as a product of oxidation in the animal organism, in which it not unfrequently occurs, either free or in combination. Thus we find it not only in ants, but in the poison of the bee and wasp, and in the hairs of the procession caterpillar. It has been detected by various chemists in the sweat, in the expressed juice of the spleen, pancreas, thymus gland, and muscles, in the brain, the blood, and the urine.

The salts of formic acid, which are termed by some chemists formates, and by others formiates, require no special notice. They are all soluble, and yield a red colour with persalts of iron.

FORMICA. See ANT.

FORMING'S ISLAND is a speck on the bosom of the Pacific, lying a little to the north of the Sandwich Group, or Hawaiian Archipelago, in lat. 30° 49′ N., and long. 159° 20′ W. It is one of the most recent additions to the British empire, having been formally occupied, mainly on account of its excellent harbour, towards the close of 1860.

FORMOSA (Chinese name, *Tai-wan*), a large island on the south-east coast of China, opposite the province of Fokhien, from which it is distant about 90 miles. It lies between 21° 53′–25° 16′ N. lat., and 120° 15′–122° 4′ E. long. The length of F. is about 237 miles, and its average breadth about 70 miles. A chain of mountains running north and south nearly bisects the island. The eastern side is held by the aborigines, a number of independent savage tribes. The western side, having an area of about 14,000 square miles, is under Chinese jurisdiction, the Chinese having gained possession of it in 1683, and is a department of the province of Fokhien. It is occupied by Chinese settlers. Tai-wan (q. v.), the capital, in 23° N. lat., and on the western coast, was opened to foreign commerce by the treaty of Tien-tsin, June 26, 1858. Coal abounds at Kelung and is largely shipped. In recent years tea has been extensively cultivated; other products are camphor, rice, maize, sugar, tobacco, cinnamon, pepper, &c.; oranges, pine-apples, guavas, cocoa-nuts, pomegranates, as well as grapes, peaches, &c., are abundant.

FORMS OF ADDRESS. Many persons are exposed to inconvenience from their ignorance of the formal modes of addressing letters to persons of title; we shall therefore, in the present article, give an enumeration, taken mainly from Mr Dod's *Peerage and Baronage*, of the usual ceremonious modes of written address. Previous to their employment, the writer must, of course, learn either from the peerage-writers, or from some other source, the precise rank of the person whom he wishes to address, as well as the hereditary, personal, or official distinctions by which that rank is often modified.

1. *Archbishop*—Letters are addressed: 'His Grace, the Lord Archbishop of ——,' and commence: 'My Lord Archbishop.' More formal documents are addressed 'The Most Reverend Father in God (John Bird), by Divine Providence, Lord Archbishop

of Canterbury;' other archbishops and suffragan bishops being 'by Divine permission.' When personally referred to, an archbishop is styled 'Your Grace,' not 'Your Lordship.' The Archbishop of Armagh is addressed as 'His Grace the Lord Primate of Ireland.'

Archbishops' wives, and the other members of their families, enjoy no titles, as such.

2. *Baron*—Addressed: 'The Right Honourable Lord ——;' referred to as 'His Lordship,' or 'Your Lordship.'

Baron's Daughter—'The Honourable Mary ——;' or, if married, 'The Honourable Mrs ——.' Letters commence, 'Madam.'

Baron's Son—'The Honourable John ——.' Letters commence, 'Sir.'

Baron's Son's Wife—'The Honourable Mrs ——.' Letters commence, 'Madam.'

Baron's Wife, and *Baroness* in her own right—'The Right Honourable Lady ——;' in strictness, but more commonly, 'The Lady ——.' Letters commence, 'Madam,' and refer to her as 'Your Ladyship.'

Baronet—'Sir John ——, Bart.' Letters commence, 'Sir.'

Baronet's Wife—'Lady ——.' Unless she has a title as the daughter of a peer, no Christian name is used. She is referred to as 'Your Ladyship.'

Bishop—'The Right Reverend the Lord Bishop of ——.' Letters commence, 'My Lord.' Frequently the address is simply, 'The Lord Bishop of ——.' The style in formal documents is, 'The Right Reverend Father in God (John ——), by Divine permission, Lord Bishop of ——.' Scotch bishops are addressed 'The Bishop of ——,' sometimes as 'The Right Reverend Bishop (e. g., C. H. Terrot)', and letters commence, 'Right Reverend Sir.' The colonial bishops are addressed by their territorial titles, like those of England.

Bishops' Wives and Children have no titles.

Countess—'The Right Honourable the Countess of ——.' Letters commence, 'Madam,' and refer to her as 'Your Ladyship.'

Duchess—'Her Grace the Duchess of ——.' Letters commence, 'Madam,' and refer to her as 'Your Grace.'

Duke—'His Grace the Duke of ——.' Letters commence, 'My Lord Duke;' and he is referred to as 'Your Grace.'

Duke's Daughter—'The Right Honourable Lady Mary ——,' or less formally, 'The Lady Mary ——.' Letters commence, 'Madam,' and refer to her as 'Your Ladyship.' If she is married to a person of inferior rank, her surname only is changed.

Duke's Eldest Son—Uses the second or some other title of his family by courtesy, and he is addressed as if he held the title by law, though in formal documents he is called '——, Esq., *commonly called* the Marquis or Earl' (as the case may be).

Duke's Younger Son—'The Right Honourable Lord John Russell,' or less formally, 'The Lord John R——.' 'My Lord,' and 'Your Lordship.'

Duke's Younger Son's Wife—'The Lady John ——,' unless where she has a title in her own right. 'Madam,' and 'Your Ladyship.'

Earl—'The Right Honourable the Earl of ——,' or less formally, 'The Earl of ——.' 'My Lord,' and 'Your Lordship.'

Earl's Daughter—Like Duke's Daughter (q. v.).

Earl's Eldest Son is addressed as if the title which he holds in courtesy were a title in law.

Earl's Younger Son—Like Baron's Son (q. v.).

Earl's Younger Son's Wife Like Baron's son's wife, unless of superior rank to her husband.

Earl's Wife. See *Countess.*

KING—'The King's Most Excellent Majesty.' 'Sire,' and 'Your Majesty;' or, in les
thus: 'Mr Pill presents his duty to y

Knight Bachelor—Like Baronet (q. v.),
the word 'Bart.' is omitted.

Knight Bachelor's Wife—Like Baron
(q. v.).

Knight of the Garter—K.G. is added to
or other title of the bearer.

Knight of St Patrick—K.P. used in
manner.

Knight of the Thistle—K.T.

Knight of the Bath—if a Knight G
K.G.C.B.; if a Knight Commander, K.

Knight of the Bath's Wife—Like
Baronet or Knight Bachelor.

Lord Advocate (*of Scotland*)—'The Rig
able the Lord Advocate' by courtesy; bu
documents he is styled 'Her Majesty's A
Scotland.' Letters ought strictly to comm
not 'My Lord,' though the latter mode of
the more usual.

Lord Lieutenant (*of Ireland*)—'His
the Lord Lieutenant;' and letters c
accordance with his rank in the peer
wise. If a duke, he is styled 'His G
Lieutenant.'

Lord Mayor—'The Right Honourabl
Mayor.' 'My Lord,' and 'Your Lo
are only three Lord Mayors—tho
York, and Dublin.

Lord Provost—The Provost of Edin
Right Honourable the Lord Provost;'
'The Honourable the Lord Provost;'
of Aberdeen, 'The Lord Provost.'
other Lord Provosts. Perhaps the
the title of the chief magistrate of
capital is traceable to his having b
member of the Privy Council of Sc
least the period of the Revolution.

Lord of Session (in Scotland)—'The
Lord ——.' 'My Lord,' and 'Your I

Lords of Her Majesty's Treasury—
collective capacity are addressed as
able the Lords Commissioners of He
Treasury;' individually they have no
their connection with the Treasury.

Maid of Honour—'The Honourable
'Madam.'

Marchioness—'The Most Honourable
chioness of ——.' 'Madam,' and 'Your

Marquis—'The Most Honourable th
of ——,' *not* 'The Most Noble.' I
'My Lord Marquis;' but when per
he is styled 'My Lord,' and 'Y

Marquis's Daughter—Like D

Marquis's Eldest Son—Like
(q. v.).

Marquis's Younger Son, like Duke's Yo
(q. v.).

Mayors—In formal documents, '
shipful the Mayor ——;' but in lett
Mayor.'

Members of Parliament—The
added to their usual address.

Officers in the Navy and Army—
service is always prefixed to any
may possess, thus: 'Captain the Lord

Prince—'His Royal Highness Pri
'His Royal Highness the Duke of ——
Prince is also a Duke. In pe
H.R.H. are usually substituted f
letter begins 'Sir,' not 'My Lord
mode of reference is 'Your Royal

Princess—'Her Royal Highness
or 'The Duchess' (as the case m
and 'Your Royal Highness.'

Prince's Wife, though of inferior rank, like a Princess by birth.

Privy Councillor.—'The Right Honourable John

-

Privy Councillor's Wife and Children have no title.

QUEEN.—'The Queen's Most Excellent Majesty.' 'Madam,' and 'Your Majesty;' or, 'The Lord John R presents his duty to your Majesty.'

Viscount.—'The Right Honourable Lord Viscount ,' or less formally, 'The Lord Viscount.' 'My Lord,' and 'Your Lordship.'

Viscountess.—'The Right Honourable the Viscountess,' or less formally, 'The Viscountess,' 'Madam,' and 'Your Ladyship.'

Viscount's Daughter, like Baron's Daughter (q. v.).

Viscount's Son, like Baron's Son (q. v.).

Viscount's Son's Wife, like Baron's Son's Wife (q. v.).

The formality of these modes of address experiences considerable modifications when employed by persons of equal rank. Between friends and relatives, they are either entirely dispensed with (except, of course, in addressing letters), or adapted to the feelings and caprices of the writers. In this, as in many other respects, we of the present generation are far less ceremonious than our fathers, and still more than our grandfathers were. In most old letters, it will be found that the titles of the writers are preserved even where there is the freest and st familiar interchange of thought and feeling. ves address their husbands, and husbands their ves, children their parents, and occasionally even ents their children, as 'Sir' or 'Madam,' 'My Lord,' or 'Your Royal Highness,' as the case may be.

FORMS OF PROCEDURE. See PROCESS.

FORNICATION (*fornicatio*, from *fornix*, an h-vault, and by metonymy, a brothel, because thels at Rome were in cellars and vaults under). In most countries, this crime has been t within the pale of positive law at some al of their history, and prohibited by the impo- n of penalties more or less severe; but it has s been found ultimately to be more expedient ast to the restraints which public opinion se on it in every community which is guided by rinciples of morality and religion. In England, during the ascendency of the Puritan party, repeated act of keeping a brothel or committing ication was made felony without benefit of y on a second conviction. At the Restoration, a the crime of hypocrisy seemed for a time to be only one which, under the influences of a very al reaction, men were willing to recognise, this nt was not renewed; and though notorious d open lewdness, when carried to the extent of citing public scandal, continued, as it had been dore, an indictable offence at common law, the re act of fornication itself was abandoned 'to the ble coercion of the spiritual court, according the rules of the canon law, a law which has ated the offence of incontinence with a great deal tenderness and lenity, owing perhaps to the con- ined celibacy of its first compilers.' *Blackstone*. proceedings of the spiritual court were regu- ed by 27 Geo. III. c. 44, which enacts that the t must be instituted within eight months, and it cannot be maintained at all after the mar- of the parties offending. But proceedings in cclesiastical courts for this offence have now n into entire desuetude (Stephen's *Com.* iv.). In Scotland, shortly after the Reformation, nication was prohibited by what Baron Hume ls 'an anxious statute of James VI.' (1567 c. 13), tled 'Anent the Filthie Vice of Fornication, and Punishment of the samin.' This act, which was passed in the same parliament by which incest and adultery are punished with death, provides that the offender, whether male or female, shall pay for the first offence a fine of £40 Scots, and shall stand bareheaded, and fastened at the market-place, for the space of two hours; for the second, shall pay a fine of 100 merks, have the head shaven, and shall be exposed in the same public manner; and for the third, pay a fine of £100, be thrice ducked in the foulest pool of the parish, and be banished the town or parish for ever. There is but one instance of this statute having been enforced by the Court of Justiciary, which occurs, as might be supposed, during the government of the Protector in Scotland. The offence of keeping a house of notorious ill-fame and scandalising the neighbourhood, is punishable in Scotland as a police offence. See NUISANCE and PROSTITUTION.

FORRES, a royal burgh in the county of Elgin or Moray, situated on a well-marked old sea-terrace and promontory, distant about two miles from the mouth of the river Findhorn (q. v.). Pop. (1871) 3959. It was a royal burgh in the reign of King David I. (1124–1153), and was subsequently the seat of the Archdeacon of Moray, who had as his prebend the church of Forres, dedicated to St Laurence the martyr, and the church of Logynfythenach (now Edinkillie), dedicated to St John the Baptist. A painting of St Laurence holding in his hand the gridiron on which he is said to have been roasted, is preserved at Brodie House near Forres. The antiquities of the place are the remains of its castle, at the west end of the town, now surmounted by a monument, erected to the memory of Dr Thomson (a native of Cromarty, distinguished by his eminent medical services in the Crimean war), and the remarkable sculptured pillar—25 feet high—sometimes called Sueno's Stone, but more commonly 'the Stan'in' Stane,' which stands about a mile to the eastward. A monastery of black friars is said to have stood formerly on the site now occupied by Anderson's or the Forres Academical Institution. F. lies at the foot of a curiously formed group of four gravelly hills, named the Cluny or Cleeny Hills, evidently water-made, on the highest of which, the site of an old encampment, an octagonal tower 66 feet high, was erected to the memory of Nelson in 1806.

FORSTER, JOHN, an English political and historical writer, was born at Newcastle in 1812. He was educated for the bar, but early, like so many other law-students, devoted himself to periodical writing. In this sphere of literature he displayed more than usual ability; and his political articles in the London *Examiner*, for which he commenced writing in 1834, attracted more attention than is usually bestowed on newspaper leaders. There was a vigour and point about them, coupled with a truth, consistency, and outspoken honesty (the three latter qualities being more rare in newspaper writers a quarter of a century ago than they are now), which obtained a wide renown for the paper. F. became editor of the *Examiner* in 1846, an office which he still discharges. He is the author of many admirable biographical and historical essays, and we are indebted to him for much new and valuable information tending to elucidate obscure points, and correct erroneous notions about the times and statesmen of the English Commonwealth. It is to this period of history that F. has chiefly directed his studies, and no person desirous of properly understanding it, should neglect his *History of the Grand Remonstrance*, *Arrest of the Five Members*, and *Lives of the Statesmen of the*

Commonwealth. His literary memoirs are also excellent. The chief are *The Life and Times of Oliver Goldsmith* (1848); *Walter Savage Landor*, a biography, 2 vols. (1868); *The Life of Charles Dickens*, 3 vols. (1871—1873). F.'s style is clear, forcible, and elegant. He was appointed Secretary to the Commissioners in Lunacy in 1856.

FORSTER, Johann Reinhold, a German traveller and naturalist, was born in Dirschau, in Prussia, in 1729, and died at Halle in 1798. He was educated at Halle and Danzig for the clerical profession, and in 1753 became pastor at Nassenhuben, near Danzig; but he seems to have devoted most of his time to the study of mathematics, natural philosophy, natural history, and geography. In 1765, he accepted an offer made to him by the Russian government, to inspect and report upon the new colonies founded on the banks of the Volga; and the matter of his report is said to have been so good as to have given to the Empress Catharine suggestions for her great code of laws. His irritable temper soon involved him in difficulties with the Russian government; and in the following year he repaired to England, where the exertions of some of his scientific friends in London soon procured for him the office of teacher of natural history, and of the French and German languages, at an educational institution for dissenting clergymen at Warrington, in Lancashire. He retained this post until 1772, when he received, through the influence of Mr Banks, the offer of naturalist to Captain Cook's second expedition to the South Seas. In the course of the voyage, his temper seems to have frequently brought him into unpleasant collision with the other officers; and after the return of Captain Cook's vessels in July 1774, a controversy arose between F. and Lord Sandwich on the question as to who should write the narrative of the voyage. It was finally settled that F. should write the philosophical, and Cook the nautical parts of the work; but further difficulties arose, and Cook's journal appeared alone. In 1776, in association with his son, he published a work (in Latin) on the botany of the expedition; and in 1778 his *Observations faites dans un Voyage autour du Monde sur la Géographie Physique, l'Histoire Naturelle, et la Philosophie Morale* appeared. In the latter year, he returned to Germany, and was soon afterwards made Professor of Natural History and Mineralogy at Halle, where he remained until his death. In addition to the works mentioned, he published *De Bysso Antiquorum*, 1775; *Zoologia Indica*, 1781; *Geschichte der Entdeckungen und Schiffahrten im Norden*, 1784 (translated into English and French), &c.

FORSTER, Johann Georg Adam, commonly known as George F., eldest son of Johann Reinhold Forster (q. v.), a German traveller and naturalist, was born at Nassenhuben, near Danzig, in 1754, and died at Paris in 1794. When only 17 years of age, he accompanied his father in Captain Cook's second voyage; and shortly after his return, he published, with the assistance of his father, an account of the expedition. His book, which does not differ materially in its facts from Cook's narrative, was well received by the public, and was translated into French, German, Swedish, and other languages. Humboldt speaks of this work and of its author, 'my celebrated teacher and friend, George Forster,' in the highest terms in the *Cosmos* (see vol. ii. p. 437, Bohn's ed.). F. having returned to the continent, was made Professor of Natural History at Cassel, and afterwards at Wilna. Having there no access to books, in 1788 he gladly accepted the office of librarian to the Elector of Mayence. After Mayence was taken by t in 1792, F., who had become an ardent s was sent as a deputy to Paris, to request poration of Mayence with the French While he was in Paris on this mission, the retook Mayence, and F. lost all his including his books and manuscripts. writes to a friend: 'If I could only scra £400, I would learn Persian and Arabi overland to India to gather new expe about this time he seems to hav from rheumatic gout, which gr severity, and which terminated of January 1794. Besides nu and the account of Captain most important works are *Kleine Sch Beitrag zur Länder- und Völkerkunde, schichte und Philosophie des Leben* (6 vo 1789—1797), and *Ansichten vom Nieder Brabant, Flandern, Holland, England,* reich (3 vols., Berlin, 1791—1794). His daughter of Heine, but perhaps more wid as Therese Huber, published a collect Letters, in 2 vols., in 1828—1829; and edition of his works, in 9 vols., was pu his daughter and Gervinus, in 1843.

FORSTER, Thomas Ignatius Maria, meteorologist and physicist, born in 1789, and died in 1850. In 1812, he e university of Cambridge; in the follow produced an annotated edition of Ar 1816 he edited an edition of Catullus. published *Observations on the Influence States of the Atmosphere on Hu Diseases*; in 1824, *The Perennial C The Pocket Encyclopædia of N* a work which has elicited the Quetelet and Humboldt; in 1836, *l'Influence des Comètes*; and in 1850, *Physicien Voyageur.* A work entitled *Forsterianum*, consisting of a collectio letters from eminent men, preserved in family, was published after his death, in 1852.

FORT, a term of peculiar meani North America, applied to a tradi wilderness with reference to its defences, however slight, against the barbarism. It has thus been often designate merely a palisaded log-hut, oasis of civilisation in a desert larger, than Scotland.

FORT, FORTRESS (from Lat. stronghold, made secure by walls, further protected by a ditch and para construction of forts, see Fortifica

FORT ADJUTANT, an appointment in a fortress— often composed of drafts fr analogous to that of adju responsible to the com ant discipline, and the app duties to particular corps. officers, and receive in o a ance per day in addition ir ordi pay.

FORT AUGUSTUS, a village at th of Loch Ness, 29 miles south-west of I fort, intended to overawe the Highla here soon after the rebellion of 1715. eminence on the loch. It men, but is commanded by It was taken by the re the head-quarters of the the battle of Culloden.

a bastion at each of the four corners. The twelve six-pounders formerly mounted here have been removed, but a few soldiers are generally stationed at the fort.

FORT GEORGE, a fortification in the north-east of Inverness-shire, on a low sandy projection into the Moray Firth, here only one mile broad, opposite Fortrose, and nine miles north-east of Inverness. It is the most complete fort in the kingdom, and was built, at a cost of £160,000, soon after the rebellion of 1745, to keep the Highlanders in subjection. It covers twelve acres, and can accommodate 2000 men. It is an irregular polygon, with six bastions, and upwards of 70 guns. It is defended by a ditch, covert-way, a glacis, two lunettes, and a ravelin. It has casemated curtains, 27 bomb-proof rooms, bomb-proof magazines, and is supplied with water from eight pump-wells. It is, however, only secure from attack by sea.

FORT GEORGE (INDIA). See MADRAS.

FORT MAJOR, the next officer to the governor or commandant in a fortress. He is expected to understand the theory of its defences and works, and is responsible that the walls are at all times duly protected. He is on the staff, and receives 9s. 6d. a day in addition to his half-pay.

FORT ROYAL, a fortified seaport of the French island of Martinique, in the West Indies, is the capital of the colony. It stands on the west coast, in a bay of its own name, in lat. 14° 35′ N., and long. 61° 4′ W. It has a population of about 12,000, and contains offices for the local government, barracks, arsenal, and hospital.

FORT ST DAVID, on the Coromandel or east coast of Hindustan, belongs to the district of South Arcot and presidency of Madras. It is three miles to the north of Cuddalore, and 100 to the south of Madras, in lat. 11° 45′ N., and long. 79° 50′ E. The place became British in 1691. It occupied a prominent position in the great struggle for supremacy between England and France. From 1746 to it was the capital of the settlements of the former power on the Carnatic; but soon afterwards, fortifications having been demolished, it sank to comparative insignificance.

FORT WILLIAM, a village in Inverness-shire, near the west base of Ben Nevis, 63 miles south-west of Inverness, and at the south end of the Caledonian Canal. A fort was originally built by General Monk, and afterwards rebuilt on a smaller scale by William III. It is an irregular work, with ditch, glacis, ravelin, bomb-proof magazines, and barracks for 100 men. It resisted sieges the Highlanders in 1715 and 1745. It was one of the old keys to the West Highlands, and is now y inferior to Oban as a centre for tourists to explore these romantic regions.

FORT WILLIAM (INDIA). See CALCUTTA.

FORTÉ, in Music, the Italian term for loud; *fortissimo*, as loud as possible.

FORTESCUE, SIR JOHN, an eminent judge and writer on English law, descended from a Devonshire family, was the son of Sir Henry Fortescue, Lord Chief Justice of Ireland, and was born some time in the reign of Henry IV. Educated at Exeter College, Oxford, he was called to the bar at Lincoln's Inn, and in 1441 was made serjeant-at-law. The following year, he was appointed Lord Chief-justice of the of King's Bench. In the struggle for the crown between the Houses of York and Lancaster, he firmly adhered to the latter, and is supposed to have been for a time Lord High Chancellor of England. Lord Campbell, in his *Lives of the Lord Chancellors* (i. p. 307), under date February 17, 1461, says: 'If Sir John Fortescue ever was *de facto* chancellor, and in the exercise of the duties of the office, it must have been now, after the second battle of St Albans, and at the very conclusion of the reign of Henry VI.' In March of that year, he fought at the battle of Towton for that monarch, and was attainted by the parliament under Edward IV. He accompanied the queen, Margaret of Anjou, and her young son, Prince Edward, on their flight into Scotland, and while there wrote a treatise in support of the claim of the House of Lancaster to the English crown. In 1463, he embarked with the queen and her son for Holland, where he remained for several years, intrusted with the education of the young prince. During his exile, he wrote his celebrated work, *De Laudibus Legum Angliæ*, for the instruction of his royal pupil. In the introduction, and throughout the dialogue, he designates himself 'Cancellarius.' It was when he was in Scotland that the title of Chancellor of England is said by some to have been conferred upon him by the dethroned monarch. He probably had the titular office of chancellor *in partibus* during his exile, but never exercised the functions in England. In 1471, he returned with Queen Margaret and her son; but on the final defeat of the Lancastrian party at the battle of Tewkesbury, where he is said to have been taken prisoner, finding that parliament and the nation had recognised the title of Edward IV., he submitted to that monarch, and, as a condition of his pardon, wrote a treatise in favour of the claim of the House of York. He was allowed to retire to his seat of Ebrington, in Gloucestershire, where he died in his 90th year. His male representative was, in 1789, created Earl Fortescue and Viscount Ebrington in the peerage of Great Britain.

FORTH, a river of Scotland, rises in the north-west of Stirlingshire, in the mountains between Loch Katrine and Loch Lomond, from two main branches, the Duchray, 16 miles long, from the east side of Ben Lomond, and the Avendhu, 12 miles long, flowing through Lochs Chon, Dhu, and Ard. These streams unite at Aberfoyle, and issue from the mountains. The F. then runs east and south-east along the borders of Perth and Stirling shires, with numerous windings, in a wide valley abounding in picturesque scenery. It passes Stirling, and a little above Alloa it widens out into the Firth of Forth. The F. is only 30 miles long in a straight line from its source to the mouth of the Devon; but, owing to its sinuosities, its real course is more than twice that length. It is navigable for vessels of 100 tons to Stirling. Its chief tributaries are the Teith, the Allan, and the Devon. The upper parts of the F. and Teith traverse some of the most romantic lake and mountain scenery in Scotland.

FORTH, FIRTH OF, an arm of the sea, or the estuary of the river Forth, lies between the counties of Clackmannan, Perth, and Fife on the north, and those of Stirling, Linlithgow, Edinburgh, and Haddington on the south. It first extends 6 miles south-east from where the Devon joins the Forth; then, with an average breadth of 2½ miles, it runs 10 miles to Queensferry; and finally, it extends 36 miles north-east, gradually expanding in width to 15 miles between Fife-ness and Tantallon Castle on the coast of Haddingtonshire. Its waters are from 7 to 30 fathoms deep, and encircle the Isle of May, Bass Rock, Inchkeith, Inchcolm, Cramond Isle, &c. On the coast, are many fine harbours. St Margaret's Hope, above Queensferry, is one of the safest roadsteads in the kingdom. The chief rivers which fall into the firth are the Forth, Carron, Avon, Almond, Esk, and Leven. The counties along its shore are the most fertile and best cultivated in Scotland, and include the maritime towns of North Berwick, Musselburgh, Portobello, Leith, Queensferry, Grangemouth, Culross, Burntisland, Kirkcaldy, &c.

FORTHCOMING, in the Law of Scotland, is an action by which an arrestment is made available to the arrester. The arrestment secures the goods or debts in the hands of the creditor or holder; by the forthcoming the arrestee and common debtor are called before the judge to hear sentence given, ordering the debt to be paid, or the effects to be delivered up to the arresting creditor. (Bell's *Law Dictionary.*)

FORTIFICATION, a term derived through the Italian from the Latin *fortis* and *facere*, means literally the 'making strong' of any place whatever, be it a town, an arsenal, a camp, a mere house, or the extended position of an army occupying a tract of country, a province, or even a kingdom. In effect, the term is limited to strengthening by means of walls, ditches, or other stationary obstructions, aided more or less by artillery, which may impede hostile advance.

Fortification cannot pretend to render strongholds impregnable, for no works, however skilfully devised, will withstand the continued fire of well-directed artillery, backed by energy and discretion on the part of assailants: its aim is to enable a beleaguered garrison to hold out, without losing ground, until it can be relieved by the advance of allies operating in the field. In fortifying a place, the engineer usually proceeds upon some defined system of entourage; but if he hope for success, his science must be sufficiently elastic to adapt itself to all the natural features of the locality; and from this it follows that a system perfect in theory, and of universal application, will in practice have to undergo modifications, differing in almost every instance.

The origin of the art is involved in an obscurity which history need not hope to penetrate. The earliest records of all nations speak of walled cities and forts.

The prime element of all fortification is the parapet (from Italian *para*, before; *petto*, the breast), which may be a wooden stockade, a wall of masonry, or a mound of earth, and is intended to give more or less cover to the defender from the projectiles of his adversary, while he is still able to use his own weapons against the latter. The simplest form of parapet being the mound of earth, the ground adjoining it would probably be dug up for its formation, and from this would almost unconsciously ensue the ditch, as an additional means of separating the assailant and the assailed. Starting, then, from this parapet and ditch or fosse, as the elementary forms of defence, it will be well, before proceeding to describe the ancient and modern systems, to give concise practical definitions of the parts, adjuncts, and technical names of a fortification.

The first duty of a defender is to prevent, as far as possible, the enemy's near approach to any of his works. In developed systems, this is sought to be done by bastions, &c. (of which hereafter), which stand out at angles to the general line, so as to afford a fire commanding all parts. But as cases occasionally happen of troops, defended by a mere straight parapet and ditch, having to withstand the advance of the enemy, it is necessary to adopt every measure which can obstruct his path, harass his advance, and, if possible, aid in cutting off his retreat in the event of failure.

Abattis (q. v.) are among the simplest obstacles to be improvised, consisting of trees cut down, shorn of their leaves and smaller twigs, having their branches pointed, and then laid close together, in one or more lines parallel to the works, branches outward, and trunks imbedded or pinned down in the earth. Accoutred troops must re before they can pass, and the operation under fire from the besieged is a very indeed.

Chevaux-de-frise (q. v. for derivation a tion) are pointed iron or wooden rods fixed in a wooden beam, and until removed complete obstacle to progress. They are in a breach or other unclosed portion and are now made in pieces, so as to b and yet ready for immediate putting t cheval-de-frise is usually 12 feet long, 9 inches square.

Chausse-trapes, or *Caltrops* (q. v.), g annoyance to troops advancing, and are dangerous in cases of night-attack. The however, more general formerly than it is

Trous-de-loup (wolf-traps), which are dug, and armed at the bottom with sp trees cut down and their stumps pointe harrows, broken sword-blades, bayonet similar annoyances, are resorted to as ex gain time, and thereby insure a more de the assailants. They are frequently co the glacis of a work.

Fraises and Stockades represent anoth additional defence, and are stout posts zontally or perpendicularly into the close rows. Fig. 1 shews the use of b defences in the ditch of a fortress, and it w ceived at once how formidable to an attack solid lines of these posts must be. The forms likewise, at times, a good substitut parapet itself, particularly when the dire artillery is unlikely to be brought against warfare with barbarous tribes, or in a very crest of a steep hill. In this case it constructed of two rows of strong pali imbedded in the ground: the outer square, planted with three-inch interva the second about six inches in diameter spaces behind. Every second small p short a few inches, so as to leave musketry-fire (as in fig. 2). A hill manner is shewn in fig. 3.

The a ing the height of parapet neces- cases will be seen from the next Let A be the position at which is to be made, and AB the space which red to defilade to a height throughout C. D, D_1, D_2, are three points, accord- supposed country round, from which fire ad at the parapet—one, D, being on the thers on ground respectively higher and the parapet: if lines be now drawn points to C, their intersection with a raised on the point A, will shew necessary for the parapet protecting to the height BC. From this, the will be apparent of constructing a range of higher ground, as for a of elevation in the commanding ortionate addition must be made to the the parapet. In practice, the ordinary r a level is eight feet high, which the depressed trajectory of a spend- PROJECTILES. If the parapet be und above the attacking position, it d, according to the angle, to about six , the height necessary for a man be thoroughly protected. On the if the position, A, be lower than the pied by the assailant, the parapet must as 12 feet forms the limit to which can conveniently be thrown up, further ssary for protection is obtained by sinking to be defiladed before the parapet's base. ng for these heights, the instruments used rods, which are fixed in the ground at D the normal height of a man marked third rod at A is then marked at the e the line of sight between the normal he two others intersects it, and so shews of the parapet.

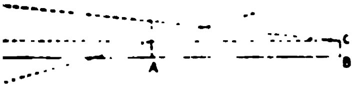

Fig. 4.

going parapet has been provided only as breastwork, deriving its safety solely from in a direct line upon the besiegers; but such a rampart would be exposed to the ge of holding but little command over the rp (part cut away) at its foot; so that, d under cover, an enemy could readily elf therein. To guard against this a work so that the fire of one part shall take in emy advancing against another part. See re ABCDE is a flanked or reciprocally parapet, in which it is evident that the AB, DE, must take in flank any force BC or CD, while the latter also, in like ank AB, DE, themselves. In a flanked this sort, the angles, A, C, E, which rards the country, are technically termed les; those at B and D, *re-entering angles.* d parapet has often, likewise, the power ng larger spaces than the simple line of parapet, since the salient angles can, perhaps, be brought on elevated ground; while the re-entering angles, though with less elevation, may in some degree compensate that defect by greater distance from the front. A disadvantage of flanked defences is, that the hostile fire crosses the parapet at a less angle than in the straight line, and may, therefore, be more deadly; indeed, the object of the assailant will always be to obtain an enfilade fire *along* one or more parapets of the defence, as (in fig. 5) an enemy posted at F, would be able to sweep the complete line of the parapet CB. To avoid this, the engineer who constructs the works must ascertain minutely the elevation of the surrounding points, and make his salients at such angles that the prolongation of his parapets towards the enemy shall always fall on low ground, whence no command can be obtained.

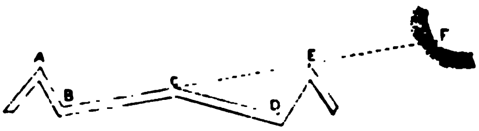

Fig. 5.

Now, where the salient angle becomes somewhat acute, and there is an enemy on both fronts, the soldiers defending the right parapet, and standing on its banquette, would be exposed to a *reverse* or back fire from the enemy in front of the left parapet, beyond the defilading of which they would doubtless be. As a remedy, an internal parapet, called a *traverse*, or, from its duty, a *parados*, is raised between the parapets of the salient, its height being determined on precisely the same principles as were made use of in regard to the original parapets.

Where both the faces of the salient are unavoidably so placed as to be enfiladed, a small work, called a *bonnet*, is constructed at the angle, which consists in the parapet being so raised up to an extra height of twelve feet if necessary, and at the same time widened, that the banquette shall be defiladed. If a height of twelve feet is insufficient to defilade the whole length of the banquette, traversing parapets must be raised at right angles to the face of the work, and within it, at such distances that the whole may be safe: of course, the height of the bonnet and of the traverses must be decided on rules analogous to those explained in fig. 4. The increased height of the parapet of the bonnet renders it necessary to have two or more banquettes at that portion of the work, with steps to aid the ascent (see section in fig. 6); as AB, the crest of the general parapet, with banquette at C; and DE, the bonnet, with banquettes at F and G.

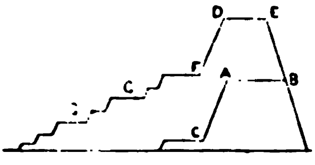

Fig. 6.—Bonnet.

In enclosed works—i.e., in works entirely surrounded by parapets—the position of the parados is of vital importance; and they have often to be devised with great ingenuity, so as to protect the defenders from reverse fire in any direction, and at the same time not to prevent necessary communication between different portions of the fortress.

Relief means the height of any point in a work above the plane of construction, which may be the line of sight or the bottom of the ditch. In the latter case, the relief of the parapet is an important item in estimating the resisting power of a work, as it represents the vertical equivalent of the obstacle which will be offered to a foe.

When the relief of the parapet's crest has been determined, its thickness becomes the next consideration. The dimensions are laid down on the ground, and depend, first, on the angle at which the material to be used will pile; and then, on the nature of the missiles against which the p to afford protection. For example, an eart from three to four feet suffices to resist a thickness of 18 feet is impervious to the 2 while larger guns can pound through ev solid obstructions.

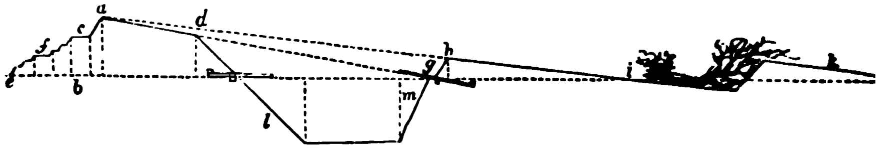

Fig. 7.—Section of Parapet, Ditch, and Glacis.

Taking fig. 7 as an example, in which crest of the parapet, then the banquette for convenient firing, be four feet three inches below *a*; its width three feet, if for a single line of soldiers; four feet six inches for a double rank; its slope should be one in twelve, that water may run freely off. The base, *be*, of the slope, up which the men mount to the banquette, should be twice its height *bc*, and cut into steps with inclined sides, to allow of easy ascent; and where the height is considerable, a supplemental banquette (on which relieving-men can, if necessary, reload), is desirable. The interior slope, *ac*, of the parapet should be one in four; the exterior slope, or *plongée*, *ad*, intended for the direction of the guns on an assailant, one in six, a deviation being permitted between one in nine and one in four; but the crest being more liable to destruction as the slope of *ab* is augmented, it is best to keep it as small as circumstances will allow; one in six is the ordinary slope in English fortification, the angle of the interior slope being constant. In some continental services, however, the angle, *cad*, is kept constant at 100°, by increasing the deviation of the interior slope of the parapet from the perpendicular as the plunge of the exterior is greater. The flatter, however, the crest of the parapet is the better, as sand-bags are in certain cases ranged on it to form cover for the men, while they fire through loopholes left in this additional defence. Earth of medium tenacity maintains its position properly when sloped at an angle of 45°; and this is the greatest angle which can be counted on for the outer slope of the parapet. The scarp, *l*, and counterscarp, *m*, of the ditch need not have so great an incline, as the ground in which they are cut has usually had time, and the footsteps of ages, to consolidate it. In such cases, the base of the triangle is frequently made equal to half the perpendicular. Cases, of course, occur in which steeper banks are considered indispensable; and then, to prevent slips, the earth must have a coating to keep it up, which may be of fascines, hurdles, planks, or sand-bags, for temporary works, or those constructed in the midst of action; while the most solid masonry performs the same function in fortresses of a more permanent nature. This outer coating is denominated a *revêtement*.

In fig. 7, *ghi*, is the *glacis*, formed during the excavation of the ditch, and having for object the bringing of an advancing enemy into the best line of fire from the parapet. The base and perpendicular of its interior slope, *gh*, should be equal; the slope of the outer face should be one in twelve, unless the slope of the ground render some different angle desirable. An advanced glacis, *k* in fig. 7, is sometimes adopted, in order that the enemy may the sooner be brought under fire. It is absolutely necessary that the crest of the parapet should be five and a half feet higher than the crest of the glacis, as, otherwise, an assailant having re latter, would be able to pour a musketry the former into the work. No part of a whether near or advanced, should be two feet below the line of fire from th i.e., the line joining the crests of glacis continued; if more depth enemy may advance in a crouching n being liable to be hit. Advanced made of earth thrown up in prolong ground the plane of the preceding glaci may be defended entirely from the p which case palisades or abattis are often fig. 7) to delay the advancing enemy point of greatest exposure. On these advanced glacis are occasion a series of advanced intrenchmen abandoned, one by one, as the defen in towards their main work.

The dimensions of the ditch measure on the amount of earth parapet and glacis; but in addition mine whence the materials for the are drawn, the ditch must also oppo able obstacle to any hostile advance. To effectually, the minimum width acr 18 feet; its depth need only be trouble of raising the earth; but feet is found the greatest which can be arrived at. Having ascertained the parapet, with its banquette or banqu traverses, glacis, &c., it becomes a mensuration to compute the area of a multiply it by the length, and so to cubic feet of earth required. With th the ditch known, a very simple calc exhibits its width and depth—a being made for the fact that the earth the ditch, where it has probably be pressed, will occupy somewhat more thrown up, and broken into clods, for parapet.

The *scarp*, or inner face of the difficult of ascent by the assailant, tinuous line with the parapet (as in sometimes it would be dangerous to work with this continuity, as damage would jeopardise the stability of the pa these cases a narrow step, called a *Berm* from two to four feet, is made to interv the foot of the parapet and top of the precaution, it is covered with all possib to any lodgment being effected on it b When a berm is employed, greater usually given to the scarp.

The *counterscarp*, or outer ditch, should be somewhat st

The bottom of the ditch should slope from both sides towards the centre, to carry off the water; and obstacles should be scattered about to prevent an enemy from forming his troops in the ditch.

Earthworks in Field Fortification.—As the most readily constructed, earthworks naturally recommend themselves to the engineer, who, in the field, is called upon to defend the position of an army against sudden attack. Their utility has been shewn in their employment from the earliest times; and modern experience tends to prove that earth parapets are of all fortifications among the most difficult to overcome. An army manœuvring before a superior force, can scarcely hope to avoid battle being thrust upon it, unless, strengthened by fieldworks, it be rendered more nearly equal to the adversary. Napoleon, Marlborough, Eugène, Wellington, have given their names as witnesses to the indispensability of such works. The Russian parapets at Borodino made the French victory so inary a triumph that it was useless to the . A few redoubts at Pultowa saved Peter Great from total defeat by his formidable edish rival. The world-famed lines of Torres vedras enabled Wellington with 50,000 troops, half of whom were untried Portuguese, to withstand for months, and ultimately to drive back, the erto victorious army of 70,000 French, under commanders as Masséna, Ney, and Junot. earthworks surrounding Sevastopol partook atly of the nature of fieldworks for the protec- of a large army, and history will not forget to unt the resistance they offered for almost a to the best troops of the civilised world.

r a line, whether of earth or masonry, to be ient, it must combine artillery fire with that of etry. The guns will generally be so placed as command some specific line of approach, such as e, a line of abattis, or some portion of the . They should themselves be as little exposed ossible, nor should the gunners be uncovered than is absolutely requisite. To effect this, is generally made to fire through an *embra-* q. v.) in the parapet, instead of over the latter. embrasure is a cutting through the solid para- 20 inches wide at its inner extremity, and ards half as much as the width of the parapet. ases where it is necessary, for proper command, t the line of fire should not be lower than the of the parapet, the embrasure is made through additional parapet raised, as in the previous of the bonnet, above the original one. The m of the embrasure is called the *sole*, and downward sufficiently to allow of a certain ession being given to the gun. The remainder parapet below the *sole* is the *genouillère* (from , a knee), and in field fortification should be and a half feet high; the portion between embrasures is the *merlin* (Ital. *merlone*, battle- nt); and an embrasure need not cut the parapet pendicularly, an angle being admissible, when oblique fire is necessary. When, however, the obliquity would exceed 70°, it is usual, in order that the thickness of the parapet should not be too much diminished, to form a projecting angle in it, through which the embrasure is cut (as in fig. 8). The sides of the embrasures are *cheeks*, and require revetting.

Fig. 8.

A *barbette* is a platform raised behind a parapet, higher than the general interior, with a view to guns being fired from it over the parapet.

There are certain fixed rules in all fortification, such as:—1. The length of lines must never exceed musketry range, or the flanking-works would become ineffective for their object. 2. The angles of defence should be about right angles. 3. Salient angles should be as obtuse as possible. 4. Ditches should have the best possible flanking. 5. The relief of the flanking-works must be determined by the length of the lines of defence. 6. The value of almost every detached work depends on the support it can give to or receive from an army or other work or works. 7. The reduction of every fortified work is merely a question of time; and a work fairly surrounded is sure to fall, unless relieved from without.

Fieldworks, which, it must be borne in mind, are intended merely to support or strengthen an army, may either have a complete circuit of parapets, or may be open at the gorge in the rear. The latter are, of course, the simplest; but they are only available in positions which the enemy cannot turn, or where protected by the sweeping fire of other works behind. Of this class the *Redan*, a mere salient angle (see fig. 9), is the simplest and the representative form. Of the closed forts, there are *Redoubts*, usually square; *Star-forts*, now considered objectionable; bastioned forts, as in fig. 10, which flank their own ditches almost perfectly, while scarcely susceptible of being flanked themselves. To understand the nature of a single bastion, see A (fig. 10), which represents one at the corner of a square work; *ab* is the left *flank*, *bc* the left *face*, *cd* the right *face*, *de* the right *flank*; *ae* is the *gorge*; *af*, *fe* are the *demi-gorges*, being continuations of the sides, or curtains, of the work; *a* and *e* are the left and right *curtain angles*; *b* and *d*, the left and right *shoulder angles*, and *c* is the *flanked angle*.

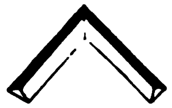

Fig. 9.—Redan.

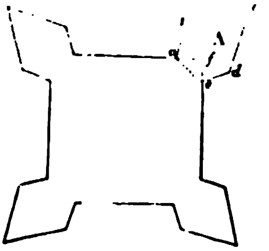

Fig. 10.—Bastioned Fort.

Continued lines are simple parapets, either connecting fortified posts, or covering the front or flank of an army. Redans joined by curtains (as in fig. 11) are those most easily constructed; but as the ditches can only be defended by an oblique fire, the curtains are occasionally so broken as to form nearly right angles with the faces of the redan, as in the dotted line; they then become *lines of tenailles*.

Fig. 11.—Continued line of Redans.

Lines en Crémaillère have long faces with perpendicular flanks. *Lines with intervals* are often as effective as continued lines. They consist of detached works, in two lines, within musketry

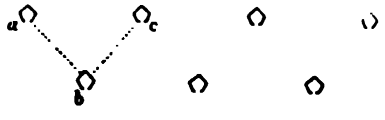

Fig. 12.—Line with intervals.

fire of each other. The re-entering angle, *abc* (fig. 12), should as nearly as practicable be a right angle. The celebrated lines of Torres Vedras, before adverted to, consisted of 150 detached forts.

Tête-du-pont, is a work constructed to cover the approaches to a bridge, and will be found described under BRIDGE-HEAD.

A *tenaille* is the reverse of a redan, and consists of two faces forming a re-entering angle: it can only be used in connection with some other work.

A *flèche* is a breastwork of two faces, forming a salient angle, constructed on the exterior of a glacis, usually at its foot, in order to defend the ground before a bastion or ravelin.

Having now explained the principal forms which elemental works of fortification are made to assume, we proceed to describe—very briefly, of course—the systems into which these have been incorporated for the defence of fortresses, towns, and other permanent purposes. It will merely be necessary to state, in addition to what has been already written, that a *rampart* is a raised structure of earth or stone, above the mean level of the country, on which the parapets, &c., can be thrown up, and which affords to the town or space protected the extra cover of its height, while it elevates the inner works sufficiently to enable them to command and fire over those situated exteriorly to themselves. It need scarcely be said that a line which can be made of earth may equally be constructed of any other material which circumstances may render desirable, the maximum resistance and minimum liability to splinter being the qualities to be chiefly considered.

SYSTEMATIC FORTIFICATION FOR PERMANENT WORKS.—Adverting to the most ancient fortifications mentioned in history, we find Greek cities surrounded with walls of brick and rubble, and occasionally of stone in huge blocks. Babylon had a wall of prodigious circuit—100 feet high, 32 feet thick, and surmounted by towers. Jerusalem, at the time of Vespasian's siege, had similar walls with masonry of enormous solidity. These seem to represent fortification as it stood from the time of that emperor to the introduction of cannon fo purposes. Then the square and round to had formed sufficient flanking defe arrows, proved useless when cannon-balls a distance, were the instruments of assa same time, the walls, which had resisted rams, crumbled to atoms under the artillery.

Fortunately, however, the art of d always made equal progress with and, early in the 15th, if not late the Italians had commenced to fla with small bastions. The bastions a by Micheli in 1523, are usually looked oldest extant specimen of modern f Tartaglia and Albert Dürer, painter an were early in the field. In most of the ear the face of the bastion was perpendicular The first principles were successively Marchi, an Italian, who died 1599, by le-Duc, and De Ville, under Henry IV. XIII. of France. The Count de Pa treatise appeared in 1645, did much tow ishing previous errors, and laid the bas science which Vauban subsequently w to perfection. Born in 1633, Vauban h which penetrated in every direction, eq ways of war and in those of peace. He sibly have taught how fortresses could impregnable, had not the restless master, Louis XIV., led him to de that the reduction of any work was a of time and powder. His talent so im system of attack, that even he himself construct a rampart that should withsta conjured up against it by his discoveries structed 33 new fortresses, improved abo conducted personally more than 50 him are soldiers indebted for the sw ricochet, and to him in a degree for which endeavour to render it harml director-general of the fortresses of Provinces, was the contemporary, rival of Vauban; his master-piece is B

I, re-entering place of arms; K, glacis.

Cormontaigne, Belidor, Montalembert, Bousmard, and Carnot may also be mentioned as conspicuous masters in the science.

Irrespective of irregularities in the form of the place to be defended, a particular polygon is selected as that on which the lines of defence are to be drawn. Each side of this is a *face of* the length of a side is rarely made gre yards.

Vauban's first system is shewn in fig. 1 the outline of its ground-plan; fig. 14 di same in profile.

In this instance, the polygon taken is an octagon. Let *ab* (fig. 13) be a side of this polygon; bisect in *c*, and draw a perpendicular to *ab*. On this, ards, mark off *cC* one-sixth of *ab*; join *aC*, *bC*, produce the lines; then from *a* and *b* respectively mark off *ad*, *bg*, each equal to $\frac{2}{7}$ *ab*, for the faces of the bastions. Next, from *a* and *b* as centres, with radius, *ag*, describe arcs cutting *aC*, *bC*, produced in *f* and *e*; join *de*, *fg*, for the flanks of bastions, and *ef* for the curtain of the work. The

ine of defence is then complete, the necessary ts, &c., being of course raised on the site laid From an examination of this, it will be seen the whole space in the front is covered. The faces of the bastions and the curtain command more or less the entire front, while the bastion flanks sweep along the faces of adjoining bastions and along the curtain. In front, however, of the apex of each

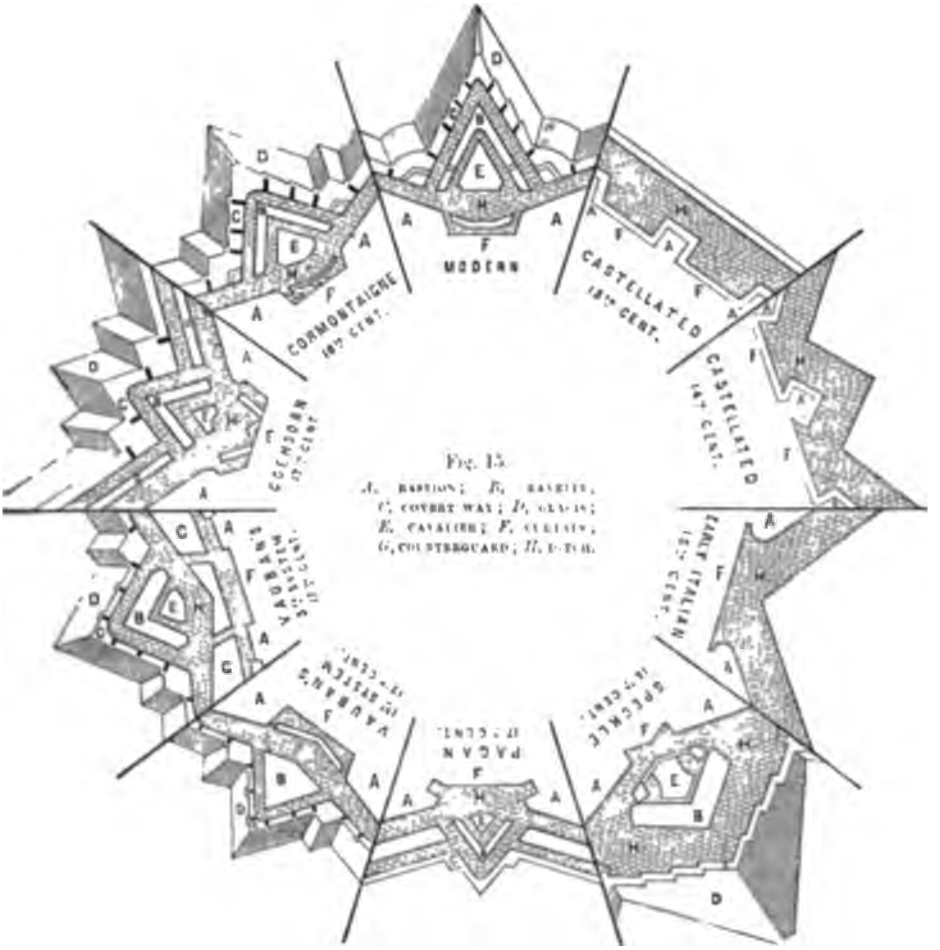

Fig. 15.
A, BASTION; *B*, RAVELIN; *C*, COVERT WAY; *D*, GLACIS; *E*, CAVALIER; *F*, CURTAIN; *G*, COUNTERGUARD; *H*, DITCH.

ion, the line of advance is only covered by an mely oblique fire. To obviate this, a ravelin, constructed on the further side of the main which commands the doubtful fronts, and, at the same time, forms an outwork capable of assisting in the general scheme of defence. To trace the main ditch, describe from the flanked angle of the bastion, *a* or *b*, an arc with radius 30 yards (if dry ditch, 36 if wet), and from these arcs draw tangents to the shoulders, *d* and *g*, of the opposite bastions. These tangents, meeting in the line *cC*, form the counterscarp line of the main ditch. From *h*, the re-entering angle of the counterscarp, set off 100 yards along the perpendicular to *i*, which will be the apex of the flanked angle of the ravelin. From *i*, draw lines to points situated in the faces of the bastions, 10 yards from the shoulder angles; these lines to the points intersecting the counterscarp give the faces of the ravelin. The ditch of the ravelin is 20 yards wide, with counterscarp parallel to the escarp. The zigzag line now arrived at gives the inner side of the covert-way—10 yards wide—behind the glacis, which last slopes gradually towards the country, and is ordinarily the outer work of all. The tenaille is a comparatively low parapet sweeping the depressed interior of the ravelin, and commanded by the bastions and curtain.

The caponnière, forming a communication between the tenaille and the ravelin, consists of a passage between two low parapets, each with a glacis sloping towards the ditch, which is swept from the work.

Nine feet clear are allowed round the traverses on the covert-way; at the re-entering angles of the covert-way, *places of arms* are formed by setting off 30 yards on each side, and with this as gorge, advancing faces inclined to each other at 100°. If the polygon had been a square, *cC* would have been $\frac{1}{8}$ *ab*; if a pentagon, $\frac{1}{7}$ *ab*; and for any polygon of more sides than seven, $\frac{1}{6}$ *ab*.

Vauban's second and third systems were those in which he adapted old walls to his modern improvements. Availing himself of the works already formed, he added counterguards in front of the corner-towers, thereby making hollow bastions, and avoiding the necessity of entirely rebuilding.

Coehoorn's system had counterguards in front of the bastions and parallel to them. The flanked angle of his ravelin had a fixed value—viz., 70°.

Cormontaigne widened the gorge of his ravelin, thereby reducing the length of the bastion face available for breaching from without. He also revived the step-like formation of the covered way, originally seen in Speckle in the 16th c., and which gives defenders a continued line of fire from each traverse along the covert-way.

The modern system differs but little from that of Cormontaigne. The re-entering places of arms have circular fronts instead of angular; the angle of the ravelin is fixed at 60°, and all the best points of older styles are associated.

Fig. 15 is intended to present at one view a representation of the systems in force since artillery came into common use, as well as the gradual transition from square towers on castle walls to flanked bastions on modern lines. The elements of fortifying against shipping will be found under MARINE FORTIFICATION; the principles of attacking fortresses generally, under SIEGE, and MINES, MILITARY.

FORTIGUERRA, NICOLO, an Italian poet, was born at Pistoja, November 7, 1674. Destined from youth for the church, he proceeded to Rome at an early period, where the power of the prelate Carlo A. Fabroni, who was his relative, speedily secured him advancement, and where he was ultimately raised to the dignity of prelate and papal chamberlain by Clement XI. An ardent cultivator and protector of letters, it must be owned that F.'s own compositions are more prized for a certain rich joviality of imagery, and profuse facility of language, than for any salient beauty of style or conception. His chief work, *Il Ricciardetto*, was originally commenced in confutation of friends, who maintained

the *forum boarium* (the cattle-market),
suarium (pig-market), *piscatorium* (fish-
olitorium (vegetable-market), &c. Public banquets for the populace, and the combats of the gladiators, were, in the time of the republic, usually held in the great forum, which also contained monuments of various kinds, of which may be mentioned the famous *Columna Rostrata* of C. Duilius, erected in memory of his victory over the Carthaginians. The rostra, or platforms from which public orations were delivered, formed the boundary between the forum in its narrower usage and the comitium. After the time of Julius Cæsar and Augustus, the Forum Romanorum lost the importance it had previously derived from being the central point of Roman political life. The other two *fora judicialia* were the *Forum Julii* and the *Forum Augusti.* Compare Becker, *Handbuch der Röm. Alterthümer* (1 vol., Leipsic, 1843).

FORUM CO'MPETENS, in Law, is the court to the jurisdiction of which the party is amenable.

FOSCARI, FRANCESCO, Doge of Venice from 1423 to 1457, a brilliant period of conquest and prosperity to his country, and of unexampled affliction to himself and family. Born about 1370, his aspiring ambition soon fired him with passionate eagerness to exalt his reign by the glory of conquest, and speedily involved the state in a severe conflict with the Dukes of Milan; which, however, the doge's great military ability in the end turned into a source of glory and aggrandisement to Venice. His triumph was embittered by the successive loss of three sons; and the one who remained to transmit the name, and succeed to the inheritance of the family, was, in 1445, denounced for having received bribes from the hostile generals, to use his influence with the doge in procuring less rigorous terms. Tried for this grave crime before the Tribunal of the Ten, and racked cruelly in view of his father, Giacopo Foscari was banished for life, under pain of death should he attempt to revisit his native land. In 1450, the assassination of one of the 'Council of Ten,' Hermolao Donati, was imputed, on what seem most unfounded grounds, to Giacopo, who was consequently summoned from his exile, tried, tortured, and banished a second time on still more rigorous terms to the island of Candia. Grown reckless through suffering, and longing to see his home and country on any terms, Giacopo petitioned the Duke of Milan to intercede in his behalf with the senate, a step which, by Venetian law, was punished as a high crime, and led to the unfortunate Giacopo being for the third time subjected to torture and renewed banishment, on entering into which he died of grief. The doge had vainly besought permission to resign a dignity grown loathsome to him, from its imposing the barbarous obligation of witnessing his son's torture; but in the end he was deposed, and ordered to vacate the palace in three days. At the age of 87, decrepit from years, and bowed by sorrow and humiliation, Francesco F., supported by his venerable brother, descended the Giant's Staircase, and passed out for ever from the ducal palace, the scene of such vain pomp and bitter misery. Pasqual Malapieri was elected in his stead in 1457, and at the first peal of the bells in honour of his elevation, F. expired from the rupture of a blood-vessel. Byron has written a tragedy on the subject, entitled *The Two Foscari.*

FO'SCOLO, UGO, an Italian author, was born about 1778, at Zante, one of the Ionian isles, and proceeded to Venice in his 16th year, where for a time he pursued his studies, repairing later to Padua to enjoy Melchiore Cesarotti's noble course of classic literature. His earliest efforts at poetical composition were strictly modelled on his favourite Greek classics; and, as early as 1797, his tragedy, *Il Tieste*, was received with favour by a critical Venetian audience. The dismemberment of the Venetian states, decreed by the treaty of Campo Formio, bitterly incensed F.'s patriotic spirit, and inspired him with one of his most remarkable works, *Le Lettere di Jacopo Ortis*, which, owing to the fierce political excitement then prevailing throughout the entire peninsula, was received with immense popularity. F. repaired to Milan on its being declared the capital of the Cisalpine republic, and there obtained the grade of officer in the Lombard legion. On the downfall of the republic, he retreated with the French into Genoa, where, in the midst of the terrors of a rigorous siege, he composed two exquisite odes to *Luigia Pallavicini Caduta da Cavallo*, and *All' Amica risanata*. F. subsequently entered France with the intention of joining Napoleon's expedition against England, and prepared a much admired version of Sterne's *Sentimental Journey*, to exercise himself in English. On the failure of the plan, he returned to Milan, and prepared a splendid edition of Montecuculi's works, with notes and historical references—*Opere di Raimondo Montecuculi, per* Luigi Mussi (Milan, 1807—1808), a very rare edition. At this time, he also published his exquisite poem, in blank verse, *I Sepolcri*, which at once placed him among the classic authors of his country. In the same year, he was appointed to the chair of eloquence in Pavia, and continued to occupy the post, to the delight and benefit of his students, until the professorship was suppressed in all the colleges of Italy. His inaugurative address, *Dell' Origine e dell' Ufficio della Letteratura*, is a masterpiece of beautiful, noble, and patriotic writing. From the time F. lost faith in the sincerity of Bonaparte's intentions to his country, he not only ceased to worship his early idol, but employed the full powers of his wrath and sarcasm in denouncing his treachery. After various vicissitudes, F. finally sought refuge in Britain about 1816, and soon mastered the language sufficiently to contribute to the *Quarterly* and *Edinburgh Reviews*. In London, some of his best writings were published—viz., *Essays on Petrarca and Dante*, *Discorso sul testo del Decamerone*, *Discorso storico sul testo di Dante*, and various minor compositions. He died October 10, 1827, of dropsy, at Turnham Green near London. His works in prose and verse were published in Milan, 1822, by Silvestri.

FOSS, or **FOSSE** (Lat. *fossa*, from *fodio*, I dig), in Fortification, is a ditch or moat, either with or without water, the excavation of which has contributed material for the walls of the fort it is designed to protect. The foss is immediately without the wall, and offers a serious obstacle to escalading the defences.

FO'SSA ET FU'RCA, or **PIT AND GALLOWS**, was an ancient privilege granted by the crown to barons and others, which implied the right of drowning female felons in a ditch, and hanging male felons on a gallows.

FOSSA'NO, a town of Piedmont, in the administrative division of Coni or Cuneo, is situated on the left bank of the Stura, on a hill surmounted by an old castle, 14 miles north-east of Coni. It is surrounded with old walls, and is well built; but the houses are erected over arcades, under which run the footways, and thus the streets have a somewhat gloomy appearance. It has a handsome cathedral, ten churches, a royal college, and numerous minor educational institutions, silk-factories, paper-mills, and tanneries. Pop. 16,423.

FO'SSIL (Lat. *fossilis*, dug out of the earth),

a term formerly applied, in acco
derivation, to whatever was dug
whether mineral or organic, but
the remains of plants and animals imb
earth's crust. They were formerly, and
times still, called petrifactions. They oc
all the stratified rocks, which have, on
been called Fossiliferous strata. It is
impossible to detect them in the
rocks, for the changes that altered the
also affected the organisms, so as either
altogether to obliterate them. In the fu
mica-schist and gneiss they have escaped
ever they existed; and it is only withi
few years that their presence has been d
the gneiss and other rocks, which are th
metamorphosed representatives of the Lo
rian Measures in the north of Scotland.

The conditions in which fossils occur
various. In some Pleistocene beds
remains are but slightly altered, and a
as sub-fossil. In this state are the s

FOTHERGILL PROCESS. This is one of the numerous dry processes in Photography (q. v.) which have for their object the preservation of sensitive plates ready for exposure. It is named after the inventor, and consists in the partial removal of the free nitrate of silver which adheres to the collodion film on withdrawing it from the sensitising bath by washing with water, and the subsequent conversion of the remaining free nitrate of silver into albuminate and chloride of silver by pouring over the plate dilute albumen, containing chloride of ammonium, the excess of albumen being finally washed off by violent agitation with a copious supply of water. The plates being set aside to drain on folds of blotting paper, are, when dry, ready for use. For details of manipulation, see Hardwich's *Photographic Chemistry*.

FOUCHÉ, JOSEPH, Duke of Otranto, the son of a sea-captain, was born at Nantes, 29th May 1763, and educated at the Oratoire. He hailed the Revolution with enthusiasm, and in 1792 became a member of the National Convention. He voted for the death of Louis XVI., and was one of the commissioners of the Committee of Public Safety sent to Lyon in 1794 to reduce that city to obedience. In 1795, he was expelled from the Convention as a dangerous Terrorist, and kept in confinement for a short time. After the revolution of the 18th Brumaire (5th November 1799), in which he took a part, F., as minister of police (an office to which he had been appointed on the 31st July of the same year), organised an extraordinary police. He restrained the new government from deeds of violence, and by his advice the list of *émigrés* was closed, a general amnesty proclaimed, and the principle of moderation and conciliation steadily adhered to. His remark upon the execution of the Duke d'Enghien was very happy: '*C'est bien pis qu'un crime, c'est une faute*' (It is much worse than a crime; it is a *blunder*). In July 1804, he was again placed at the head of the police. His chief endeavours were directed, as before, to attaching the royalists to the imperial throne by prudent moderation. In 1809, the Emperor conferred on him the title of Duke of Otranto, along with large grants from the revenues of the Neapolitan territory. An unguarded expression, however, in a proclamation, lost him the favour of Napoleon, and in the following year he was forced to resign. In the campaign of 1813, the Emperor summoned F. to head-quarters at Dresden, and sent him thence as governor of the Illyrian provinces, and, after the battle of Leipsic, to Rome and Naples, in order to keep a watch upon Murat's proceedings. Being recalled to Paris in the spring of 1814, he predicted the downfall of Napoleon even before his arrival in France. After the Emperor's abdication, F. advised him to abandon Europe altogether. On his return from Elba, Napoleon again nominated him minister of police; but after the battle of Waterloo, F. placed himself at the head of the provisional government, brought about the capitulation of Paris, drew back the army behind the Loire, and thereby prevented unnecessary bloodshed. At the Restoration, Louis XVIII. reappointed him minister of police; but he resigned his office in a few months, and went as ambassador to Dresden. The law of the 12th January 1816, banishing all those who had voted for the death of Louis XVI., was extended to F. also, who from that time resided in different parts of Austria. He died at Trieste, 26th December 1820, leaving an immense fortune. Napoleon, at St Helena, called F. 'a miscreant of all colours;' and Bourrienne declares that he 'never regarded a benefit in any other light than as a means of injuring his benefactor'—statements which are far too exaggerated to be worth much. The simple truth appears to be, that F. was a man whose highest principle was self-interest, but whose sagacity was not less conspicuous, and who never failed to give the governments which he served the soundest political advice. It is true, however, that he was unscrupulous in passing from one party to another, and that he was as destitute of political morality as Napoleon himself. In 1824, appeared a work entitled *Mémoires de Fouché, Duc d'Otrante*, edited by A. Beauchamp, which, though declared to be spurious by the sons of F., is generally held to have been based on genuine documents.

FOUGERES, a handsome town of France, in the department of Ille-et-Vilaine, stands on a hill on the right bank of the Couesnon, 28 miles north-east of Rennes. It is a well-built town, with wide streets, and in the old quarter retains traces of the middle ages in the ancient arcades which still obtrude in some places upon the streets. The castle of F. is picturesque, but being commanded by other parts of the town, forms but a feeble defence. In the neighbourhood is a great forest containing Druidical remains. A famous engagement took place here between the Vendean royalists and the Republicans, November 15, 1793. F. has manufactures of sail-cloth, canvas, tape, flannel, lace, hats, &c.; and dyeworks, principally for the dyeing of scarlet. In the vicinity are important glass and paper works. Pop. (1872) 9850.

FOULA, a solitary isle in the Atlantic, 25 miles west of the Mainland of Shetland. It is 3 by 1½ miles in extent, and consists of five hills (highest, 1300 feet), rising steeply out of the water. The sea-cliffs are sublime, and covered with sea-birds. The isle is seen from Orkney in fine weather, and is supposed to be the Ultima Thule of the ancients. It has only one landing-place. It is inhabited by about 250 fishermen. F. consists of sandstone, with a small patch of granite, gneiss, mica-slate and clay-slate in the north-east corner.

FOULD, Achille, was born in Paris on the 31st of October 1800, and was educated at the Lycée Charlemagne, one of the most celebrated establishments of Paris. He originally belonged to the Jewish creed, his family being wealthy Jew bankers, but he adopted the Protestant faith. Early in life, he was initiated into financial transactions by his father, and his natural talents were developed by travel in Europe and the East. In 1842, he began his political career, being then chosen as a member of the council-general of the Hautes Pyrénées, and immediately after elected a deputy for Tarbes, the chief town of that department. He soon acquired a high position in the Chamber of Deputies for the peculiar talent with which he handled questions of finance and political economy. In 1844, he was appointed reporter to the commission on stamps on newspapers, and his views were adopted, in spite of the opposition party, he being at that period a stanch supporter of M. Guizot's home and foreign policy. After the revolution of 1848, F. accepted the new régime of the republic, and offered his services to the provisional government. In July 1848, he was elected representative for the department of the Seine, and continued to rise in public estimation by the elevated views he expressed in the chamber, while opposing among other things a proposed issue of assignats. During the presidency of Louis Napoleon, F. was four times Minister of Finance, and his repeated resignations for state reasons did not prevent him from being again occasion of the *coup d'état*, 2d D once more resigned his position on following, in consequence of the d the confiscation of the property family. The same day, however, he senator, and shortly afterwards retu minister of state. In this capacity, the Universal Paris Exhibition in pletion of the palace of the Louvre, measures. He remained one of the ministers of Napoleon III. till De ber he was succeeded as minister Walewsky. He was out of o November 1861, at which date finance minister, his long experience ability as a financier pointing to manage the crisis of the Fre time. He died in 1867.

FOULIS, Robert and Andrew, printers of Glasgow, brothers, whose usually classed together.—Robert, the that city, April 20, 1707, was bred, and, Ramsay, for some time practised as those days of flowing periwigs, a respectable profession. Having attende years the lectures of the celebrated Hutcheson, then Professor of Moral Glasgow University, he was advised by man to become a bookseller. In his brother Andrew (born Novemb employed themselves in teaching lang summer, they made short excursions nent, and thereby acquired a conside of learning and knowledge of the seems to have been designed for 1727, he entered as a student at Glasgow, where he is supposed to regular course of study. About Robert began business in Glasgow first publications being chiefly of a In 1742, he published an elegant *Demetrius Phalereus on Elocution*, the first Greek work printed in Gl he was appointed printer to 1744, he brought out his edition of Horace, 12mo, each which was hung up in the college a reward offered for the disco curacy. Soon after, he took his partnership; and for thirty to bring out some of the fin and elegant printing, p and Greek classics, whic either in this country or on them were Cicero's works, 20 vol Commentaries, folio; H 's Herodotus, 9 vols., &c.; Greek Testament; Gray's a folio edition of Milton, in English. the toes, if long, reduced, but no
g or cutting is permissible. The feet must be enveloped in hot bran poultices, and kept off the hard ground by a plentiful supply of short litter. Soap and water clysters, repeated if necessary every hour, usually suffice to open the bowels, which are very irritable, and physic, if required, must therefore be used with extreme caution. Two drachms of aloes is an ample dose in founder. Have the strain taken off the inflamed laminæ by getting the animal, if possible, to lie down, or, where this is impracticable, by slinging him. When the inflammation continues so long that serum and lymph are poured out between the sensitive and horny laminæ, they must have free exit provided, by making an opening through the toe with a small drawing-knife. This may prevent the *pumiced* and disfigured feet that are apt to follow severe and repeated attacks. After the acute symptoms pass, cold applications to the feet, and a mild blister round the coronet, help to restore the parts to their natural condition.

FOUNDING, or **METAL-CASTING**, is the art of obtaining casts of any desired object by means of pouring melted metal into moulds prepared for the purpose. It has risen to great importance in recent times, on account of the many new applications of iron. Iron-founding, brass-founding, type-founding, as well as casting in bronze and zinc, are the principal divisions of the art. The casting of the finer metals and alloys, as gold, silver, and German silver, is necessarily conducted on a smaller scale.

When the casting of an object is required, it is necessary, in the first place, to make a pattern. Suppose it to be a plain round iron pillar, such as is used for hanging a gate upon. A pattern of this is turned in some wood which can be readily made smooth on the surface, such as pine, and then varnished or painted so as to come freely out of the mould. This wooden pillar, or any similar pattern, is always made in at least two pieces, the division being lengthwise, for a reason which we shall presently see. The next step is to prepare the mould. The moulds used by the iron-founder are either of sand or loam, but more generally of fine sand. Proceeding with the preparation of the mould, the founder takes a moulding-box, which is composed of two open iron frames with cross-bars, the one fitting exactly on the other, by means of pins in the upper, dropping into holes in the lower frame. One-half of the box is first filled with damp sand, and the pattern laid upon it, a little dry *parting sand* being sprinkled on the surface. The upper half of the box is then put on, and sand firmly rammed all round the pattern. The box is then carefully opened, and, when the pattern is removed, its impression is left in the sand. The mould at this stage, however, is generally rough and broken. It is necessary, therefore, to give it a better finish, which is done by taking each half of the mould separately, repairing it with a small trowel, and re-introducing the corresponding half of the pattern till the impression is firm and perfect. Finally, the surface of the mould is coated with charcoal-dust, which gives a smooth surface to the future casting. These columns being made hollow, there is yet another matter to arrange before the casting can be made—namely, the *core*. In the instance before us, it would simply be a rod of iron, covered with straw and loam to whatever thickness the internal diameter of the column happened to require. The core of course occupies the centre of the mould.

The cast iron is melted with coke in a round fire-brick furnace, called a *cupola*, the heat being urged by means of a powerful blast, created by fanners revolving at a high speed. The molten metal is run from a tap at the bottom of the furnace into a malleable iron ladle, lined with clay, from which it is poured into the mould through holes called *runners* or *gates*. When the mould is newly filled, numerous jets of blue flame issue from as many small holes pierced in the sand. These perforations are necessary for the escape of air and other gases produced by the action of the hot metal on the mould. Care must also be taken not to have the mould too damp, otherwise steam is generated, which may cause holes in the casting, and even force part of the metal out of the mould. The casting remains covered up for a time, in order to cool slowly, and is then removed by breaking away the sand, and drawing out the core.

In the case of a fluted, or otherwise ornamented pillar, the pattern would require to be in at least four pieces instead of two, because it is only a plain pattern that will come out of the mould in halves without tearing away the sand. When a pattern is necessarily made in several pieces, it is drawn out of the mould bit by bit, to the right or left, as the case may be, and so parts from the sand without breaking it.

Suppose that a small ornamental vase was to surmount the pillar, the founder would prepare the pattern of this in a more elaborate manner. He would first mould it in wax or clay, from which a cast in plaster of Paris is made; from that, again, a cast is taken in an alloy of tin and lead, which, after being sharply chased, and divided into the required number of pieces, is used as a pattern to cast from. All ornamental patterns, such as figures, scrolls, leaves, enriched mouldings, and the like, are made in this way, whatever metal the ultimate casting is to be produced in.

Very large engine cylinders, pans, and such vessels, are cast in loam-moulds, which are built of brick, plastered with loam, then coated with coal-dust, and finally dried by means of a fire. This method is adopted with large plain objects, where a pattern would be expensive, and when few castings of one kind are required.

Iron moulds, coated with blacklead or plumbago, have recently been introduced for casting pipes into; they are greatly more expensive than any other kind, but they enable the founder to dispense with a pattern, as, when once made into the required form, they are not destroyed like moulds of sand or loam at each casting.

Bronze and brass are cast in moulds prepared with finer sand than that used for iron. Pewter and similar soft metallic alloys are cast in brass moulds. The type-founder, on the other hand, uses moulds of steel, which are now worked to a great extent by a machine.

The variety of articles produced by founding or casting are very numerous, among others we may mention cylinders, cisterns, paper-engines, beams, boilers, pumps, and the heavy parts of machinery generally, gates, railings, lamps, grates, fenders, cooking-vessels, and the like, in iron: cannon, many portions of machinery, and numerous ornamental objects, in brass: sculpture and other works of art in bronze and the more costly metals. One of the most remarkable castings yet executed for the requirements of modern engineering, was the cylinder of the hydraulic press used for raising the tubes of the Britannia Bridge. It measured 9 feet × 3 feet 6 inches, the metal being 10 inches thick, and weighed upwards of twenty tons. It remained red hot for three days, and it was seven days more before men could approach it to remove the sand. Sole plates for steam-hammers, and for other purposes, have been cast more than double this weight, but the same care was not required in their execution. In regard to sculpture, perhaps the most wonderful casting known is the colossal statue of Bavaria at
Munich, finished in 1850, which stand
high, the face being equal to the height
It took eight years to cast, and the c
bronze used was about £10,000.

in France is believed to be about 130.
number about 70. Many Protestant states have established foundling hospitals; and those of Moscow and St Petersburg are among the largest in the world.

The Foundling Hospital in London was established by Captain Thomas Coram, a benevolent sailor, in 1739, as 'an hospital for exposed and deserted children.' The ground in Guildford Street was purchased from the Earl of Salisbury for £7000, and the architect of the hospital was Theodore Jacobson. The system of foundling hospitals never having been approved in England, the London hospital was changed in 1760 to what it now is—viz., an hospital for poor illegitimate children whose mothers are known. The committee, previous to admitting the child, must be satisfied of the previous good character and present necessity of the mother. The qualification for a governor is a donation of £50. The great Handel was one of the chief benefactors of the hospital. He endowed it with a magnificent organ, and frequently performed his oratorio of the *Messiah* in the chapel, which is still celebrated for its music. Though every attention is paid to the health and comfort of the children at the Foundling—to such an extent, indeed, as very often to unfit them for the hardships which many of them must encounter in after-life—we have been informed by the physician that they do not attain to the height of average English men and women. There are no foundling hospitals in the United States; but they exist in Mexico, and in almost all the states of South America.

FOUNTAIN, a basin or jet for the supply of fresh running water. There are fountains of every form and variety, from the simple spring with its natural basin, to the most elaborate and ornamental structure for the display or supply of water. In all ages, fountains have been considered as public monuments of the greatest importance; and where the source for their supply has not been provided by nature on the spot, immense labour and expenditure have often been incurred to make up for the deficiency. The splendid Aqueducts (q. v.) of the Romans are instances of the important light in which they regarded the fountains of their cities. Every Roman town had at least one aqueduct, the water from which was distributed to as many fountains as the population required.

Utility is the first object of a fountain, and although they are frequently made subjects of great display and magnificence, the finest fountains are those where the water is the greatest ornament. In the middle ages, fountains of great beauty and variety of form were built, but the useful nature of the structure was never lost sight of. Sometimes a spring was arched over for protection, with a beautiful vault, and a statue of the patron saint placed in a niche, with a basin below to contain the water. In towns where a number of persons might require to draw at one time, a large basin was erected, with a pillar in the centre, from which pipes radiated all round—each with its separate jet to supply the running water—while the basin was used for washing the pitchers. Many examples of this kind of fountain remain. On the following page is represented a fountain at Viterbo, in the Papal States, where there are many of the same description. The pillar is sometimes surmounted by a statue, or has one or more smaller basins, with ornamental streams and jets of water falling from tier to tier. A beautiful fountain of this nature existed in the royal palace at Linlithgow, and a copy of it has been erected in front of Holyrood Palace.

In modern times, the French have distinguished themselves by their magnificent fountains, those of Paris and Versailles being almost unrivalled. In

England, the fountains at Chatsworth (q. v.) and those at the Crystal Palace are among the finest, and are remarkable for the great height to which the water is thrown. Although Rome has lost four-fifths of the aqueducts which so lavishly supplied her with fresh water in the times of the Empire, she is still unsurpassed for the number, beauty, and utility of the public fountains which adorn her streets and places.

Fontana Grande, Viterbo.

Modern fountains are, for the most part, entirely ornamental. This arises from the modern mode of distributing water in pipes through the houses, making the street-fountains to a great extent useless. It is found, however, that our town populations—both man and beast—require some public supplies of water, and these are now largely supplied by the numerous drinking-fountains which are being constructed in all our principal towns.

FOUNTAIN. Water is represented heraldically by a round ball, having wavy stripes of blue and white, barways, called a fountain.

FOUQUÉ, FRIEDRICH HEINRICH KARL, BARON DE LA MOTTE, a modern German author, was grandson of the Prussian general of this name, distinguished in the Seven Years' War. Born at Brandenburg, 12th February 1777, F. served as Prussian officer in the campaigns of 1792 and 1813. The interval between these campaigns was devoted to literary pursuits in the country, and the rest of his life was spent alternately in Paris and on his estate at Nennhausen, and subsequently at Halle. He died in Berlin, 23d January 1843. F. appeared first under the name Pellegrin, as translator of Cervantes's *Numancia*, and author of some effusions in the spirit of Spanish poetry. But the Norse legends and old German poetry attracted him most strongly; this was evinced in numerous romances, in prose and verse, which picture the old life of medieval Europe. Among the best known of these are *Sigurd, der Schlangentödter* (1809)—the first work to which F. attached his real name—*Der Zauberring*, *Die Fahrten Thiodolfs*, and *Undine*. Successful in exhibiting many of the beauties of the romantic school, he is yet chargeable with all its extravagances. Straining too often after fantastically unnatural conceits, he seems fascinated by the antique life which he pictures, rather merely from its quaint contrast with modern manners, than as a form into which the life of actually living men had shaped itself in former
times. He himself edited a selection of

. He was unwearied in his efforts to
men of power or capital, who could give
ries the test of practical realisation, and for
the last years of his life waited patiently at
hour every day, expecting to be visited by
patron. His less patient disciples probably hastened his death by immature and partial efforts at realisation. He died in Paris, October 8, 1837.

FOURIERISM, the Social System invented by Charles Fourier, is contained in his published works, in a large collection of unpublished MSS., and in the writings of Considerant, Lechevallier, Brisbane, and others of his disciples. It differs materially from the systems of Communism strictly so called, and all other social theories, and professes to be based upon natural laws, and capable of being carried out on mathematical principles, as fixed and certain as those of geometry, music, or colours. The earth and human society, Fourier taught, are in their crude and infantile stage. The period of the race will be 80,000 years, the latter portion of which will be its declining phase, as the present is its ascending. The middle term will be a long period of maturity, prosperity, and happiness. What we call civilisation, Fourier considers a false and imperfect condition, with poverty, crime, ignorance, idleness, repugnant toil, disease, wasting wars, general antagonism, oppression, and misery. He believed that Association would produce general riches, honesty, attractive and varied industry, health, peace, and universal happiness. Considering attractions and repulsions the governing forces of all nature, and that God has distributed them for the happiness of all His creatures, he held that 'attractions are proportional to destinies,' or that the desires or passions of men, their aptitudes and inclinations, if they could have free scope, would infallibly produce the highest condition and greatest happiness of which they are capable. He believed in a universal harmony, flowing from and centering in God, the author of all harmonies, and that there is therefore a principle of 'universal analogy.' Seeing that all things, from suns and planets to atoms, range themselves in groups and series, according to certain fixed laws of attraction and repulsion, he laboured to discover the kind of human society that must eventually form itself in obedience to these laws. This is the Association or Phalanstery, which is to consist of 400 families or 1800 persons, which number he found included the whole circle of human capacities. These should live in one immense edifice, in the centre of a large and highly cultivated domain, and furnished with workshops, studios, and all the appliances of industry and art, as well as all the sources of amusement and pleasure. When the earth is covered with palaces of attractive industry, the associations will also unite in groups and series, under a unitary government. There will be but one language and one government, and the only armies will be the great industrial armies, which will drain swamps, irrigate deserts, plant forests, and effect the amelioration of climates. The system of Fourier does not propose to destroy, but rather to conserve property, position, and hereditary rights, nor does it war directly with morals or religion. The property of the Association is to be held in shares, and the whole product of the industrial and artistic groups is to be divided into twelve parts, of which five parts are due to labour, four to capital, and three to talent. The apartments are to be of various prices, and the styles of living to vary in luxury and cost; but the poorest person in the Association is not only to be secure of comfort, but his minimum of enjoyments will be greater than the present social arrangements can give to princes and millionaires; while these will have opened to them pleasures of which they can now scarcely have a conception. The economies of the large scale in the Phalanstery reduce by two-thirds the expenses of living, while an attractive and scientific industry would quadruple the products of civilisation.

The passions of the human soul to which the system of Fourier would give full scope, he described as the five sensitive—sight, hearing, taste, smell, touch; four affective—friendship, love, ambition, and paternity; three distributive—the emulative, alternating, and composite. In these he found the springs of industry and true society. Emulation, the desire of success, honours, rewards, is the great stimulant to exertion; alternation of employments makes work a recreation; and the composite passion requires combinations of charm and enjoyment which only Association can give. Many attempts have been made—a few in France, and more in America—to carry the ideas of Fourier into practical realisation; but they have all been on a small scale, and with inadequate means, and have resulted in failure. Whatever we may think of the system, in its principles or its theoretical development, nothing can be founded upon the failure of such experiments. It remains to be proved whether human nature, in its present state, is capable of carrying out successfully a social system so widely varying from all existing social conditions. The moral objections to Fourierism are, that it appears to make luxury, ambition, and sensual delights the end of existence—the incentives and rewards to all exertions; and that the passions of men, when left in the perfect freedom which this system requires, would lead to ruinous demoralisations. The answer is, that 'attractions are proportional to destinies,' and that these excesses belong to the present state, and are incident to the poverty and repressions of civilisation, but could not exist in a true society; which raises the question—What is a true society? Whatever may be thought of the practicability of the system, its study in the works of Fourier is full of suggestions to the student in sociology.

FOURNI ISLANDS (anc. *Corissiæ* or *Córseæ*), a group of about 20 small islands in the Grecian Archipelago, between Nicaria and Samos, on the eastern coast of Asiatic Turkey. The largest of these islets is about five miles in circuit.

FOWEY, or **FOY**, a borough town on the south coast of Cornwall, on the right bank of the river Fowey, 25 miles south-south-west of Launceston. It is sheltered by hills, and lies amid picturesque scenery, rude sea-cliffs, and promontories. The harbour admits large vessels at all states of the tide, and its entrance is guarded by three forts. The chief business is catching and curing pilchards, which, with 'china-stone' and iron-ore, form the main exports. F. sent 47 ships and 770 men to the siege of Calais by Edward III. in 1347. It was burned by the French in 1457, and taken by Fairfax in 1646. Pop. (1871) 1394.

FOWL (Ger. *vogel*; allied to the Lat. root *fug-*, to flee, and perhaps to *avi-*), a word originally synonymous with *bird*, and still employed in that signification, but also in a much more restricted sense, as the designation of the genus of Birds (*Gallus*) to which the common Domestic Fowl (*G. domesticus*) belongs. This genus gives its name to the important order of *Gallinaceous Birds*, also called, from their well known habit of scraping the earth in search of food, *Rasores* (Lat. Scrapers); and is included in the family *Phasianidæ*, with pheasants, tragopans, &c. The general form, and the characters of the bill, feet, &c., agree with those of the pheasants; but the crown of the head is generally naked, and furnished with a fleshy *comb*, the base of the lower mandibles also bearing fleshy lobes or *wattles*, characters which are most conspicuous in the males; and the tail is very different from that of the pheasants, and, indeed, very singularly formed, being composed of fourteen feathers in two nearly vertical planes, or as if a horizontal tail we together, so as to make a sharp a two middle feathers being the upper males elongated beyond the rest, and arched. The tail-coverts of the male are ample, and the feathers of the back of the of the neck are either elongated and loosely forming the *hackles*, so much valued by a dressing artificial flies, or are otherwise serve the purpose of adornment; chara are also sometimes exhibited in a ver degree in the female sex. The legs of the armed with spurs, as in the pheasants, much use is made in the combats of th among themselves, all of them being ver cious. They are all polygamous, and u endure the presence of a rival. They are a of the East Indies and of the Malayan Arc From what country, and at what period the Fowl was originally introduced into E uncertain. The remains of Egyptian carry us back to a period when it was unknown in Egypt, and there is no distn to it in the Old Testament; but it seem been common in the south of Europe earliest ages of European civilisation. The sacred to Apollo, to Mercury, to Mars, Æsculapius. It was figured on Grecian an coins and gems; it was highly valued fo and pugnacity, and the sport of cock-figl favourite one both with the Greeks and as it is amongst the Chinese, the Malay other nations at the present day, and times was amongst all classes of societ Britain. See COCK-FIGHTING. The D appears to have been known to the an before the Roman invasion; and when Sea Islands were first visited by Europea found there in the same domesticated there also cock-fighting was found to be able amusement of the savage natives. country of the Domestic Fowl is not certai nor is it certain what the species is in state. The ancient Greeks sometimes calle *Persian Bird*, and hence it has been suppos a native of Persia; but there is nothing els port this opinion, and it seems likely enou this appellation may at most only indicate duction into Greece from Persia. The Jungl of India, the first species of *Gallus* known wild state to naturalists, was for some tim to be the origin of the Domestic Fowl, b opinion there are strong objections in peculiar character of some of the feath distinguish the Jungle Fowl, and of whic ever appears in the Domestic Fowl. More the Bankiva Fowl and other species discovered in Java and other islands of Archipelago, more nearly resembling Fowl, and the distribution of the the islands of the Pacific Ocean is the belief that it derived its origin fr region; but still the identification of the remains difficult, and some naturalists incl opinion that the Domestic Fowl may be from intermixture of distinct wild races.

The BANKIVA FOWL (*G. Bankiva*), native of is extremely similar to some of the varieties; indeed, Sir William Jardine say Bantams so nearly resemble this bird, would be great difficulty in making a The comb is large and lobed, or dente colours are brilliant, steel-blue and ches and yellowish brown, the hackles abo golden orange; some parts of the plumag ing a very fine play of colours. A very

, or a variety of the same, but rather larger,
ed in some parts of continental India.' Very
r also is the BRONZED FOWL (*G. æneus*), found
matra, a bird resplendent in metallic green,
, and lake; but of which the comb has the
margin unbroken; the wattles are combined
one attached to the centre of the throat;
he neck feathers do not assume the *hackle*
ter, which appears in the neighbourhood of
il alone. These peculiarities also belong to
ORK-TAILED FOWL (*G. furcatus* or *Javanicus*),
ies very abundant in the jungles of Java, and
to be seen on their outskirts, nearly two feet
gth from the tip of the bill to the extremity
tail. A still larger species (if, indeed, these
ot rather varieties than species) is the
TIC FOWL, JAGO FOWL, or KULM FOWL (*G.*
rus) of Sumatra, with double wattle under
roat, abundant hackles on the head, neck, and
part of the back, green and reddish yellow
incipal colours, and the height considerably
than two feet. The JUNGLE FOWL (*G. Son-*
), abundant in the higher wooded districts of
where it is much sought after by European
men, is about equal in size to an ordinary
tic Fowl, but is more slender and graceful in
m; the comb of the male is large, and its
broken; the colours are rich and beautiful;
remarkable peculiarity is exhibited in the
feathers, which are terminated by flat horny
of a golden orange colour, into which the
expands, or the shaft thickening and termi-
abruptly gives rise to a battledore like stem
ae, in substance like the tips of some of the
s of the wax-wing.

Domestic Fowl there are some very curious
, of which some naturalists have attempted
situte distinct species, particularly the NEGRO
(*G. morio*), rarely seen in British poultry-
remarkable for the black colour of the *perios-*
outer covering of the bones), and the dull
the comb, wattles, and skin; the SILKY
(*G. lanatus*), very common in China and
with periosteum and skin of the same dark
as the Negro Fowl, but the flesh remarkably
the comb and wattles purple, the feathers
rebs disunited and silky; and the FRIESLAND
a mistake for FRIZZLED FOWL (*G. crispus*),
all the feathers standing nearly at right
the body.

are also varieties of the Domestic Fowl
ble for what may be considered monstro-

. The GAME FOWL, with erect and slender
and shewy colours, valued also for the delicacy
flesh and of the eggs, although the eggs are
small. It is this breed which is used for
ting; and so excessive is the pugnacity
racterises it, that broods scarcely feathered
sionally found to have reduced themselves
blindness by their combats. Some poultry-
s think it good to have a game cock in their
y-yard, on account of the improvement of the
of the fowls sent to the table; but it is
eedless to say, he must, like the prototype
son Crusoe, be sole monarch of all he
. 2. The DORKING FOWL, so named from
in Surrey where it has long been bred
numbers for the London market a breed
terised by an additional spur on each leg; often of a white colour, with short legs; one of the most useful of all breeds, both for excellence of flesh and for abundance of eggs. 3. The POLISH FOWL, black, with a white tuft, a breed very extensively reared in France, Egypt, &c., little inclined to incubation, but valued for an almost uninterrupted laying of eggs. 4. The SPANISH FOWL, very similar to the Polish, but larger, and laying larger eggs, on account of which it is now much valued, and very common in Britain; black, with white cheeks and large red comb. 5. The MALAY FOWL, tall and handsome, very pugnacious, but little esteemed. 6. The HAMBURG, of very beautiful plumage, and much valued for the quality both of flesh and eggs, as also for extreme productiveness of eggs. 7. The COCHIN CHINA FOWL, a large, tall, ungraceful variety, with small tail and wings, for which there was a great rage among poultry-fanciers when it was newly introduced into Britain, and particularly about the year 1852, and which is valuable chiefly on account of its fecundity, eggs being laid even during winter, and the hens incubating frequently. 8. The BANTAM FOWL (q. v.), a diminutive variety, rather curious than useful.—Of most of these there are many sub-varieties and *fancy breeds*—gold-pencilled, silver-pencilled, &c. The common DUNGHILL FOWL is apparently a breed produced by the intermixture of others, and perhaps chiefly a less graceful, less spirited, and less pugnacious race of the Game Fowl.

Concerning the treatment of the Domestic Fowl in the poultry-yard, the diseases to which it is liable, &c., see POULTRY. The artificial hatching of eggs is noticed in the article INCUBATION. Concerning the eggs of the Domestic Fowl as an article of commerce, &c., see EGG.

The readiness with which the Domestic Fowl can be induced to go on laying eggs far beyond the number proper for a brood, is not nearly equalled in the case of any other domesticated bird, and greatly enhances the usefulness of this species to mankind, whether the eggs are used for food, or, by artificial hatching, made to produce chickens, as is common in Egypt and some other countries. Few hens incubate oftener than once a year, but some lay in the course of a year even more than 200 eggs.

FOWLER'S SOLUTION. See ARSENIC.

FOWLING—the killing or taking of birds for the sake of their flesh, feathers, &c.—is very variously practised in different parts of the world. In some places, it is one of the principal employments of the people, who greatly depend on it for their subsistence, and prosecute it with the greatest toil and danger; elsewhere, it is in some of its forms a recreation, for the sake of which much expense is incurred by the opulent. The modes in which it is practised depend partly on the habits of different kinds of birds, and partly on the progress of civilisation and the arts. The peculiar habits of some birds render it very easy to take or kill them. Nets are much used in the capture of many kinds of birds, particularly of small birds intended for the table; bird-lime is employed for the same purpose, and birds are taken by means of it in greatest numbers near their drinking-places, particularly in hot and dry weather; gins, springes, and traps of various kinds are also employed.

The numerous kinds of ducks, geese, and other *Anatidæ*, are, in an economical point of view, among the most important of birds; and the methods employed for their capture are very various and interesting. These, however, we reserve for a separate article, WILDFOWL; and refraining also here from any notice of the amusements of the sportsman, we shall proceed to describe the methods adopted in *Rock-fowling*, on which the inhabitants of many northern coasts and islands in a great measure depend for their means of subsistence. Of all kinds of fowling, it is by far the most adventurous. The objects of pursuit are gannets or solan geese, gulls, terns, guillemots, and other sea-birds, which frequent the most lofty precipices, and breed on their shelves and ledges. The flesh, even of the best of them, is generally coarse, and of a fishy taste, yet it forms great part of the food of the poor people, both fresh, and salted for winter provisions. The flesh of the young is more tender and pleasant than that of adult birds. The eggs of some species are sought after by the same perilous means as the birds themselves. The feathers, too, are an article of commerce. The people of St Kilda pay part of their rent in feathers; and the rocks of that island are apportioned among its inhabitants as exactly as its soil. Almost every man in the island is a cragsman or rock-fowler, which is pretty nearly the case also in many other northern isles. The multitudes of sea-fowl around many of the rocky northern coasts is prodigious, resembling at a distance—as may be seen at the Bass Rock in the Firth of Forth—the bees around a busy hive. Uninhabited islets are annually visited by fowlers, as Borrera by the people of St Kilda; and the 'stacks,' or high insular rocks near the shore, are often extremely productive. These are, of course, reached by means of a boat; and whilst landing is often both difficult and dangerous, the climbing of the precipice is still more so. The Norwegian fowlers, or 'bird-men,' carry on such expeditions with a *bird-pole* or *fowling-staff*, about five or six yards long, and a rope of several fathoms. The bird-pole has an iron hook at one end: it has also a flat head; and by means of it the fowler is pushed and guided by his comrades below as he ascends a very steep or precipitous cliff; by means of it, also, he strikes down or draws in birds. The rope is used to fasten two fowlers together, being attached to the waist of each: they aid one another in climbing, pushing, and drawing one another up the rocks, the safety of the one often depending on the strength and courage of the other. The bird-pole is also used with a small net attached to it, in the capture of birds that are flying around. The Norwegian fowlers sometimes remain for days on ledges where birds are abundant, sleeping in holes or clefts, and having food let down to them by a rope from above.

Still more perilous, if possible, is the mode of fowling practised where the precipices cannot be scaled. The fowler is let down by a rope, and hangs in mid-air, often at an elevation of several hundred feet, above rough rocks or roaring waves; and by means of his feet or of a pole, throws himself out to such a distance from the face of the rock as to obtain a view of all its ledges and crannies, to which, with astonishing coolness and dexterity, he directs his course, often also catching the birds that fly near him in the air. Speaking of the fowlers of St Kilda, Wilson (*Voyage Round the Coasts of Scotland and the Isles*) remarks: 'How one man (for such is the case), himself standing with the points of his toes upon the verge of a precipice many hundred feet deep, can, with such secure and unerring strength, sustain the entire weight of another man bounding from point to point below him with irregular and frequent [illegible], is what a stranger cannot understand. . . . But we ascertained that there is never more than a single man above supporting the weight of the one below. Each of these couples has two ropes. The rope which the upper man holds in his hands is fastened round the body the arms of him who descends, while is pressed by the feet of the upper held in the hand of the lower.' The is for giving signals, and for sending up captured. The principal rope is made hide, cut into thongs and twisted; it is as to last for two generations, and is as valuable property by father to materials, however, are used elsewhere practice differs also as to the number holding the rope above. In the Faroe some of the precipices are 1400 feet in rope is usually held by a number some of the Scottish islands, fowlers adventurous enough to descend the cli fastening the rope for themselves to a into the ground above. The fowlers Isles sometimes use the pole with net whilst suspended in the air. It is not the fowler, when he finds a ledge or precipice abounding in birds, to diseng from the rope whilst he pursues his lab but when the precipice overhangs a exposed to a great danger of the rope from his reach. A case is on record i only resource of the fowler was to make spring and catch the rope, which hung before him in the air; and this he doing.

The cut represents rock-fowling at Noss, a precipitous insular rock, separate

The Holm of Noss, Shetland.

one of the Shetland Isles, by a chasm wide, and 160 feet deep, over which ropes stretched, so that a *cradle* or sparred made to pass along them, affording a grassy summit of the Holm, where a few feed, and where innumerable sea-bi nests.

FOWLS OF WARREN. Lord Coke are 'the partridge, quail, rail, &c.' 'phea cock, &c.,' and the 'mallard, heron, &c. etceteras without explanation (*Co. L* wood, again, lays it down that the fowls of warren, the pheasant and (Manw. 95). In the Duke of Devon (7 B. and C. 36), it was decided that birds of warren.

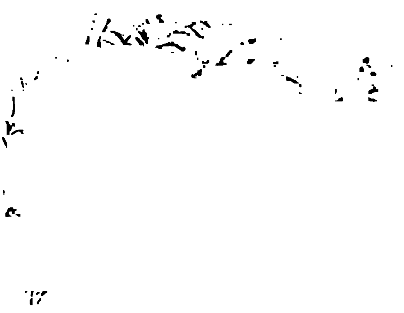
FOX, Charles James, a celebrated Whig statesman, was the second son of Henry Fox, first Lord Holland, by Lady Georgiana Carolina, eldest daughter of the Duke of Richmond. He was born, according to Lord John Russell's memoir, on the 24th January 1749 (N.S.), and was educated at Eton and Oxford, spending his vacations on the continent in the gayest and wittiest circles of the French capital, and visiting Switzerland and Italy. Notwithstanding the irregular life which he led even as a school-boy, he was very distinguished for ability both at school and college; and so high was his father's opinion of his talents, that at the age of nineteen he had him brought into parliament as member for the borough of Midhurst, a step to which he is said to have been further incited by the fact, that, even at this early age, F.'s energies had found an outlet in gambling and various other forms of dissipation. His precocity in vice, as well as in intellectual development, is said to have been the result of the injudicious fondness of his very unprincipled but very gifted father. Till he ed his majority, F. prudently kept silent in the —, but immediately thereafter he appeared as a orter of the administration of Lord North, and rewarded with the office of one of the lords of Admiralty. In 1772, he resigned that office, and following year was named a commissioner of asury. From that post he was dismissed, in quence of a quarrel with Lord North, and over to the ranks of the opposition. During whole course of the American war, he was the formidable opponent of the coercive measures h were adopted by the government, and the powerful advocate of the claims of the colo- acting, to this extent at least, in accordance the views which for many years before had ressed upon the country by the great Lord the father of his future rival Mr Pitt. rence between them was, that whereas Chatham urged conciliation, in order to pre- connection between the two countries, F. and foretold the necessity and the advan- lete separation. In 1782, on the down- North, F. was appointed one of the of state, which office he held till the Marquis of Rockingham, when he was y the Earl of Shelburne, afterwards of Lansdowne. On the dissolution of the administration, the North and Fox coali ormed, and F. resumed his former office; rejection of his India Bill by the House of oon after led to the resignation of his govern- It was now that Mr Pitt came into power, the long and famous contest between him who occupied the position of leader of opposition, commenced. In 1788, he enjoyed a rt respite from his public labours. Accompanied his wife, he visited the continent, and having at a few days at Lausanne, in the company of bon, who was there engaged in writing his us history, he set out for Italy. The sudden of the king, however, and the necessity of tuting a regency, rendered it undesirable that ould be longer absent from England, and he ed back to his post. The regency, the trial rren Hastings, the French Revolution, and the which followed it, gave ample scope to the s and energies of F., and on all occasions he yed his influence to modify, if not to coun- , the policy of his great rival. He was a ous opponent of the war with France, and advocate of those non-intervention views which greater favour in our day than they did in his. r the death of Pitt, F. was recalled to office, endeavoured to realise his doctrines by setting on foot negotiations for a peace with France, the results of which he did not live to witness. He died on the 13th September 1806, in his 59th year. In private life, Mr F. was a genial companion, kindly and sincere in the closer relations of friendship, whilst his conduct to those to whom he was opposed in public was generous, and free from every trace of malignity or enmity. Lord John Russell, in the preface to his *Memorials and Correspondence*, speaks of the singular candour, boldness, simplicity, and kindness of his character; and of his oratorical powers it is enough to record, that Burke called him 'the greatest debater the world ever saw,' and Sir James Mackintosh, 'the most Demosthenian speaker since Demosthenes.' His remains were interred in Westminster Abbey, so near to those of Pitt, as to suggest to Sir Walter Scott the well-known couplet—

> Shed upon Fox's grave the tear,
> 'Twill trickle to his rival's bier.

FOX, George, the originator of the Society of Friends (q. v.), commonly called Quakers, was born at Drayton, in Leicestershire, in 1624, and at an early age was employed in keeping sheep. Subsequently, he was apprenticed to a country shoemaker; but when about 19 years of age, his religious impressions produced such a strong conviction in him, that he believed himself to be the subject of a special Divine call; and abandoning his usual avocations, wandered solitarily through the country, dressed merely in a leathern doublet of his own making, and absorbed in spiritual reveries. After some time, his friends induced him to return home, but F. stayed with them only for a short period, and finally adopted the career of an itinerant religious reformer. About 1646, he left off attending church for divine worship, but did not scruple to interrupt the services when conducted by 'professors,' i. e. formalists, or persons whom he believed not to be genuine Christians. His first efforts at proselytism were made at Manchester in 1648. The excitement caused was very great, and, in consequence, F. was imprisoned for some time as a disturber of the peace. It may be proper to mention here, that his leading doctrines or convictions were the futility of learning for the work of the ministry, the presence of Christ in the heart as the 'inner light,' superseding all other lights, and the necessity of trying men's opinions and religions by the Holy Spirit, and not by the Scriptures. F. next travelled through various of the midland counties, Derby, Leicester, and Northampton, exhorting the people in public places to forsake all vicious practices, drunkenness, swearing, &c., and to cultivate the Christian graces. He had a winning manner, resulting from his extreme earnestness and simplicity of purpose, and made many converts. His followers were first contemptuously called 'Quakers' at Derby, in 1650, by Justice Bennet, for what reason is not exactly known, but it may be conjectured that it possibly arose from the agitation exhibited in their speech when they believed themselves 'moved by the Holy Ghost.' In 1655, F. was brought to London, and examined before Cromwell, who quickly saw that there was nothing in Quakerism to excite his apprehensions, and pronounced the doctrines and the character of its founder to be irreproachable. Nevertheless, for some years after this, F. had a hard struggle with his Puritan antagonists. In an age of dogmatism and fanaticism, it was not to be expected that the half-mystical spiritualities and grotesque practical crotchets of the Leicestershire shoemaker could meet with any official toleration. F. was constantly vilified and frequently imprisoned by country magistrates. In 1669, he married the widow of Judge Fell. He then went to America, where he spent two years in propagating his views with much success. On his return to England in 1673, he was imprisoned for some time in Worcester jail, under the charge of having 'held a meeting from all parts of the nation for terrifying the king's subjects.' On his release, he visited Holland, and afterwards Hamburg, Holstein, and Danzig, always endeavouring to persuade men to listen to the voice of Christ within them. He died in London, January 13, 1691. F. was not a man of broad and philosophic genius; he did not enrich the world with the multitude of his thoughts; in fact, there is a conspicuous poverty of intellect and sentiment manifested in his writings, but (as often happens in the case of a mystic) the earnestness and clearness with which, in the opinion of many, one great truth of Christianity was realised, imparted a power and efficacy to his words that genius itself might envy. His doctrine of the universal 'inner light'—defended in a more learned fashion by Barclay (q. v.) in his *Apology for the Quakers*—may be regarded as a protest against the narrow or at least excessive 'scripturalism' of his age, but his understanding was not sufficiently clear and strong to guide him safely in all the consequences which he ventured to deduce from it. Hence have sprung most of the *niaiseries* of Quakerism. His writings were collected and published in 3 vols., 1694—1706. An edition in 8 vols. has been published at Philadelphia, United States.—Compare Sewel's *History of the Quakers*; Neal's *Puritans*; Marsh's *Life of Fox* (1848); and Janney's *Life of Fox, with Dissertations*, &c. (Phila. 1853).

FOX, William Johnson, orator and political writer, the son of a small Suffolk farmer, who afterwards settled as a weaver at Norwich, was born in 1786. He gave early promise of talent, and was sent to Homerton College, to be trained for the ministry of the Independents. He subsequently seceded to Unitarianism, but ultimately shaking off all allegiance to existing Christian churches, he delivered a series of prelections at his chapel in South Place, Finsbury, which marked him out as the leader and organ of English rationalism. When the Anti-corn-law League enlisted the ablest platform orators of the day in the service of free trade, his bold and impassioned rhetoric greatly contributed to arouse and intensify public feeling. M. Guizot quotes his speeches as the most finished examples of oratory which the great conflict produced. Their effect upon the vast metropolitan audiences to which they were addressed was electric. F. also contributed by his pen to the success of free trade, and his *Letters of a Norwich Weaver Boy* were largely quoted and read. After the abolition of the Corn Laws, he was invited to stand for Oldham, which borough he continued to represent till 1863 since 1847. Like most men who enter the House of Commons late in life, F. did not altogether realise the oratorical promise of his platform and pulpit career. His best parliamentary speeches were upon the education of the people. As a politician he was ever a consistent member of the advanced Liberal party. A succession of illnesses in his late years interfered with his attendance in parliament. He was among the earliest contributors to the *Westminster Review*, edited for many years the *Monthly Repository*, and largely contributed to various other organs of public opinion. His *Lectures, chiefly addressed to the Working-Classes*, were published in 3 vols. He is the author of a philosophical dissertation on *Religious Ideas*, and other theological works. He died in 1864.

FOX (*Vulpes*), a genus of *Canidæ* (q. v.), particularly distinguished from dogs, wolv by the pupils of the eyes contracting in the form of the section of a lens, This takes place whenever the eyes are a strong light, and foxes are all noctu Foxes are also generally of lower st portion to their length than the other C have a roundish head, with a very pointe short triangular ears, slender limbs, and tail. They dig burrows for themselves in or take possession of holes already exist are famous for their cunning, which the both in their artifices for obtaining prey escaping from danger. They feed on smal peds, birds, eggs, &c.; some of them, how partly on fruits and other vegetable sub The Common Fox (*V. vulgaris*), a native parts of Europe, is the only British speci still pretty abundant in most parts of th although from many parts it would prob been extirpated ere now, unless it had be measure protected with a view to the spo hunting. The common fox is reddish bro white beneath; the outside of the ears black line extending from the inner angle to the mouth; the legs mostly black, the tail generally white, although specimens occur in which it is gray, or even black. at least three varieties known in Britain, marked by difference of size and form— *hound Fox* being more slender and lo and the *Cur Fox*—frequent in upla districts—being smaller than the commo



The Common Fox (*Vulpes vulgaris*).

Other varieties occur in the north of fox has a gland under the tail, which fetid substance, communicating to its well-known smell. It breeds having usually four, five, or six y litter. Its usual voice is a kind of of sight, hearing, and smelling Innumerable anecdotes are on reco its cunning. The difficulty of setting they shall not be detected and avoided by known. Foxes are said to have been approaching water-fowl by swimming a turf in the mouth, so as to remai A most trustworthy person assured this article, that he saw a fox approa hares that were feeding in a field, with limping motion, and having his head eating clover, till he was near enough, by a rush, to secure very different food. Foxes in hen-roosts have often been known death, and to submit to being dr very roughly treated without a an opportunity of escape presente driven to their holes, and these are …ed with traps, they not unfrequently shew just appreciation of the danger, that they dure starvation for days and even weeks than come out. Even when taken young, nmon fox can hardly be tamed; and very tances are on record of its shewing even s of that attachment to man of which y animals are capable, and for which the so remarkable. The improbability of any d stic races of dog being at all derived ox, is noticed in the article DOG. …h renard appears in English in reynard, r appellation of the fox. The south of produces foxes of smaller size than the n fox, having the fur of the belly black, d by some as a mere variety, by others as a species (V. melanogaster). They are less rous, and to them some of the allusions and elate as of the fox and grapes, &c. which accord well with the habits of the foxes of and of Northern Europe. The Himalaya produce a species of fox (V. Himalaicus) ar to the common fox, but of superior brilliancy of colours. The fur is rich and The BLACK FOX of Northern Asia is also very to the common fox, but is entirely of a black colour, except the tip of the tail, s white; its fur is greatly esteemed, brings a rice, and forms an article of export from hatka to China. The COAL FOX (V. alopex) parts of Europe, as Switzerland and Bavaria, me naturalists regarded as distinct from the n fox. It is of inferior size, more timid, and oublesome; the tip of the tail is black.

America has several species of fox, of which D FOX (V. fulvus) very nearly resembles the n fox of Europe, but is of rather larger size, horter muzzle, eyes nearer each other, and a opiously bushy tail. Its fur is also longer, more brilliantly coloured, and much more e, forming a considerable article of export fur countries; in which, as well as in and in the northern parts of the United species is abundant. The CROSS FOX is it, distinguished by a longitudinal dark the back, crossed by a transverse band ulders. The burrow of this fox 'at first nwards for four or five feet at an angle of twenty-five degrees, it then inclines a little, which is a security against inundand is continued at a depth of about three or t from the surface, until it reaches a point it is divided into two or three galleries.' umbers of these foxes are annually tracked burrows, and digged or smoked out of them erican farmers. The GRAY FOX (V. Virgins the most abundant species of the southern extending, however, as far north as Canada, t is rare. It is of a gray colour, varied with s about the size of the common fox, but not so d sometimes eats vegetable substances, such of maize. The gray fox exhibits not a little cunning for which the common fox is cele and when pursued by hunters and hounds, n known to escape by getting upon the rail ce and running along it for some distance, so e scent was lost. This was on one occasion n the newly laid rail of a railroad elevated s swamp. It is not unfrequent for the gray en hard pressed, to take refuge in a tree, larly if one which has somewhat fallen from pendicular presents itself. There are a numother species of fox, Asiatic, African, and an; but the most deserving of notice is the FOX (V. lagopus), which inhabits the most northern parts of Europe, Asia, and America. It is very plentiful in Iceland, feeding much on ptarmigans, and sometimes on young lambs. Great numbers are found on the shores of Hudson's Bay, particularly during winter, and they have been supposed to migrate thither from still more northern regions; but it has been ascertained that this animal spends the winter even in the most northern regions that have ever been visited by man, braving the cold of Melville Island and Banks's Land, and finding abundance of food in the hares, marmots, ptarmigans, and other animals which also remain there. The Arctic Fox is rather smaller than the common fox; it is more densely clothed with a woolly fur, which on some parts is two inches in length; the tail is extremely bushy; and even the soles of the feet are thickly covered with hair. The colour is pure white in winter, at least in very cold climates; varying to a brownish or bluish colour in summer. It is gregarious, and many burrows are often found together. It is extremely cleanly in its habits, and is quite devoid of the offensive smell which belongs to most of the foxes; it is also much less cunning, and much more easily trapped, as well as much more gentle and capable of being tamed. Its flesh has been sometimes eaten by arctic voyagers, with a relish due to the extreme cold of the climate, and the consequent demand of the system for animal food. Its fur is not nearly equal in value to that of the red fox.

FOXE, JOHN, the martyrologist, was born of respectable parents in 1517, at Boston, Lincolnshire. In 1533, he entered as a student at Brasenose College, Oxford; in 1538, he took his Bachelor's, and in 1543, his Master's degree, and was elected a fellow of Magdalen College. He displayed at an early period an inclination for Latin poetry, and wrote several plays in that language upon scriptural subjects. Of these, the only one that remains, entitled *De Christo Triumphante*, was printed at London in 1551, and at Basel in 1556, 8vo, and 1672. The religious movements of the times led him to study the great controversy between Popery and Protestantism, and becoming a convert to the principles of the Reformation, he was, July 22, 1545, expelled from his college for heresy. His father being dead, and his mother married again, his stepfather refused him any further aid, and he was, in consequence, reduced to great distress. For a short time, he was employed as tutor to the children of Sir Thomas Lucy of Charlecote, Warwickshire, and afterwards was engaged by the Duchess of Richmond as tutor to the children of her brother, the Earl of Surrey, then a state prisoner in the Tower. In this capacity he remained during the whole reign of Edward VI., but was never, notwithstanding Anthony Wood's assertion to the contrary, restored to his fellowship at Magdalen. On June 23, 1550, he was ordained deacon by Ridley, Bishop of London, and preached the doctrines of the Reformation at Reigate. During the reign of Mary, he retired to the continent. On the accession of Queen Elizabeth, he returned to England in October 1559; and in May 1563, he was inducted into the canonry and prebend of Shipton, in the cathedral of Salisbury. He also enjoyed the living of Cripplegate, which he soon resigned, and for a year he held a stall at Durham. In 1575, when some Dutch Anabaptists were condemned to the flames in London, F. interceded for them with Queen Elizabeth and other persons in authority, but without effect. He wrote numerous controversial and other works, but the one that has immortalised his name is his *History of the Acts and Monuments of the Church*, popularly known as *Foxe's Book of Martyrs*, the first part of which was published at Strasburg in 1554. The first English edition appeared in 1563, in one vol. folio. Sanctioned by the bishops, it was ordered, by a canon of the Anglican Convocation, to be placed in the hall of every episcopal palace in England, and has gone through innumerable editions. It is not a very critical work, as might naturally be supposed, and Roman Catholics deny its trustworthiness. F. died in 1587, in his 70th year, and was buried in the chancel of St Giles's, Cripplegate, London.

FOXES AND FOX-HUNTING. The law with reference to fox-hunting, which is a matter of a good deal of importance in many parts of the country, seems to stand thus in England: 'Though in general all persons who go upon another's lands without permission are trespassers in the eye of the law, yet there are some cases where the trespass is said to be justifiable,' says Mr Paterson, the most recent writer on the subject, and he quotes Blackstone's dictum to the effect that 'the common law warrants the hunting of ravenous beasts of prey, as badgers and foxes, in another man's land, because the destroying such creatures is said to be profitable to the public' (3 Black. *Com.* 212). Care must be taken, however, that no damage be done beyond what is necessary for the public good, for that is the ground on which alone the legal character of fox-hunting can be maintained. It was found, moreover, in the Earl of Essex *v.* Capel (1 Chitt. Game L. 114), that though pursuing a fox on another's land be justifiable, yet, if it take to earth, or to a house there, it is not justifiable to dig or break doors for it. In Scotland, where, from the character of the country, fox-hunting is often impossible, it never has become a national sport to the same extent as in England; and consequently, the rule that one is entitled to enter on the lands of another for the purpose of killing a fox, has been confined to those cases in which he is pursued simply as a noxious beast, and fox-hunting for sport without leave has been held to be punishable as a trespass, and the trespasser held liable for whatever surface-damage he may occasion. In Ireland (by 1 and 2 Will. IV. c. 32, s. 35), persons pursuing with hounds any fox, hare, or deer which has been started elsewhere on another's land, are exempted from summary proceedings for trespass.

FOXGLOVE. See DIGITALIS.

FOXHOUND, a kind of dog much used in Britain for the sport of fox-hunting. It is not quite so large as the staghound, and is perhaps a mixed breed between the staghound or the bloodhound and the greyhound. The colour is commonly white, with large patches of black and tan colour. Their speed and perseverance are remarkable; they have been known 'to run hard for ten hours before they came up with and killed the fox, and the sportsmen were either thrown out, or changed horses three times.'

FOX-HUNTING, from its exciting nature, as well as from the qualities of daring courage and cool calculation requisite in those who thoroughly follow and appreciate it, has long been termed the king of British national sports.

In Great Britain, there are upwards of 100 hunting establishments, of which by far the greater proportion belong to the counties south of the Tweed. Fox-hunting establishments—which are in most instances supported by subscription, though sometimes owned by private gentlemen of wealth and influence—are organised and maintained at a very considerable annual cost, the price of a single pack of foxhounds sometimes amounting to several thousand guineas. Every establishment is under the direct superintendence and one experienced gentleman, the *master*, a him again rank the huntsman, whippers-i stopper, kennel-servants, &c. A 'pack' is of from 20 to 60 couples of hounds, the greatly depending upon the frequency of days: thus, some packs hunt six days, days, others four, and many only tw week; 30 couple of hounds is a good these are carefully reared, fed, and attended to. The master himself, as of course, has the general superintenden servants, hounds, and horses; and in the field is general director of the proceedi to him come the huntsman and 'whippers-in' ('whips'). The huntsman practically the most important personag field, requires to see that his hounds perly managed and fed in their kenne led to the place of meeting on hun and, what is of more consequence still, receive fair-play in the field, and find their foxes in true style. The huntsman to be a man of great nerve and much he should also have a good head, a clea voice, a keen eye, and above all he must b rate horseman, and know thoroughly in the country over which he hunts. He to restrain heedless riders, and 'keep back;' a duty requiring firmness of charac a quiet and civil manner. With these qualifications, and having so many duties on his shoulders, he is treated respect by those for whom he provides is mounted on the best horses his can produce, and may be said to cond direct the hunt from the moment the found till the moment of its death—fr to finish.'

The duties of the first whipper-in, though responsible as those of the huntsman, are siderable: for instance, he takes a certain ment of the hounds in kennel, assists in co the hounds to the 'meet,' and aids the h in various ways during the run. His k of the management of hounds, and of fo generally, must at the same time be enable him to occupy the huntsman's pla emergency. The 'second whip's' principal that of bringing up and urging on in the field, by lashing and 'ratin hunts, however, a second whipper-in is with.

A considerable range of country is the full enjoyment of fox-hunting, the that which is diversified by pasturage tion. Being a nocturnal feeder, the fox burrow or 'earth'—which is generally brake, or a plantation or covert of during the night, and returns to it in and this fact is taken advantage of by hunt him for sport. The day and place are duly advertised, and on the night hunt, the coverts to be 'drawn' next day either by a duly appointed *earth-stopper* gamekeeper, who, knowing that the fox home, proceeds, spade in hand, from another, filling them up with earth wood as he goes. Thus, the fox, at dawn to his 'earth,' finds ingress betakes himself to some neighbouri some unenclosed cover of gorse, he makes a temporary lair or 'ken the earths have been carefully closed, stopper returns home and informs the or first 'whip,' as to their number and that information forms a guide for the proceedings of the following day. (After the hunt is over, the earths are reopened, and as little trace as possible left of the work.) The hour of 'the meet' is usually ten or eleven o'clock A.M., and at the appointed place assemble the whole field, including master, huntsman, whippers-in, hounds, and those gentlemen (and frequently ladies) who intend either to participate in the day's sport, or merely to see the 'hounds throw off.' When a covert is reached, the huntsman, by a wave of his hand, or a few familiar words, such as 'Eu in! eu in there! good dogs!' 'throws in' his hounds, following immediately after with the first 'whip.' The mounted gentlemen usually remain outside, and take their directions as to stance, &c., from the master, who from this time forward does his best to control and direct their move- nts. In fact, the master may be said to have control of the 'field' that is, the riders the huntsman that of the hounds and hunt. second whip being posted at the covert near where it is expected a fox may burst or 'break,' one or two of the more eager are sometimes permitted to jump their into the covert, if it be large, to assist in ding of the fox. Those who remain outside prepare themselves for their work, and eagerly for the first token of the presence of rey- : this is betrayed by a slight but anxious er or whine from the 'challenging' hound , the hound (usually an old and experienced , that first perceives or 'hits' the scent of a fox nd is soon followed by others, who instantly to his side. The huntsman, if he be tolerably that the game scented is no other than at judicious intervals urges on his hounds iliar expressions, such as 'Yoicks, yoicks, at him!' 'Push him up!' &c., till the fairly roused from his kennel, and goes y. It not unfrequently happens while drawing rts, that hounds will come suddenly upon a and seize him before he has time to escape. is termed 'chopping,' and is always to be d if possible. If the covert be very thick, ay leave his kennel unperceived; and when so, he usually runs through or round covert for a considerable distance before it for the open fields. He may also 'run ' by doubling back and forward on the path or track, and thus possibly baffle the ds, even when they 'own his scent.' In large s, too, a fox frequently 'hangs;' that is, he s in it for a long time before going away. person who first sees the fox 'break cover,' or, ther words, 'views him away,' should always him a certain 'law' before giving the 'view ,' as a fox will frequently turn or 'head ' into covert if he hears any unusual noise at instant of his quitting it. When, however, the n or persons who are watching see that the really off, notice is instantly given to those the thicket, and those without, by the cry u—y! hou—y! Tallyho! *Gone away!* GONE -AY!!' upon which the huntsman blows his to collect his hounds; the whipper-in drives gging members of the pack, either with his p or by some cry; the master restrains the e impatience of the riders till the huntsman hounds have 'settled to' their fox; and then and the entire field join in the chase, and the t, and frequently the most exciting part of the 's proceedings has commenced—the fox has oke cover,' the hounds have been 'laid on,' and field has entered on its impetuous 'first burst.' ertain etiquette is, however, absolutely necessary in allowing the hounds and huntsman to get away *first;* but after that, each rider, with a certain deference to the master, chooses his own place in the hunt, and does his best, independently of his neighbours, to keep at a certain distance, not directly in the line, but to one side and in the rear of the hounds. When a rider happens to be near the pack at the first burst, and gets a good position in following them, he is said to 'get well away with the hounds;' and if well mounted and a skilful rider, his chances of both viewing the hunt and being 'in at the death' are very considerable. And now, as we have already said, begins the grand excitement of the day; the fox being fresh, races away at tremendous speed, followed by perhaps upwards of twenty couple of hounds at full cry. If the day is propitious (a 'southerly wind and cloudy sky' having long retained favour), the scent of the retreating fox lies well, especially at first, when it is called 'burning' or 'breast high,' and is for many minutes 'owned' by at least all the leading hounds in the pack, though, perhaps, the object of pursuit itself is far ahead, and out of sight; and away streams the hunt over hedges, ditches, and gates, across rivers, railways, arable land, and grass pastures, perhaps for several miles before a single *check* occurs. Now, the foxhound hunts almost entirely by scent, and does not, like the greyhound, depend upon the eye. The fact of scent failing, therefore, at any time during the hunt, throws out the hounds, and prevents them from renewing it, until the scent is recovered, or 'hit off.' When the scent is 'burning,' hounds run almost mute, though at first, and at intervals afterwards, they usually 'throw their tongues' pretty freely. When all the hounds are giving tongue, they are said to be at 'full cry,' and 'carry a good head,' the scent being on such occasions so thoroughly diffused as to be felt or 'owned' breast high by probably every member of the pack. Sometimes scent becomes so faint as to be hardly perceptible, and when this is the case, the energy of the hounds abates considerably; they then run with their heads close to the ground, and are said to hunt a 'cold' scent. Here, however, a little timely assistance from the huntsman is of the greatest moment in restoring animation to the pack. He waves his cap, blows his horn, and encourages his hounds by well-known expressions, to renewed exertions. When, as frequently happens from various causes, the scent fails entirely—such as the fox

Fox-hunting—'Gone away!'

crossing water, running through a drove of sheep, 'heading back' in another direction, running along or lying upon the tops of walls or thick hedges, &c.—the hounds cease 'giving tongue,' suddenly stop, throw up their heads, and are 'at fault.' In this emergency, the 'field' remains at a respectful distance behind, and the huntsman knowing, or at least guessing by experience which way the fox has taken, or the special means he has adopted for foiling the scent, allows his hounds at first, for a few moments, themselves to attempt to regain it; but failing that, and finding that his interference and assistance are necessary, he instantly blows his horn, and calls or 'lifts his hounds' from the place, and 'takes a cast' round and round about the spot where the scent failed, cheering them on the while. Thus, by gradually widening his casts, the scent is very frequently recovered or 'hit off,' a circumstance which is soon made apparent by the whimper of recognition given by the hound that first 'owns it,' followed by the answering tongues of the whole pack. When the hounds, however, fail to 'hit off' the scent, if the day be far advanced, they are taken home, or they are trotted on to some neighbouring covert, which is drawn for a fresh fox.

When the fox is killed, either in 'the open' or elsewhere, the rider who is first in at 'the death'—usually the huntsman—springs off his horse, with a 'Whoo! whoop!' lashes the hounds off, an

Blood Hunter clearing a stone wall in good style (from Blaine's *Encyclopædia of Rural Sports*).

The midland counties of England, such as L
Northampton, Warwick, Yorkshire, &c., are for hunting purposes in Great Britain; and owe their superiority in a great measure to two causes: 1*st*, the strict preservation and consequent number of foxes; and 2*d*, the extensive tracts of pasturage being favourable both for running and scent. The instinct of the fox leads him, as a general rule, to run *down* wind, that his scent may not be blown *to* the hounds; he also takes advantage of every peculiarity in a country likely to offer him an advantage over his foes.

The fox-hunter must be possessed of considerable courage, united with coolness, and must be a judge of pace and have a good eye in 'riding to hounds,' to avoid tiring or 'overmarking' his horse unnecessarily. Much of the excitement and pleasure of the fox-hunter consists in his successfully leaping the various hedges, ditches, fences, &c., enc
but at the same time, a really skil
rider, however well mounted, will
urge his horse at a fence or leap of any
he is positively certain it is within his

strength.

Much useful and entertaining informatio
hunting occurs in Blaine's *Encyclopædia* o
Sports (London, Longmans); *British*
by Stonehenge; Beckford's *Thoughts* —
Reminiscences of a Huntsman; *Nimrod*;
newspaper; &c.

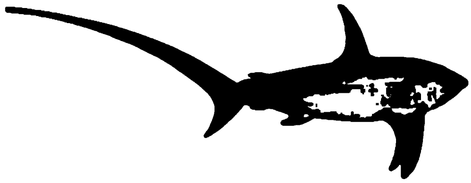
Fox-hunting is not practised after the

fashion in the northern states of America, but in the southern states from Maryland to Florida, it is a favourite amusement. The object of pursuit, however, is the *Gray Fox* (*Vulpes Virginianus*), and the chase is not so severe, and seldom lasts so long as that of the common fox.

FOX ISLANDS, another name for the ALEUTIAN ISLANDS (q. v.).

FOX RIVER is the name of two considerable streams in the United States of America, both of them rising in Wisconsin. 1. The F. R., or *Pishtaka*, is an affluent of the Illinois, which is itself a tributary of the Mississippi. It is 200 miles long, and is valuable chiefly for its water-power. 2. The F. R., or *Neenah*, after a course of about the same length, falls into Green Bay in Lake Michigan. It is divided into two sections by Lake Winnebago, the wer one being connected by a canal with the sconsin, so as to link together the Mississippi and Great Lakes of the St Lawrence.

FOX SHARK, or **THRESHER** (*Alopias* or *Alopecias*), a genus of sharks, containing only one wn species (*A. vulpes*), an inhabitant of the diterranean and of the Atlantic, and occasionally



Fox Shark (*Alopias vulpes*).

n on the British coasts. The snout is short and ical; the spout holes are very small; the mouth t so large as that of the white shark, nor the so formidable; but the F. S. is extremely ld and voracious, readily attacking grampuses or hins much larger than itself. Its most remarkable peculiarity is the great elongation of the upper of the tail fin, which is nearly equal in length the whole body, and into which the vertebral mn extends. Of this it makes use as a weapon, ng with great force. It is said to be not uncommon for a whole herd of dolphins to take flight at the first splash of the tail of a fox shark. From the use which it makes of its tail, it has acquired the name of Thresher. It attains a length, tail included, of 13 feet. The body is spindle-shaped.

Foxtail Grass (*Alopecurus pratensis*):
a, glumes; b, floret.

FOXTAIL GRASS (*Alopecurus*), a genus of Grasses, distinguished by a spiked panicle, two *glumes* nearly equal, and generally united at the base, enclosing a single floret which has a single *palea*, with an awn rising from the base. The species are chiefly natives of temperate countries, and about six are British. MEADOW TAIL GRASS (*A. pratensis*), which has an erect oth culm about 1½ - 2 feet high, and a cylindrical obtuse panicle abundantly covered with silvery hairs, is one of the best meadow and pasture grasses of Britain, but does not arrive at full perfection till the third year after it is sown. It bears mowing well, and is reckoned a good grass for lawns. It bears drought well. The JOINTED FOXTAIL GRASS (*A. geniculatus*), with an ascending culm bent at the joints, is very common in moist places, and cattle are fond of it, but it is a small grass. The SLENDER FOXTAIL GRASS (*A. agrestis*) is an annual or biennial, of little value except for light sandy soils, on which it is sometimes sown. A foreign species (*A. nigricans*), a native of the continent of Europe and of Siberia, has been introduced into Britain, and appears likely to prove valuable. It has somewhat creeping roots, is a little larger and stronger than *A. pratensis*, and is rather earlier.

FOY, MAXIMILIEN SÉBASTIEN, a distinguished French general and orator, was born at Ham, 3d February 1775. In 1791, he was one of the volunteers who hastened to defend the frontiers of their country against foreign invasion, and during the next nine years served with distinction under Dumouriez, Moreau, and Massena. In 1800, he was raised to the rank of adjutant-general in the division of Moncey, in the army of the Rhine, which marched through Switzerland into Italy, where he commanded the vanguard of the army in 1801. In 1805, he commanded the artillery of the second division in the Austrian campaign. In 1807, Napoleon sent him to Turkey at the head of 1200 artillerymen, to assist Sultan Selim against the Russians and British. After the revolution in which Selim was dethroned, F., under the direction of the French ambassador, General Sebastiani, defended Constantinople and the Strait of the Dardanelles so effectively, that Duckworth, the British admiral, was obliged to retire with loss. From 1808 to 1812, F. was general of division of the army in Portugal. His talents were exhibited to advantage in conducting the retreat of the French army across the Douro. F. was present at all the battles of the Pyrenees, and at Orthez, in 1814, was dangerously wounded. In the campaign of 1815, he commanded a division on the field of Waterloo, where he was wounded for the fifteenth time. In 1819, he was elected deputy by the department of Aisne. In the chamber, he was the constant advocate of constitutional liberty, and showed great rhetorical talent and knowledge of political economy. He distinguished himself particularly by his eloquence in opposing the war against Spain in 1823. F. died at Paris, November 28, 1825. Madame Foy published, in 1827, from her husband's papers, a *Histoire de la Guerre de la Péninsule*. In the previous year appeared his *Discours*, with a biography.

FOYERS, a stream rising in the Monadleadh Mountains, in the middle of Inverness-shire. It runs 12 miles north, and falls into the east side of Loch Ness, nearly opposite Mealfourvonnie Mountain. It has two celebrated falls within a mile and a half of its mouth, where the stream rushes through a deep, narrow ravine in the hills, skirting the east side of the loch. The upper fall is 30 feet high. The stream then descends 30 feet in a quarter of a mile. The lower fall (specially called *The Fall of Foyers*) is 90 feet high. It is the finest cascade in Britain.

FOYLE, LOUGH, an inlet of the Atlantic, on the north coast of Ireland, between the counties of Derry and Donegal. It is triangular in form, 16 miles long from north-east to south-west, 1 mile wide at its entrance, and 9 miles broad along its south side. A great part is dry at low water, and its west side along its banks. Vessels of 600 tons ascend the west side of the Lough, and its chief tributary the Foyle (which comes 16 miles from the south), to Londonderry. On the east shore is a flat strand with a sandy beach, on which in 1827, was measured a line of 41,640 feet, which was afterwards extended by [illegible] to 52,900 feet, and formed the base line of the Ordnance Survey of Ireland.

FRA BARTOLOMEO. See BACCIO DELLA PORTA.

FRACASTORO, GIROLAMO, an Italian savant and philosopher, famous for the universality of his learning, was born of an ancient family at Verona in 1483. At the age of 19, he was appointed professor of logic in the university of Padua. But his vast knowledge embraced the most divergent sciences, and on account of his eminence in the practice of medicine, he was elected physician of the Council of Trent. His Latin verse also exhibits remarkable elegance. He died in 1553. A bronze statue was erected in his honour by the citizens of Padua, while his native city commemorated their great compatriot by a marble statue. His writings in prose and verse are numerous. The chief are—*Syphilis, sive Morbi Gallici* (Verona, 1530, in 4to; Paris, 1531 and 1539, in 8vo; London, 1720, in 4to, and 1746, in 8vo; Italian edition, Verona, 1739, in 4to, by Tiraboschi; Naples, 1731, by Pietro Belli); *De Vini Temperatura* (Venice, 1534, in 4to); *Homocentricorum sive de Stellis, De Causis Criticorum Dierum Libellus* (Venice, 1535, in 4to); *De Sympathia et Antipathia Rerum, De Contagionibus et Contagiosis Morbis, et eorum Curatione* (Venice, 1546, in 4to; Lyon, 1550, 1554, in 8vo). The collective works of F. appeared for the first time, Venice, 1555, in 4to.

FRACTED, heraldically, signifies broken asunder.

FRACTION. In Arithmetic, a fraction is any part or parts of a unit or whole, and it consists of two numbers, a denominator and a numerator, whereof the former shews into how many parts the unit is divided, and the latter shews how many of them are taken in a given case. Thus $\frac{3}{4}$ denotes that the unit is divided into four parts, and that three of them are taken; and more generally $\frac{a}{b}$ denotes that the unit is divided into b parts, and that a of them are taken. A fraction is called *proper* when the numerator is less than the denominator, and *improper* when the numerator is greater than the denominator. In Algebra, any quantity $\frac{a}{b}$ is called a fraction, although a and b are not necessarily representatives of whole numbers, as they would require to be if the fraction be an arithmetical fraction. The algebraical fraction $\frac{a}{b}$ just means that any quantity affected by it is to be multiplied by a, and divided by b. This definition, however, through the greater generality of algebra, includes that of an arithmetical fraction. The rules for the addition and multiplication of fractions are the same in algebra and arithmetic. To add two or more fractions together, we must bring them to a common denominator, and add the numerators for a new numerator, and take the common denominator for the new denominator. Thus if $\frac{a}{b}$, $\frac{c}{d}$ be two fractions, then $\frac{a}{b} + \frac{c}{d} = \frac{ad}{bd} + \frac{bc}{bd} = \frac{ad + bc}{bd}$, the fractions being brought to a common denominator by the general rule—multiplying each numerator by each denominator, except its own, and multiplying all the denominators for the comm nator. To subtract two fractions, we bring a common denominator, and subtract the tors for the new numerator. Thus $\frac{a}{b} - \frac{c}{d} =$

To multiply two fractions together, th multiply the numerators together for a ator, and the denominators together for denominator. Thus $\frac{a}{b} \times \frac{c}{d} = \frac{ac}{bd}$. The all these rules are obvious. The rule of is to invert the divisor, and proceed as plication. This follows from the con that to *divide* is the inverse of to mult that to divide by $\frac{a}{b}$ must be the same as multiply by $\frac{b}{a}$.

FRACTIONS, CONTINUED. If $\frac{A}{B} =$ and $\frac{B}{a_1} = b + \frac{b_1}{a_1}$, and $\frac{a_1}{b_1} = c + \frac{c_1}{b_1}$, and .... $\frac{m_1}{l^1}$, and $\frac{l^1}{m_1} = n + \frac{n^1}{m_1}$, &c.

Then $$\frac{A}{B} = a + \cfrac{1}{b + \cfrac{1}{c + \cfrac{1}{d + \cdots \cfrac{\cdots 1}{m + \cfrac{1}{n + \cdots}}}}}$$

This expression for the value of $\frac{A}{B}$ is called tinued fraction. If we consider the fractions (2) $a + \frac{1}{b}$ or $\frac{ab + 1}{b}$, (3), $a + \cfrac{1}{b + \cfrac{1}{c}}$ or formed by taking into account parts only denominator in the continued fraction, we series of fractions *converging* to the value These converging fractions are always approach-ing to the value of $\frac{A}{B}$, and are alternately less than it. Throughout the series, the 1st, 7th, &c., are each below the true value, 4th, &c., are above it; or *vice versa*, according the original fraction is improper or proper be shewn that the successive convergents approach nearer and nearer to the true continued fraction. Converging fractions great use in the summation of infinite series

In illustration of the above general us take the numerical fraction $\frac{6935}{2151}$, which reduce to a continued fraction in the manner: $\frac{6935}{2151} = 3 + \frac{482}{2151} = 3 + \frac{1}{\frac{2151}{482}} = 3 + \cfrac{1}{4 + \frac{223}{482}}$ = (by continuing the same

$$3 + \cfrac{1}{4 + \cfrac{1}{2 + \cfrac{1}{6 + \cfrac{1}{5 + \cfrac{1}{7}}}}}$$

or, as it is commonly written, $\frac{3}{1} + \frac{1}{4} + \frac{1}{2} + \frac{1}{6} + \frac{1}{5}$

convergent is 3; the second, $\frac{3}{1} + \frac{1}{4}$

hird is $\frac{3}{1} + \frac{1}{4} + \frac{1}{2} = 3 + \frac{2}{9} = \frac{29}{9}$;

the other convergents in a similar have the following approximations to the original fraction:

$$\frac{13}{4},\ \frac{29}{9},\ \frac{187}{58},\ \frac{964}{299},\ \frac{6935}{2151}.$$

es between the successive convergents l fraction are,

$$= \frac{482}{2151}\left(\text{being less than } \frac{1}{1 \times 4}\right),$$

$$= \frac{223}{8604}\left(\text{being less than } \frac{1}{4 \times 9}\right), \text{ \&c.};$$

d the difference between any convergent nal fraction is less than a fraction

$$\frac{1}{\text{vergent} \times \text{denom. of conv. next greater}};$$

, the differences grow less as we ng to the denominators of the conver- increasing. If, by actual subtraction, essively the difference between each nd the original fraction, we shall also y are alternately greater and less, or ater, according as the original fraction mproper.

ONS, VANISHING. In some algebraical substitution of a particular value for quantity will make both the numer- ominator of the fraction vanish; such called vanishing fractions. Thus the $\frac{-1}{-1}$ assumes the form $\frac{0}{0}$ when $x = 1$. nment of the value of such a fraction icular value of the unknown quantity it the form $\frac{0}{0}$, may in all cases be a general method furnished by the alculus. But frequently that value mined by simpler means, as the form $\frac{0}{0}$ e existence of a factor common to both d denominator, which becomes zero for value of x; if, then, we can discover ither by finding the greatest common otherwise, and divide it out, then by we obtain the value of the fraction o the particular value of x. Thus, in en, we find that both terms are $x - 1$, so that $\frac{x^2 - 1}{x - 1} = x + 1$. There- $= 1$, and the fraction becomes $\frac{0}{0}$, its equal 2. This is an example of the f the method of Limits to the determin- value of such a fraction, for it is clear value of $x = 1$, the value of the 2, and continually approaches 2 as x . Much discussion has taken place as anishing fractions have, properly speak- r not; but this is not the place for ulations on the subject. See LIMITS, and NOTHING, and INFINITY.

RE of a bone may be the result of ecular action, or disease. The long limbs are more subject to the latter han those of the head or spine. *Pre- uses* to fracture are frosty weather, cerous disease, a morbidly brittle con- *fragilitas ossium*.

, as the kneepan and heel-bone, are e way from sudden contraction of the h are inserted into them. The subject y then falls, and attributes the accident to the fall, whereas it is the reverse. A medical man, some few years ago, awoke with a fit of cramp, and almost immediately his left thigh-bone broke with a snap. It reunited in the usual time. The sufferer from cancer of long standing, sometimes feels a bone give way under no special strain. In such cases, there is seldom any attempt at repair. The bones of old people are brittle from the excess of earthy materials (see BONE), and so readily give way. The bones of the feeble patient, with fragilitas or mollities ossium, are soft and friable, and when examined, are found saturated with a greasy substance.

There are some persons who seem liable to fracture without any such reason. Professor Gibson of America mentions a boy who, though apparently healthy, had broken his collar-bones eight times, his arm and forearm, while his leg and thigh were broken if he but tripped his foot on the carpet. An old lady once broke both thigh-bones kneeling down in church. There is one predisposing cause to fracture fortunately now but seldom seen—viz., scurvy. Not only did it make the bones brittle, but, as was seen in Lord Anson's expedition, which was manned chiefly by pensioners, old fractures again became disunited.

Repair of a broken Bone.—Of course, as the bone lies in the midst of soft parts, any injury to the one must tear the other, and cause an infusion of blood; but the latter is speedily absorbed, and is of no service in the process of repair. After the first excitement has passed off, a fluid is effused around the fragment, which in a short time becomes converted into bone. The amount of this new material depends upon the position of the fragments; should they be far apart, or, as it is technically termed, riding, then a much larger quantity of new bone is thrown out. We see this in animals to such an extent that the materials for repair, or 'callus,' may be divided into two separate parts—a provisional callus to act as a wrapper to the bones until the permanent callus, or that which unites the ends, however far apart, becomes sufficiently hard; then the provisional callus, being no longer necessary, is removed by absorption.

Symptoms of Fracture.—A broken limb hangs loose, and is, as a general rule, no longer under the control of the muscles, which, however, are pricked by the broken ends of bone, and stimulated into painful spasms, which still further displace and deform the limb. Should there be any doubt, the limb may be carefully raised, and turned gently from side to side, when a peculiar rough feeling termed *crepitus* removes all doubt. Each bone, however, when broken, exhibits symptoms peculiar to itself, and requires a separate treatment.

Fractures are divided into *Simple*, when there is no wound in the skin which communicates with the fracture; *Compound*, when there is such a wound; *Comminuted* being prefixed to either of these terms when the bone is broken into several pieces; *Impacted*, when one fragment is driven into the other; and *Complicated*, when a neighbouring joint or large blood-vessels participate in the accident.

Treatment of Fracture.—Replace the fragments as near as possible to their former positions by gentle extension, retain them in place by substituting an *external* rigid skeleton, made of any unyielding material which will be firm enough to resist the spasms already alluded to, but is not fastened with very great tightness to the limb. *Splints* are generally of wood or pasteboard; but of late years gutta percha has been much used. In simple fractures, it is often sufficient to adapt a bandage to the limb, which will harden on drying, and form a *shell* for it; for this purpose, starch, dextrine, and plaster of [illegible] splint be [illegible] a state of [illegible] would be [illegible] way, and [illegible] the fragments [illegible] a false joint.

Paris are generally used. Whatever the splint be made of, it must keep the bones in a state of *complete rest*, otherwise the lymph, which would be formed into bone, stops, as it were, half way, and becomes fibrous tissue, which allows the fragments to move on each other, and is termed a false joint.

FRA DIA'VOLO, properly MICHELE PEZZA, a celebrated brigand and renegade monk, born in Calabria in 1760. Of plebeian origin, he at first followed the trade of stocking-weaver, then entered the Neapolitan army, and subsequently the service of the pope; finally, he abandoned military life, and became a monk, but being expelled for misconduct, he withdrew to the mountains of Calabria, where he headed a band of desperadoes, whose strongholds lay chiefly in the district between Itri and Terra di Lavoro. Pillage, bloodshed, and atrocious cruelties, signalised his career. For years he evaded the pursuit of justice by retiring to his haunts amidst mountains and forests, and skilfully defeating, with much inferior numbers, all the armed forces despatched against him. He became at length known among the peasantry of the neighbourhood as Fra Diavolo. On the advance of the French into the Neapolitan states, F. D. and his band espoused warmly the royal interests, and in return were not only pardoned and reinstated in civil rights, but promoted to the grade of officers in the royal army, F. D. himself becoming colonel. In 1806 he attempted to excite Calabria against the French, but was taken prisoner at San Severino, and was executed at Naples in November of the same year. The opera of Auber has nothing in common with F. D. but the name. He died uttering imprecations on the queen of Naples and the British admiral, Sidney Smith, whose influence had not sufficed to rescue him from death, although on his capture he produced papers bearing the royal seal, which vouched for his right to the rank of colonel in the royal forces.

FRAGA'RIA. See STRAWBERRY.

FRAME, in Gardening, the covering of any kind of hotbed, flued pit, or cold pit, used for the cultivation of plants not sufficiently hardy for the open air. Frames are of various materials, but generally of wood or iron and glass, and are made in one piece or in sashes according to the size of the hotbed or pit.

FRAME-BRIDGE, a bridge built of timbers framed together in such a manner as to obtain the greatest possible amount of strength with a given quantity of material.

The fundamental principle upon which all such construction is based, is that the timbers shall be so arranged that the weight put upon them shall exert a pulling or a crushing strain, instead of a transverse strain, and, if possible, that the greatest strain shall act as a direct pull in the direction of the fibres of the wood. The construction of a frame-bridge is very similar to that of a roof, excepting that in the bridge a considerable outward thrust upon the abutments is generally permissible, while the walls of a house will not stand this; and that for the bridge a nearly level way on the top is desirable, while for a roof a steep incline is not objectionable, or is even desirable. Fig. 1 represents a simple and usefu form of frame-bridge. It will be seen at once that weight upon the bridge will exert a pulling strai upon the horizontal timber *ab*, and a crushin strain upon *bc* and *ad*, as well as upon the upp timbers, and that the main support is in *ab*, whic must be torn asunder before *ad* and *bc* can be ben or displaced to any considerable extent.

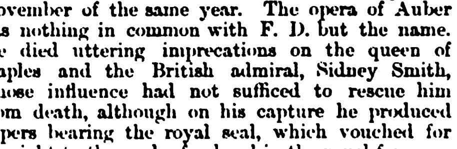

Fig. 1.

The celebrated frame-bridge of Schaffhause constructed in 1757 by Grubenmann, a villag carpenter, was built exactly in the manner of roof with a horizontal pathway superadded. I was composed of two arches, one 193 feet, th other 172 feet span. It was merely laid upon th piers, and did not abut against them to exert an outward thrust, as will be seen by fig. 2. Th weight on the bridge is transmitted by the obliqu beams, which by analogy we may call *rafters*, t the tie-beam *ab*, where it exerts a horizonta pulling strain. These rafters are framed into th tie-beam so as to abut firmly against it in the sam manner as Roof-rafters (see ROOF). This kin of frame-bridge is very common in Switzerland where timber-bridges abound; and it has doubtles originated from the fact, that most of the bridge have been built by the local carpenters, who ar accustomed to the construction of roofs of consider able span for the commodious square-built wooden cottages with overhanging roofs, so common in tha country. Frame-bridges of more complex structur are sometimes built; in some of these, the timber are framed so as to present an arched form. I these cases, the structure is very similar to thos described and figured under CENTERING. The seriou defect of all such bridges is their liability to decay from exposure to moisture, &c., especially at th joints, where water is apt to lodge and remain, fro want of free circulation of air to evaporate it. I the bridge of Schaffhausen above described, it wa found that when it had stood but 26 years, th oak-beams, where they rested on the masonry at a and *b*, fig. 2, were rotted, and the frames began to settle. This was remedied by a carpenter named Spengler, who raised the whole structure upon piles by means of screw-jacks, and replaced the decayed wood. Means should be adopted to admit the free circulation of air in those parts where the timber rests upon the masonry, and to prevent water from settling in the timber joints. The covered bridges of Lucerne and other parts of Switzerland are well known as objects of special interest to tourists, who usually imagine that the roofs are made for the comfort of travellers, but their main object is the preservation of the bridge.

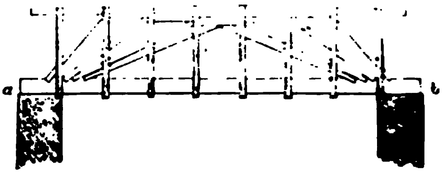

Fig. 2.

FRAMING, the jointing, putting together, or building up of any kind of artificers' work. The framing of timber generally is described under CARPENTRY, and special kinds of framing under CENTERING, DOOR, FLOORS, FRAME-BRIDGE, PARTITIONS, ROOFS, &c. In such trades as mathematical, optical, philosophical, and other complex instrument-making, the workman who does flat-filed work, and fits all the parts, and puts the whole instrument together, is called the *framer*, and his work *framing*.

* According to the most recent official departmental subdivision of France, Belfort is to be incorporated with Haute-Saone, and henceforth the number of the departments is to be 86.

kilomètres, of which nearly the half is composed of maritime coast-lines, which are subdivided in the proportion of about 600 kilom. on the Mediterranean, 950 kilom. on the Atlantic, and about 940 kilom. on the northern frontiers. The superficial area of F., including the two Savoy provinces, and Corsica, a department of the republic, but excluding the departments of the Bas-Rhin and the other territories lost to F. by the treaty of peace concluded with Germany in 1871, is reckoned at about 201,600 sq. miles. The possessions of F. which are situated in non-European parts of the world, have a total superficial area of 463,827 sq. miles, and the largest is Algeria, with an area of 258,310 sq. miles. F. is divided into eighty-six departments (inclusive of Savoy and Nice), most of which have been named from the rivers or mountains by which they are intersected. The foregoing table gives the names of the ancient provinces of F., with the corresponding departments, their chief towns, areas in hectares, and the population for 1872, according to the *Bulletin des Lois de la République Française*.

By the treaties with Germany of February and May 1871, F. lost 1,447,466 hectares of land, and 1,597,228 inhabitants, comprised within 1689 communes, and distributed over five departments. These losses included the whole of the old department of the Bas-Rhin, two arrondissements with a fraction of the third (Belfort) of the department of the Haut-Rhin, the greater portion of the department of the Moselle, together with a number of cantons and communes in the department of the Meurthe and Vosges. The portions of the two departments of the Meurthe and Moselle remaining to F. have been incorporated into one. The area of F. is now (1873) given at 52,875,100 hectares, and the total population, exclusive of Algeria and her colonies, at 36,102,921.

Chief Cities.—The following table gives the populations of some of the largest cities of F. in 1872:

Paris, the capital,	1,800,000
Lyon,	323,000
Marseille,	300,000
Bordeaux,	194,000
Lille,	154,000
Toulouse,	129,000
Nantes,	111,000
Rouen,	100,000

The provinces of Savoy and Nice were ceded to F. by Sardinia, in accordance with a treaty between the two governments, signed in 1861. The following table gives the non-European dependencies of France:

	Area in Hectares.	Population in 1872.
In Africa—		
Algeria,	39,000,000	3,000,000
Senegal and its Dependencies,	undefined	200,000
Ile de Réunion and Ste Marie,	250,000	170,000
Nossi-Bé and Mayotte,	50,000	45,000
In Asia—		
East Indian Possessions,	50,000	170,000
Cochin China,	2,200,000	1,000,000
In America—		
Martinique,	98,000	125,000
Guadeloupe and its Dependencies,	165,000	151,000
Guiana,	1,000,000	25,000
St Pierre and Miquelon,	20,000	3,000
In Oceania—		
Marquesas and other Islands,	117,000	10,000
New Caledonia,	900,000	30,000

The total superficial area of the French colonies, including Algeria, and reckoning the districts under French protection, is estimated at upwards of 50 millions of hectares, and the population at about 4½ millions; but of the latter number more than 3½ millions are natives and savages, or belong to only half-civilised races. The methods employe taking the census are, moreover, so different in different colonies, that the results are not ent beyond question; while the limits of French tectorate authority have been very consider diminished of late years in the Eastern Hemispl and in Africa also, if we except Algeria.

Population.—The population of F. has not bited the same rate of increase as other first- European powers during the present century, while the population of Great Britain has n doubled within the last fifty years, that o scarcely shews an increase of 40 per cent. for same period. At present it is almost station the births shewing a tendency to decrease ra than increase.

The following table shews the condition of population from the beginning of the century to date of the latest census:

Year of Census.	Number of Population.	Annual Increase.
1801,	27,349,003	143,961
1806,	29,107,425	351,685
1821,	30,461,875	90,293
1826,	31,858,937	279 415
1831,	32,569,223	171,787
1836,	33,540,901	194,337
1841,	34,217,719	135,363
1846,	35,400,486	236,553
1851,	35 783,170	76,537
1856,	36,039,364	51,236
1861,	37,382,225	268,572
1866,	38,067,094	136,156
1872,	36,102,921	

The decline of population between the censu May 1866 and of May 1872 is 1,964,273, of wl 1,597,219 is due to the loss of the different territo annexed by conquest to the German empire. remainder is due partly to losses in the war, partly to an absolute decrease in the populatio 73 departments, no increase being perceptible more than 13 of the present 86 departments of F

Coast, Islands, and Frontier.—The north-no west coast is generally irregular, indented numerous bays, the principal of which is the Ba St Malo, the archipelago of Bréhat, &c. The w south-west coast is more lofty and precipitous, is interspersed with isolated rocks and promonto while south of the Loire it is low, and lined salt marshes to the foot of the Pyrenees, wher again assumes a rocky character. Here lie islands of Ushant (Ouessant), Belleisle, Noirm Isle d'Yeu, Ré, Oléron, &c. The coast of the terranean, which is broken by lagoons or shore-la is low till it has passed Toulon, after which becomes bolder. The only islands off the are the Hyères, near Toulon; the larger island Corsica (q. v.) lies north of Sardinia. The Medi ranean here forms two bays or gulfs, as the of Lyons and the Gulf of Genoa, which belo only in part to France. The land frontiers o are formed on the side of Spain by the Pyre on that of Italy and Switzerland, by the Alps Jura chain; on the north-east, the frontier li unprotected by natural boundaries, and since loss of Alsace and Lorraine is no longer defende before the war of 1870–1871, by strong fortres

Plains.—The chief plains are those of Burgu and of the oceanic district, embracing the l basins of the Seine, Loire, and Garonne. There four great mountain chains belonging to Fran the Pyrenees (q. v.), which separate the Fr territory from Spain; the Cevenno-Vosgan ra formed of the Cevennes (q. v.), running east west between the Rhone and Loire, and the Vo running north and south between the Moselle the new boundary line; the Alps (q. v.), wl separate the Swiss territory from the province

and Nice; and the Sardo-Corsican range,
belongs, as the name implies, to the islands
ia and Corsica. The highest peaks in the
are the Maladetta and Mont Perdu (10,886
1(4 feet); in the Cevenno-Vosgian
nest height (the Widderkalm) does
xceed 7000 feet. The French portion
now includes several of the highest
nd most elevated passes of the range,
nc, 15,744 feet; Mont Iseran, 13,272
Cenis, 11,457 feet; and the pass of
rnard, 7190 feet, &c. In Corsica, the
rises to an elevation of 9000

, fully 4000 springs not hitherto

&c.—F. presents a great variety of
mations, but although we meet with
mplete succession of all the stratified
tified formations, they are distributed
inequality. Thus, for instance, while
third of the soil is composed of tertiary
a mere fractional part only is made
eds. A belt of primary rocks, forming
of some portions of the Vosges, Alps,
, and of the great plateaux of Brittany
ndée, encircles the great central basin
the volcanic formation of the mountains of Auvergne, with their extinct craters, lava-streams, &c. The spaces between this external breast-work and its volcanic nucleus is occupied by secondary and tertiary formations. Alluvial deposits are met with in all the valleys, but they occur in extensive beds only in the neighbourhood of Dunkirk and Niort, and on the borders of the Mediterranean. According to M. Maurice Block's estimate, the physical and agricultural character of the soil of F. may be comprised under the following heads:

	Hectares.
Mountainous districts, heaths, and commons,	9,944,839
Rich land, ...	7,276,369
Chalk or lime districts, ...	9,788,197
Gravel, stony, and sandy, ...	15,951,618
Clay, marshy, miscellaneous, ...	9,807,577
	52,768,600

The same writer further subdivides the soil of F. according to its actual employment under the following heads:

	Per cent. of the whole area.
Arable lands, ...	48·3
Meadow lands, ...	9·7
Vineyards, ...	3·7
Cultivated lands, ...	17·8
Roads, streets, public walks, &c., ...	3·7
Forests and unproductive lands, ...	16·8

Climate.—F. possesses one of the finest climates in Europe, although, owing to its great extent of area, very considerable diversities of temperature are to be met with; thus, for instance, the north-east parts of the country have a continental, and the north-west parts an oceanic climate, resembling those of Germany and Great Britain; while the Mediterranean districts are exposed at times to the ravages of the burning winds which have passed over the deserts of Africa, and to the destructive north-west wind known as the *mistral*, which often does great injury to the fields near the mouths of the Rhone and Var. The mean annual temperature of different parts of F. has been estimated as follows by Humboldt: Toulon, 62° F.; Marseille, 59·5°; Bordeaux, 56°; Nantes, 55·2°; Paris, 51·2°; Dunkirk, 50·5°.

Products.—Of the vegetable products of F., which, from varied climatic and geognostic relations, are necessarily characterised by great abundance and diversity, the most generally cultivated are the cereals, the vine, chestnuts, olives, culinary fruits and vegetables, hops, beet-root for the manufacture of sugar, tobacco, madder, chicory, flax, &c. In 1862, the yield of wheat in F. was 116 millions of hectolitres, the maximum annual quantity as yet on record. During the last 50 years, the importation of cereals has so far exceeded the supplies for home consumption and exportation, as to leave F. the loser by 850 millions of francs. The cultivation of wheat has gradually increased during the last fifty years, but that of rye, barley, and maize has exhibited little variation; while the growth of potatoes has been most extensively augmented during the same period. The following table shews the fluctuations to which these alimentary substances have been subjected:

E OF LAND OCCUPIED IN 1815, 1830, 1845, AND 1869.

mean annual yields of these productions be estimated as follows: Wheat, 73,000,000 hectolitres; rye, 22,000,000 hectolitres; barley and oats, 40,000,000 hectolitres; maize, 9,100,000

ıtatoes, 95,000,000 hectolitres.* The
f farms, the short leases (of less
) on which the majority are let, and
mber of the great land-owners who
ıeir estates, have hitherto tended to
ogress of agriculture in France. Agri-
ıibitions have been held since 1850;
ıcs are annually given in prizes, &c.;
re now nearly one thousand agricultural
s in different parts of France.

ıufacture of sugar from beet-root, which
igin during the great wars of the early
e century, has been prosecuted with much
uring the last 50 years, and about 150
of kilogrammes † are annually manufactured.
e appearance of the vine-disease, beet-root
ı extensively employed in the manufacture
ıol; and in 1857, the quantity prepared
ed to 429,000 hectolitres. The cultivation is
limited to the north and east; hemp and flax
own chiefly in the northern, but also in the
western departments. The entire produc-
of hemp was estimated in 1842 at 67,507,076
rammes, worth 86,287,300 francs; and that of
at 36,875,400 kilogrammes, worth 57,507,400
cs. Since that period, there has been little
erence in the home production, but an enormous
rease in the importation of foreign flax and
np; the average annual value of flax, for the
riod between 1857 and 1866, being 46 millions,
d of hemp 8 millions of francs. The cultiva-
on of the mulberry-tree derives importance from
s bearing on the production of silk. In 1858,
he department du Gard had monopolised nearly
ıalf the culture of these trees, which in its
aggregate amount has continued unchanged. From its connection with the mulberry, we here refer to the production of silk, which began at the opening of the 17th c., and which in 1790 had reached such vast dimensions, that the produce at that period was already 6½ million kilogrammes of cocoons, worth 16½ million francs. Since that period, it has exhibited great variations. From 1840 to 1853, the production continued steadily to increase from 17 to 26 millions of kilogrammes; but the diseases to which the silkworm has been liable since that period have reduced the yield of silk to so great an extent, that in 1857 it scarcely amounted to 7 millions of cocoons. Raw silk, since the abatement of this disease, has again assumed its place among the chief sources of industrial wealth in F.; and, besides the enormous quantity consumed in home manufactures, the annual exports for the period between 1857 and 1866 amounted on an average to 69 millions of francs.

The vine has, from a very early period, constituted one of the principal sources of the agricultural wealth of France. The choicest wines are grown in the Bordelais, Burgundy, and Champagne, but some excellent kinds are produced on the banks of the Loire, and in some of the southern departments. The breadth of soil devoted to this culture fluctuates, but may be stated at about 2,000,000 hectares. The mean produce for every hectare was, in 1788, 21 hectolitres 21 litres; in 1829, 27 hectolitres 20 litres; in 1850, 32 hectolitres 35 litres. In recent times, the fungus known as the oïdium, which has attacked the vine, has inflicted such serious damage on the plant, that in 1854 (the worst year), the hectare yielded 5 hectolitres, instead of the average quantity of 23 hectolitres. The following table will shew some of the annual yields between the years 1808 and 1869:

PRODUCTION OF WINE.

	Hectolitres.		Hectolitr
1808, . .	28,000,000	1854, . .	10,7[illegible]
1829 . .	30,973,000	1858, . .	45,8[illegible]
1848, . .	51,622,150	1869, . .	62,0[illegible]

The average yearly produce of the vineyards
F. is estimated at about 50 millions of hectoli
(about 1000 millions of gallons). Of this, about
is made into brandy. F. consumes nearly all
wine raised on her soil; the annual exports b
on an average little more than 2 millions of he
litres, valued at about 218 millions of francs,
the years between 1857 and 1866—the latest pe
in regard to which we possess official informatio

destruction of the national forests has been enorm
within the last two centuries, but measures h
been taken in recent years to plant wood,
order to protect those mountain slopes which
exposed to inundations from alpine torrents, and
provide a supply for the ever-increasing demand
wood for purposes of fuel. About one-seventh
the entire territory of F. is still covered w
wood. Turf taken from the marshy lands is ext
sively used, more especially in the rural distri
for fuel.

Animals.—F. is not so well stocked with dome
animals as her great resources might warrant us
assuming that she ought to be. During the
years intervening from 1812 to 1862, the numb
of horned cattle have almost doubled in Fran
According to the census of 1866—the most rec
in regard to animals—there were in F. 3,312
horses, 518,000 asses, 350,000 mules, 12,733
horned cattle, 30,386,000 sheep, 5,500,000 sw
and 1,680,000 goats. There were, according to
Statistique Agricole for 1858, about 3 millions
bee-hives, valued at rather more than 24 mi
of francs; the mean annual returns are, for h
6,670,000, and for wax, 1,620,000 kilogram

Rheims stands conspicuous for its *merinos* and fine flannels; Amiens and Nancy for their fine printed woollen goods; Lodève and Elbeuf for army cloths. Gloves are made at Grenoble, Paris, &c. The best carpets are made at Aubusson, Abbeville, and Amiens. Paris is the seat of industry for some of the most costly fabrics, as Gobelins tapestry, shawls of great value, watches, clocks, articles of *vertu*, carriages, philosophical instruments, &c. Sèvres stands unrivalled for its china and glass. St Gobain and St Quirin manufacture looking-glasses of the largest size.

The trade of F. is inferior only to that of England and the United States. The great emporiums of trade are Paris, Lyon, St Etienne, Lille, Rheims, Nîmes, Toulouse, St Quentin, Orleans, Avignon, Montpellier, &c.; and the most active maritime ports are Marseille, Cette, Havre, Bordeaux, Nantes, Rouen, Calais, Dunkirk, Boulogne, Dieppe, &c. These centres of trade have all suffered at different periods during the present century, from the political disturbances under successive governments; but notwithstanding these drawbacks, the commercial activity of the country had made rapid strides within the last 30 years before the war of 1870—1871. The following table shews the condition of trade during four years of the old monarchy:

Years.	Value of Imports in millions of francs.	Value of Exports in millions of francs.	Total.
1787, . . .	551	440	991
1788, ...	517	466	983
1789, . . .	577	441	1018
1792, .	929	803	1732

While the rate of this progress during five years preceding 1872 has been as follows:

Years	Imports in millions of francs	Exports in millions of francs.	Total.
1867, . . .	3026	2825	5851
1868, ...	3303	2789	6092
1869, ...	3153	3074	6227
1870, ...	2781	2860	5641
1871, . .	3393	2685	6078

The transit trade of F. is effected by maritime navigation between foreign and French ports, by coasting traffic, or *cabotage*, between various French ports, and by railways. The merchant navy, which has increased extensively of late years, numbered, in 1870, exclusive of small fishing-vessels—'bateaux de la pêche côtière'—15,778 vessels, having a tonnage of 1,074,656; of the latter number, 454 were steamers of 142,949 tons and 57,523 horse-power. The *cabotage*, or internal and coasting traffic, is a great source of financial wealth to the state, to which all rivers and canals belong. There is a length of 13,155 kilomètres available for inland navigation in France, but, according to official reports, three-fourths of the entire traffic is concentrated upon 1800 kilomètres of this distance. Of this number, 73 per cent. belonged to the ocean ports, and 27 per cent. to the Mediterranean.

Railways, &c.—According to the latest official report for December 1871, the railways in operation measure 22,500 kilomètres, or about 14,000 miles. With the exception of less than 200 miles, the railways of F. are held by six companies, which are under the superintendence of the state, from which they receive the following subsidies as defined by the budget for 1873:

	Francs
Eastern line, . . .	57,200,000
Western line, ...	82,000,000

quintal equals 1·97 cwt.

334,769,469 francs; and the total number of passengers conveyed by rail, 37,952,398. In 1865, the number was 81,533,061; and in 1869, the latest period for which any return is published, 111,164,284. By a clause in the treaty of 1871, the whole of the lines of the Eastern Company in Alsace-Lorraine, about 700 kilomètres in length, were sold to the imperial government of Germany for 325 millions of francs.

The creation of the first highroads in F. is referred to Philippe Auguste; and their more perfect organisation in the 16th and 17th centuries, to Henry IV. and Louis XIV. Under Napoleon I. there were 125 highroads, extending in all over 30,000 kilomètres; and at the present time there are upwards of 600 national roads (35,000 kilom.), 265,000 departmental roads (45,000 kilom.).

Postal Service.—The postal service in F. goes back to the year 1464, when Louis XI. placed it under the direction of the state. Since 1848, a system of low prepayment for letters has been established. At the present time, letters weighing from under 10 to under 100 grammes require stamps from 15 centimes to 1 franc 20 centimes, according to weight. The whole receipt of the postal service was for the year 1871, 91,242,000 francs; while for 1869, before the war, it was 94,199,359 francs; the expenses in the meanwhile have risen from 63 million francs in 1869, to nearly 67 millions of francs in 1871.

Electric Telegraph.—The first electric telegraph was constructed in F. in 1844, and F. is now intersected by a close network of wires, which flash communications between Paris, as the central focus, and every part of the empire. At the close of 1871, there were 43,811 kilomètres of lines, comprising 122,653 kilomètres of wire. The number of telegraphic messages sent in 1871 was 7,447,466, of which about ¼th were international.

Constitution, Government.—On September 4, 1870, the emperor, Napoleon III., was declared to be no longer the head of the state, and France was proclaimed a republic. At the close of 1872, the supreme power was vested in a National Assembly, with whom rests the nomination of the chief officer of the state, bearing the title of 'President of the French Republic;' and nominated for an undetermined period. This officer, as chief of the executive power, but under responsibility to the National Assembly, is authorised to promulgate and insure the proper execution of all laws and ordinances transmitted to him by the president of the Assembly. The National Assembly is composed of 750 deputies, or members, elected by universal suffrage, and eligible without further conditions than those of citizenship as Frenchmen, and qualifications of character and age, besides that of not being either préfet or sous-préfet of the department for which the candidate wishes to be elected. The budget (for 1873) is charged 8,624,000 francs for the administrative expenses of the National Assembly and the authorised indemnities of the deputies. To the President of the Republic belongs, in accordance with the principles that have regulated the respective domains of legislative and executive power in F. under all forms of government, the right of appointing the judges, commanding the forces, and maintaining relations and settling treaties with foreign states, in respect to which acts he is responsible to the assembly. He appoints and dismisses the ministers of state, who are also responsible to the assembly, and he may reside at the seat of the National Assembly, and, provided he gives notice of his intentions, may take part in its deliberations. His salary was fixed in 1873 at 600,000 francs (£25,000), with an extra allowance of 162,000 francs for household expenses. The office of president is held by Marshal MacMahon, who succeeded M. Louis Adolphe Thiers in 1873, and who has been appointed for seven years.

The ministry is presided over by nine ministers of state, each of whom has a definitely limited sphere of administrative duty and authority; and in addition, the president is assisted in the government by a Council of State, 'Conseil d'Etat,' which, according to a decree of the National Assembly, is to consist in all of 43 members, 15 of whom may be nominated by the president, while the remaining 28 are selected by the Assembly. The functions of this body are restricted to giving advice on bills presented to the National Assembly by the president or the ministers.

Departments, &c.—F. is at present divided into 86 *departments*, comprising 362 *arrondissements*, 2865 *cantons*, and 35,985 *communes*. Each department is presided over by a préfet, nominated by the president of the republic on the presentation of the minister of the interior; each arrondissement by a sub-préfet; each canton by a member at the general council of the département, which meets annually for whatever period may be decreed by the head of the state; and every commune has its *maire* and municipal council. Every chief town of a canton has its commissary of police; in the larger towns, there must be one of these officers to every 10,000 inhabitants. The administration of justice is presided over by a special minister of state, who is keeper of the seals. A supreme tribunal serves as a court of appeal from the lower courts. The tribunals of commerce and police, together with those of the several departments, take cognizance of the various civil and criminal cases specially falling within their several spheres. There are 357 tribunals of the arrondissements, or *tribunaux de première instance*, which are divided into six classes; 2681 police courts; 216 tribunals of commerce; 26 courts of appeal, divided into four classes; a *Cour de Cassation*, divided into three chambers, which confirms or annuls the sentences of the police and assize courts; and a *Haute Cour de Justice*, which gives final judgment in all cases of offence against the state. Assizes are held every three months in 59 towns; and, independently of the ordinary judicial magistrates, the courts of assize are composed of juries of twelve men, chosen in accordance with certain prescribed regulations. In the maritime and commercial towns there were, under the empire, 85 councils of *prud'hommes* (experienced men), with summary jurisdiction in matters to the amount of 200 francs. These councils, which are composed of master-workmen elected annually, decide on causes of dispute, chiefly in regard to questions of wages, and differences between masters and men. The state is charged 33½ millions of francs annually for the expenses incident to the ministry of justice, according to the budget for 1873. There are 387 departmental prisons, 21 central houses of detention, 2 political prisons at Doullens and Belleisle, and numerous penitentiaries and reformatories for the young. All these prisons, excepting the two for political offenders, are in part self supporting. The only hulks, *bagnes*, still remaining are at Toulon, where convicts of a certain class undergo their sentences, but the principal penal settlement is in French Guiana (q. v.).

Religion, Churches.—No person can be molested in F. on account of his religious opinions, provided the manifestation of them does not disturb the public peace as established by law. The public exercise of any special form of religion must, however, be preceded by the official authorisation of the préfet, or in special cases, by higher authority. The *recognised* forms of faith are—the Roman Catholic, stant (including the Reformed and , the Jewish, and, for Algeria, the Moham- he clergy attached to these religions ir pay from the state, and are exempt ary service. The Roman Catholic Church great majority of the people. Of the which constitute the present population 000 appertain to the two Protestant 00 to the Jewish persuasion; and recognised but tolerated denomina- Anabaptists comprising nearly one-third er.

aking out of the Revolution, the annual f the church amounted to 150,000,000 of l its debts to 133,000,000. The state ed to itself the funds of the church in assumed the responsibility of maintaining ship. The following table gives a sum- e expenses incurred by the state for the se of religion since the Consulate.

struction.—Public instruction is presided by a special ministry. Nearly half the cted with it are defrayed by the state, er by the departments. There are ocated in the following towns: , Bordeaux, Caen, Clermont, Dijon, ble, Lyon, Montpellier, Nancy, Paris, se, Toulon. These academies are divided into the five faculties of theology, law, medicine, sciences, and literature, and supplemented by various superior and preparatory schools. The professors are paid partly by the state, and partly by fees. There are 81 normal schools intended to train teachers for the higher departments of instruction. Secondary instruction has received an immense impetus during the present century. In 1866, there were 41,800 free and public schools for boys, and 14,000 communal schools for the use of girls, and the entire number of scholars exceeded four millions. In 1863, the number of children over eight and under eleven, who had never been to school, amounted to about 200,000. In 1866, about 30 per cent. of the military conscripts were unable to read. The different departments share very unequally in the diffusion of education, and it may be generally observed that the proportion of the educated is highest in the northern and eastern districts of F. F. supports numerous colleges and schools for instruction in special branches of knowledge: as L'Ecole des Chartes; des Langues Orientales; des Beaux-Arts, founded in 1671 by Louis XIV.; de Dessin, founded in 1766 by Louis XV.; the Conservatoire de Musique, founded in 1784; L'Ecole de Rome, founded by Louis XIV., and L'Ecole d'Athènes, founded in 1846; L'Ecole des Ponts et Chaussées, for the instruction of engineers of public works; L'Ecole des Mines (1783); the Conservatoire National des Arts et Metiers, for the application of science to the arts and trades; the Central School des Arts et Metiers; and the national schools for arts and trades. There are numerous agricultural, forest, farming, and veterinary schools, besides the Ecole Polytechnique, specially designed to prepare youths for the public services; and military and naval colleges at St Cyr, Saumur, Paris, Vincennes, Brest, Toulon, and St Denis.

Literary and Scientific Institutions.—Among the literary and scientific institutions of F. the first is L'Institut de France (q. v.). The Museum of Natural History, known formerly as the Jardin du Roi, is one of the finest in the world. The Bureau des Longitudes and the Observatoire, at Paris and Marseille, have occupied the first rank among scientific institutions since their foundation. These establishments are all maintained at the cost of the state. Paris possesses several libraries belonging to and supported by the state, but freely opened to the public. The most important of all is that now known as La Bibliothèque Nationale. See LIBRARIES. There are 338 public libraries in the provinces, to all of which access is afforded in the most liberal spirit. F. is rich in public galleries of painting, statuary, and articles of *vertu*. The expenses of secondary and primary education, literary and scientific institutions, national archives, &c., are charged in the budget for 1873 at 40,700,000 francs.

Theatres. The theatre, like all other public institutions, is under the surveillance of the state, which charges the annual budget for the maintenance of theatrical companies; about 6½ millions of francs being inscribed on the budget of 1873 for the support of theatres, the fine arts, &c.

Charitable Institutions. F. is rich in institutions of charity, many of which are remnants of the old system of church relief; but the *crèches*, of which there are several hundreds, and which are, in fact, free nurseries, are a modern form of charity, which originated (in 1844) with M. Marbeau at Paris. The public hospitals and infirmaries are maintained by special endowments, a percentage on the receipts at theatres and other places of amusement, and by subsidies from the government and local communes. Public charities for the relief of paupers derive their resources either from departmental or municipal funds, and are administered by the *bureaux de bienfaisance*, by the *dépôts de mendicité*, and by numerous other local institutions; besides which, the state contributes between 8 and 9 millions of francs (for 1873, 8,784,000 francs) for charitable purposes.

Taxation, Finances.—The public revenues are obtained in F. from direct and indirect taxation, and comprised in the budget, voted by the National Assembly, under the heads of ordinary resources and special resources; the former including direct and indirect taxes, from stamps, the produce of forests, telegraphs, Algeria, &c.; and the latter, departmental funds, special imposts, &c. The following table shews the financial report of the public receipts and expenditure for different years from 1815 to 1873:

Years.	Receipts, in francs.	Expenditure, in francs.
1815,	743,830,200	798,590,859
1824,	994,971,962	992,583,233
1830,	1,031,796,054	1,095,142,115
1840,	1,234,483,099	1,363,711,102
1850,	1,431,622,471	1,472,537,238
1859,	1,766,080,877	1,773,919,114
1871,	2,190,120,590	2,161,262,952
1873,	2,467,470,630	2,374,804,134*

Public Debt.—In 1814, the date of the Restoration, the interest of the debt was 63 million francs; under the Bourbons it rose to 200 millions; and from 1830 to 1848, Louis Philippe increased it to 244 millions. During the three years of the second republic, 5 millions were paid off; but the second empire (1852–1869) added nearly 120 millions to the annual burden. The increase of the debt during the empire arose from a succession of loans raised by borrowing directly from the mass of small capitalists, without the intervention of large banking-houses. The amount of the national debt of France is very variously given according to what is included under that head; but if we take the funded debt bearing *rentes* or interest, the amount of such *rentes* in January 1870, before the war, is stated at 358 million francs = about £14,000,000, representing a capital of 11,500 million francs, or £460,000,000. The loans and other obligations incurred to meet the expenses of the war of 1870—1871, including the indemnity of 5 milliards of francs to Germany, have at least doubled this sum, so that the national debt of France may be stated in round numbers at 23,000 millions (23 milliards) of francs. It has been calculated that when all the expenditure arising out of the war shall have been fully provided for, the annual interest of the debt will amount to one milliard of francs, or £40,000,000.

The continual deficits from the close of the first empire in 1815 to the close of the second empire in 1870, have been covered by loans, inscribed in what is known as *le grand livre de la dette publique*, and bearing interest or *rentes* at the rate of 3, 4, 4½, and 5 per cent. The budgets voted annually by the representatives of the nation have almost invariably shewn a small assumed surplus; while the *compte définitif* for the corresponding period, when published some years afterwards, has without exception exhibited a large deficit. The following table shews the rate at which these deficits have increased since 1814. But as the deficits for 1868 and 1869 have not yet been ascertained, their amount can only be given conjecturally as estimated from official sources.

Periods.	Amount of Deficits. Francs
Bourbon Monarchy, from 1815 to 1830,	22,550,000
Reign of Louis Philippe, from 1830 to 1848,	907,866,000
Second Republic, from 1848 to 1852,	359,871,000
Second Empire, from 1852 to 1870,	2,141,050,500

The total value of the French money in circulation is 12,630,657,996 francs. According to the act of monetary union effected between France, Belgium, Switzerland, and Italy, the emission of coined pieces is to be at the rate of 6 francs for every inhabitant, which, taking into account the presumed increase of population to the year 1880, when the term of the treaty expires, gives for France the sum of 239 millions; for Belgium 32, for Italy 141, and for Switzerland 17 millions of francs. The amount of specie in reserve in the bank in January 1873, was 790,000,000 francs; the amount of notes in circulation by the bank and its branches was 2,858,619,270 francs. The maximum amount of notes in circulation has been fixed at 3,000,000,000 francs, by the decree of the National Assembly of July 1872.

Army.—Standing armies date in F. from the time of Charles VII. The law of 1832 regulated the system of recruiting by conscription, on the footing which, with few modifications, it has subsequently occupied. By the law of 1872, substitution and enlistment for money are prohibited, and the principle of universal liability to arms is laid down, in accordance with which every Frenchman must be for five years in the 'active army,' for four years in the reserve of the same, for five years in the territorial army, and for six years in the reserve of the territorial army. Besides the ordinary physical causes of exemption, there are various others admitted, arising from family, social, or individual conditions; while, moreover, young men who pass the necessary examination, may obtain exemption by enlisting as volunteers for one year only, and defraying the cost of their maintenance and clothing. The returns for 1871 gave the strength of the French army as follows: Peace-footing—404,192 men, 86,366 horses; war-footing—757,727 men, 143,238 horses; while the estimated cost was somewhat more than 430 millions of francs. According to the estimates for 1873, the French army is calculated at 545,000 men, including 425,000 infantry, 84,000 cavalry, and 36,000 other troops; and the presumed expenses at 431,023,300 francs. F. is divided into six military commands, or *corps d'armée*, each under a field-marshal, which are subdivided into districts commanded by generals of division, and into lesser circles, corresponding with the departments, and under generals of brigades. The fortified *chefs-lieux* are at Arras, Bayonne, Besançon, Bourges, Brest, Cherbourg, Grenoble, Langres, La Rochelle, Le Havre, Lille, Lyon, Marseille, Montpellier, Nantes, Perpignan, St Omer, Toulon, and Toulouse. Metz and Strasburg were formerly included in this number, but since their annexation by Germany, Avignon, Perpignan, Quiberon, and Rouen have been converted into military chefs-lieux in their place. B regular troops, F. has its *Garde Nationale*, was created in 1789, and legally organised in Since 1852, the sphere of its obligations has limited to the maintenance of order in case threatened insurrection.

Navy.—In December 1871, the French numbered 2 admirals, 18 vice-admirals, admirals, 132 captains of first-class men-of- captains of frigates, 820 lieutenants, and 160 The sailors afloat and on shore numbered which, together with engineers, &c., brou grand total of those employed in the fleet to The inscription for the navy owes its syste organisation to the great minister Colbert At present, all persons engaged in any avocation between the ages of 18 and liable to inscription, but the service is o for three years. There are 170,000 names rolls. Of these, 130,000 may be called out of war. The fleet consists of 401 vessels ying 3045 guns; of these, 388 are , which, including 62 ironclads, screw and and floating-batteries, have a total f 92,627. There are 22,400 marines in in war, and 25,500 customs and coast- a. F. has 6 dépôts for marine artillery. ures, and 2 manufactories for projectiles. are special hospitals, schools, and libraries use of the navy; and 5 maritime districts, ded into 12 arrondissements, at which are strative courts for the settlement of all naval na.

re.—Gallia (Eng. *Gaul*) was the ancient er which F. was designated by the who knew little of the country till the Cæsar, when it was occupied by the s of the Aquitani, Celtæ, and Belgæ, who inhabited the south-west, the west and the north and north-east parts. also some tribes of Germans, Ligurians, s, but the latter never penetrated far shores of the Mediterranean, where sed colonies, the most important of which alia (Marseille). Under Augustus, Gaul ed into four provinces, which, under succes- rors, were dismembered, and subdivided teen. In the decline of the Roman ul was ravaged by neighbouring hordes, , c. it fell completely under the power ths, Burgundians, and Franks. In oris, a chief of the Salian Franks, lf to supreme power in the north. , known as the Merovingian, ended in of Childeric III., who was deposed, 752 the kingly power had already passed nds of the former Maire du Palais, Pepin and, after him, into those of Charles d Pepin le Bref. The accession of Pepin vigour to the monarchy, which, under nd successor Charlemagne, crowned em- West in 800 (768–814), rose to the most powerful empire of the West. , civilisation, and letters were protected reign, and before his death he had d the limits of his empire from the Eider German Ocean to the Ebro and the Medi- n, and from the Atlantic to the Baltic. him, however, this vast fabric of power d to pieces, and his weak descendants d the ruin of the Frankish empire by the berment of its various parts among the r branches of the Carlovingian family. Intestine wars desolated the land, and foreign assailants threatened it on every side. In 911 A.D., the ravages of the Northmen had assumed so persistent a character, that Charles le Simple was glad to purchase immunity from their encroachments by the cession of the territory subsequently known as Normandy. Anarchy reigned paramount; the various governors established an hereditary authority in their several governments, and the crown was by degrees deprived of the noblest part of its appanages. The power of some of the vassals surpassed that of the kings; and on the death of Louis V. the Carlovingian dynasty was replaced by that of Hugues, Count of Paris, whose son, Hugues Capet, was elected king by the army, and consecrated at Rheims, 987 A.D. At this period, the greater part of F. was held by almost independent lords, and the authority of the Capetian kings extended little beyond Paris and Orleans. Louis le Gros (1108–1137) was the first of the race who reinstated order. He promoted the establishment of the feudal system, abolished serfdom on his own estates, secured corporate rights to the cities under his jurisdiction, and gave efficiency to the central authority of the crown. A greater degree of general order was thus secured, while a new element in the state was generated by the foundation of a free burgher class. Louis carried on a war against Henry I. of England; and when the latter allied himself with the Emperor Henry V. of Germany against F., he brought into the field an army of 200,000 men, whose ready appearance afforded the first instance of the existence of a common national feeling of patriotism, ready to respond to the appeal of the sovereign. The *oriflamme* is said to have been borne aloft for the first time on this occasion as the national standard. Louis VII. (*Le Jeune*), who took part in the second crusade (1137–1180), was almost incessantly engaged in war with Henry II. of England. His son and successor, Philippe Auguste (1180–1223) recovered Normandy, Maine, Touraine, and Poitou from John of England, and increased the power of the crown in various other parts of France. He took an active personal share in the Crusades, and permitted the pope to organise a cruel persecution against the Albigenses in the southern parts of the country. Philippe was the first to levy a tax for the maintenance of a standing army, and in his reign a chamber of peers, of six secular and six ecclesiastical members, was instituted, to act as a council of state. Many noble institutions date their origin from this reign, as the university of Paris, the Louvre, &c. By the amendment of the administration of justice, the right of appeal to the royal courts was established, and the arbitrary power of the great vassals crippled. Improvements in the mode of administering the law were continued under his son, Louis VIII. (1223–1226), and his grandson, Louis IX. (1226–1270), who caused a code of laws (*Établissements de St Louis*) to be promulgated. St Louis also effected many modifications in the fiscal department, and, before his departure for the Crusades, secured the rights of the Gallican Church by a special statute, in order to counteract the constantly increasing assumptions of the papal power. Under his son, Philippe III. (1270–1285), titles of nobility were first conferred by letters-patent. He added Valois and the *comtés* of Toulouse and Vermandois to the crown. Philippe IV. (1285–1314), surnamed *Le Bel*, acquired Navarre, Champagne, and Brie by marriage. With a view of securing support against the secular and ecclesiastical nobility, with whom he was constantly at war, Philippe gave prominence to the burgher element in the nation, and on 28th March 1302, he, for the first time, called together the *états généraux*, or general estates, at which the *tiers état*, or burgher class, appeared together with the nobles and clergy. These changes were, however, accompanied by arbitrary innovations in the fiscal and other departments of the government, which were effected with reckless haste and violence. With a view of securing to the crown the great fiefs, he abrogated the right of females to succeed to landed property. His tyrannical persecution of the Templars shewed the extent to which the regal power could be stretched; and under his successors, Louis X. (1314-1316), Philippe V. (1316—1321), and Charles IV. (*Le Bel*), (1321—1328), the last direct descendant of the Capetian line, the rule of the kings of F. became even more unlimited, whilst the court was given up to every species of luxurious indulgence known to the age. Philippe VI., the first of the House of Valois (1328—1350), a distant relative of Charles IV., and the nephew of Philippe IV., succeeded in right of the salic law. His reign, and those of his successors, Jean (1350—1364) and Charles V. (*Le Sage*), (1364—1380), were disturbed by constant wars with Edward III. of England, who laid claim to the throne in right of his mother, a daughter of Philippe le Bel. The war began in 1339; in 1346, the battle of Crécy was fought; at the battle of Poitiers (1356), Jean was made captive; and before its final close after the death of Edward (1377), the state was reduced to bankruptcy, the nobility excited to rebellion, and the mass of the people sunk in barbarism. Falsification of the coinage, onerous taxation, and arbitrary conscriptions, brought the country to the verge of irretrievable ruin, while the victories of England humbled the sovereign, annihilated the French armies, and cut down the flower of the nation. The long and weak minority of Richard II. diverted the English from the prosecution of their groundless claims to the kingdom of F., which revived somewhat from the effect of its long and disastrous warfare; but during the regency for the minor, Charles VI. (*Le Bien Aimé*), (1380—1422), the war was renewed with increased vigour on the part of the English nation, who were stimulated by the daring valour of Henry V. The signal victory won by the English at Azincourt in 1415; the treason and rebellion of the French princes of the blood, who governed the larger provinces; the ambition of the several regents, the ultimate imbecility of the king, the profligacy of his queen, and the love of pleasure early evinced by the dauphin; all combined to aid Henry in his attempts upon the throne. But the premature death of Henry, the persevering spirit of the people, and the extraordinary influence exercised over her countrymen by the Maid of Orleans, concurred in bringing about a thorough reaction, and, after a period of murder, rapine, and anarchy, Charles VII. (*Le Victorieux*), (1422—1461) was crowned at Rheims. He obtained from the Estates General a regular tax (*taille*) for the maintenance of paid soldiers, to keep in check the mercenaries and marauders who pillaged the country. The policy of his successor, Louis XI. (1461—1483), the first king entitled 'His most Christian Majesty,' favoured the burgher and trading classes at the expense of the nobles, while he humbled the power of the crown-princes. He was a crafty ruler, who managed the finances well, and succeeded, by policy and good luck, in recovering for the crown the territories of Maine, Anjou, and Provence; while he made himself master of some portions of the territories of Charles the Bold, Duke of Burgundy. Charles VIII. (1483—1498), by his marriage with Anne of Brittany, secured that powerful state, and consolidated the increasing power of the crown. With him ended the direct male succession of the House of Valois. Louis XII. (1498—1515), (*Le Père du Peuple*) was the only representative of the *Valois-Orléans* family. The tendency of his reign was to confirm the regal supremacy, while the general condition of the people was ameliorated. He and his successor, Francis I. (1515—1547), of the *Valois-Angoulême* branch, wasted their resources in futile attempts to establish their hereditary claims to Lombardy, and were thus perpetually embroiled with the House of Austria. A *concordat* with the pope, signed in 1516, secured the nomination of the Gallican bishops to the king. In this reign, the Assembly of Notables and Deputies superseded the General Estates. The defeat of Francis at the battle of Pavia, in 1525, and his subsequent imprisonment at Madrid, threw the affairs of the nation into the greatest disorder, and embarrassed the public finances to a most ruinous extent. Arts and literature were encouraged in this reign, and in that of the succeeding monarch, Henri II. (1547—1559), who continued the disastrous Italian war. In the latter reign began the persecutions of the Protestants, which were carried on with still greater cruelty under Henri's three sons, Francis II. (1559—1560), Charles IX. (1560—1574), and Henri III. (1574—1589), the last of this branch of the *Valois*. The massacre of St Bartholomew (1572) was perpetrated under the direction of the queen-mother, Catharine de' Medici, and the confederation of the League, at the head of which were the Guises. The wars of the League, which were carried on by the latter against the Bourbon branches of the princes of the blood-royal, involved the whole nation in their vortex. The succession of Henri IV. of Navarre (1589—1610), a Bourbon prince, descended from a younger son of St Louis, allayed the fury of these religious wars, but his recantation of Protestantism in favour of Catholicism, disappointed his own party. The early part of his reign was perpetually disturbed by the mutinies of the troops and the rebellions of the nobles. By degrees, however, Henri, through the astute counsels of his minister Sully, and by his own personal popularity, raised the power of the crown higher than ever, while he began a system of thorough administrative reform, which was only arrested by his assassination by the fanatic Ravaillac. During the minority of his son, Louis XIII. (1610—1643), Cardinal Richelieu, under the nominal regency of Marie de' Medici, the queen-mother, ruled F. with a firm hand, although his oppression of the Protestants at home, and his co-operation with them abroad, in endeavouring to humble the House of Austria, entailed long and costly wars with little fame on France. Cardinal Mazarine, under the regency of the queen-mother Anne of Austria, exerted nearly equal power for some time during the minority of Louis XIV. (1643—1715). The wars of the Fronde, the misconduct of the parliament, and the humbling of the nobility, gave rise to another civil war, but with the assumption of power by young Louis, a new era commenced, and till the close of his long reign, the military succes- the French were most brilliant, and the bound of F. were enlarged very nearly to what they before the war of 1870—1871. The military glo- the kingdom was maintained by a host of commanders, amongst whom stood conspicuous names of Turenne, Vauban, Luxembourg, C Vendôme, Boufflers, and Créqui, while, by the sighted policy of the minister Louvois, a well-organised army and a newly-created navy made the po of F. formidable to all neighbouring nations. progress of the people in the arts of peace was less marked. At the close of his rule, the oppressive war-taxes, the profligacy of the court, the luxurious lives of the clergy, and the absolutism and lu of the aged monarch, combined to undermine

nopolised the principal share of the
and left to the lower classes the
of paying the taxes. At the
volution, the French nobility were sunk in profligacy, and fallen to the lowest stage of demoralisation. The clergy kept pace with the nobles in general depravity, and while their aggregate revenues amounted, according to Necker, to 130,000,000 of livres, and their landed property stood in the relation of 1 to 5⅔ of that of all other proprietors, their contributions towards the maintenance of the state were inadequate and irregular. The open profligacy and excesses of many of the higher members of the hierarchy, moreover, brought the whole order into disrepute. Francis I. had wrung from the church a tithe, known as the *décime paschaline*, and every five years the clergy were expected to present their so-called *dons gratuits ordinaires*, of from 15 to 18 million of livres; while on occasions of need they from time to time made extraordinary *dons gratuits*, which, however, were usually repaid at long intervals. The *tiers état* were crushed by the weight of an unjust taxation, which was rendered more obnoxious by the system of farming out some of the taxes. The most tyrannical of these was the tax on salt. The municipal institutions which had been permitted to flourish under some of the Valois princes in the middle ages, were almost entirely abolished, and the offices of towns, like those of the state and the courts of justice, were either hereditary or open to purchase. The *tiers état*, which included professional men, and all who were not either members of the noble or the clerical orders, saw themselves utterly excluded from all participation in the privileges and duties of free citizens, at the very time when the extensive circulation of the writings of the philosophers of the 18th c., as Voltaire, Malesherbes, Rousseau, and Montesquieu, had habituated men's minds to the discussion of questions of political independence, equal rights, and universal freedom.

The resistance made by Louis and his advisers to the reasonable demands of the Deputies on the 17th June 1789, led to the constitution of the National Assembly a measure which was followed, on the 23d of June, by a declaration of the inviolability of the members. The king retaliated by ordering a large body of troops under arms, dissolved his ministry, and banished Necker, whom he had shortly before recalled under the pressure of public opinion. The consequence was the outbreak of insurrectionary movements at Paris, where blood was shed on the 12th July. On the following day, the national guard was convoked; and on the 14th, the people took possession of the Bastille. The provinces repeated the acts of Paris, and everywhere national guards and revolutionary municipal councils were called together. On the 4th of August, feudal and manorial rights were abrogated by the National Assembly, which gave expression to a solemn declaration of the equality of human rights. The royal princes and all the nobles who could escape sought safety in flight. The royal family having attempted in vain to follow their example, tried to conciliate the people by the feigned assumption of republican sentiments; but on the 5th October, the rabble, followed by numbers of the national guard, attacked Versailles, and compelled the king and his family to remove to Paris, whither the Assembly also moved. The next two years witnessed the solemn inauguration and the subsequent retraction of various constitutional schemes; the princes of the blood and the ancient noblesse raised corps of emigrés in different parts of the country, but their efforts could not arrest the spread of republicanism. The king alternately made concessions to the republicans, and cherished schemes for escaping from their surveillance, but each month added to his humiliations and to the audacity of those surrounding him. A war with Austria was begun in April 1792; and the defeat of the French was visited on Louis, who was confined in August with his family in the Temple. The advance of the Prussians into Champagne threw Paris into the wildest excitement. The National Assembly dissolved itself in September. In December, the king was brought to trial, and called upon to answer for repeated acts of treason against the republic. On the 20th January 1793, sentence of death was passed upon him; and on the following day he was beheaded. Revolts burst out in every part of France. England, Holland, Spain, Naples, and the German States combined together against the republic. Christianity was now formally deposed, and the sacredness of the republic and the worship of Reason solemnised. Marie Antoinette, the widowed queen, was guillotined; the dauphin and his surviving relatives suffered every indignity that malignity could devise. A reign of blood and terror succeeded. Danton and Robespierre, after having condemned countless numbers to the guillotine, suffered each in turn a similar fate. After the destruction of the Terrorists, a reaction was gradually established; the people were wearied of bloodshed, and anxious for peace and order at any cost. The brilliant exploits of the young general, Napoleon Bonaparte, in Italy, turned men's thoughts to other channels. In 1795, a general amnesty was declared, peace was concluded with Prussia and Spain, and the war was carried on with redoubled vigour against Austria. The Revolution had reached a turning-point. A Directory was formed to administer the government, which was now conducted in a spirit of order and conciliation. In 1797, Bonaparte and his brother-commanders were omnipotent in Italy. Austria was compelled to give up Belgium, accede to peace on any terms, and recognise the Cisalpine Republic. The glory of the French arms was re-established abroad, but at home the nation were still suffering from the shock of the Revolution. The Directory repudiated two-thirds of the national debt, and thus almost ruined the commerce and credit of France. Under the pretext of attacking England, a fleet of 400 ships and an army of 36,000 picked men were equipped; their destination proved, however, to be Egypt, whither the Directory sent Bonaparte; but the young general, resigning the command to Kleber, landed in F. in 1799, and at once succeeded in supplanting the Directory, and securing his own nomination as Consul, conjointly with Sièyes and Roger Ducos. In 1800, a new constitution was promulgated, which, although in appearance purely constitutional, in reality vested the sole executive power in Bonaparte, who shewed consummate skill in re-organising the government, to which he imparted a systematic efficiency and a spirit of centralisation, that secured a thoroughly practical administration. Having resumed his military duties, he marched an army over the Alps, attacked the Austrians unawares, and decided the fate of Italy by his victory at Marengo. In 1801, the peace of Lunèville was concluded, and the boundaries of F. were extended to the Rhine. England was the only country which refused to recognise the legality of the various Italian and German conquests of F.; and with the exception of a brief period of peace, this country remained the implacable foe of Bonaparte from the days of the Consulate to his defeat at Waterloo. Every period of respite from war was employed by the First Consul in reinstating trade and industry, and in obliterating both in private and public life the stains left by the Reign of Terror. In 1804, on an appeal by universal suffrage to the nation, Bonaparte was proclaimed emperor. The pope came to Paris to crown him and Josephine; a new nobility was rapidly creat the relatives and favourites of the emperor vanquished kingdoms and principalities at his For a time, Napoleon's influence with the we powers of the continent succeeded in mai an injurious system of blockade against E and, except in the Peninsula, his arms were where victorious. By his marriage with th duchess Maria Louisa, daughter of the Em Germany, Napoleon seemed to have given throne the prestige of birth, which alone lacked. He now availed himself of the afforded by the peace with Austria to exp material prosperity of the country, by enco trade, constructing roads, bridges, and ca every part of the empire, and by consolidat government, and organising a complete code and a systematic mode of administering them this period was the poorest in respect to the and scientific development of the nation, wh too much trammelled by police supervisio military discipline to exercise freedom of t and intellect, and this interval of comparative was soon interrupted by the ambitious desi Napoleon on Germany, which led to a declara war against Russia in 1812. his own acts of personal government. The result of the appeal made to the nation in 1870, on the plea of securing their sanction for his policy, was not what he had anticipated; and the 50,000 dissentient votes given by the troops in this plebiscite, revealed a hitherto unsuspected source of danger. Confident in the efficiency of the army, and anxious to rekindle its ardour, he availed himself of a pretext to declare war against Prussia. The course of events in the short but terrible Franco-German conflict of 1870—1871 electrified Europe by its unexpected character, revealing at once the solidity of Prussian strength, and the hollowness of imperial power in F. Within a fortnight of the emperor's appearance at the head of his troops at Metz, July 28, 1870, the strength of the French army was annihilated, Alsace and Lorraine were occupied by Germans, and the Chamber of Deputies in Paris was clamouring for his abdication. On September 2, Napoleon, with his army of 90,000 men, surrendered at Sedan, and on the 4th, Paris was in rebellion, the senate dissolved, the Empress Regent a fugitive on her way to England, and F. proclaimed a Republic amid tumultuous excitement. Before the close of September, Strasburg, one of the last hopes of F., had capitulated, and Paris was completely invested by German troops; and on 5th October, the Prussian king had taken up his headquarters at Versailles. The fall of Metz, with 200,000 men, completed the disasters of the year. In January 1871, the united efforts of the different branches of 'the Provisional Government of Defence,' respectively installed at Paris and Tours, succeeded in bringing about an armistice, after the besieged Parisians had for four months been hourly exposed to the fire of the enemy, cut off from all communication with the outer world except by balloons and carrier-pigeons, and finally threatened by famine. With the concurrence of Prussia, the French nation now proceeded, by a general election of representatives, to provide for the exigencies of the country. The First National Assembly of the French Republic met at Bordeaux in February. After receiving from the Provisional Government of Defence the resignation of the powers confided to them in September 1870, the Assembly undertook to organise the Republican Government, and nominated M. Thiers chief of the executive power of the state, with the title of President of the French Republic, but with the condition of responsibility to the National Assembly. On the 1st of March the preliminaries of peace were finally ratified at Bordeaux, the chief conditions being that the province of Alsace (except Belfort) and part of Lorraine, including Metz, should be ceded to the German empire, and that F. should pay a war indemnity of 5000 millions of francs, and continue to be occupied by German troops till the money was all paid. This enormous obligation was discharged in September 1873, and during the same month, F., after an occupation of three years, was finally relieved from the presence of foreign troops. In the spring of 1871, the peace of F. was seriously threatened by a successful outbreak at Paris on the part of the Communists (q. v.), who after great bloodshed and grievous damage to public and private property, were quelled by the regular army, which had sided with the government, and on 29th of May order was restored in Paris. Since then, F. has been successfully trying to obliterate some of the numerous misfortunes resulting from the war, and commerce and national prosperity are beginning to revive. The death of the ex-Emperor Napoleon, in 1872, at Chiselhurst, where he had resided with his family since his liberation in March 1871; the retirement of M. Thiers; and the election of Marshal MacMahon to the dignity of President of the French Republic, appear to have been alike indifferent to the nation at large, and have produced no political excitement of any kind in the country.

FRANCE, ISLE OF. See MAURITIUS.

FRANCESCO DI PAULA, founder of the order of the *Minims*, was born in 1416 at Paula or Paolo, a village of Calabria. From birth, his destination was the church, for which he was happily fitted by nature and preference. At the age of 12, he was the inmate of a Franciscan convent, practising with the utmost rigour the regulations of the order; and at 14, renouncing all worldly possessions, he retired to a cave, where he inflicted on himself every species of self-mortification, and devoted his time to prayer and meditation. The fame of his piety having attracted to his cell several emulators of his austere life, he received permission from the bishop to erect a church and convent, and the new community received from Pope Sixtus IV. the title of the Hermits of St Francis. To the usual conventual vows, F. added one of the most rigorous abstinence—flesh, eggs, and milk being strictly forbidden the entire year, except in illness. Popular report having attributed to F. several wonderful cures, Louis XI. of France, the most superstitious of monarchs, being severely ill, summoned him to his presence, in hopes of some miraculous display of power on his behalf. F. repaired to France, where he was received with the highest honour, and attended the king on his death-bed. The successors of Louis, Charles VIII. and Louis XII., treated F. with great favour, consulted him in important matters, and induced him to settle in France. Charles VIII. built him a convent at Plessis-le-Tour, and another at Amboise. F. died at the former in 1507, and was canonised in 1519.

FRANCHE COMTÉ, an old province in the east of France, in the basin of the Rhone, comprised what now forms the departments of Doubs, Haute-Saône, and Jura, and had for its capital Besançon.

FRANCHISE. In its political acceptation, the franchise may be said to be the right which centres in the individual holding it to exercise a certain limited portion of the general sovereignty of the state. A franchise in this sense is possible only in a free state, i. e., in a state in which the governed, as a whole, are identical with the governors. It does not necessarily involve the idea of representative government; for where legislation is effected by the votes of the people themselves, as it was in the small states of antiquity, the franchise is exercised by each individual directly, without the intervention of any representative machinery. Where representation has been introduced, the franchise is the right which the citizen has of voting for his representative, not the right of voting in the legislative body conferred on the representative in consequence of being sent thither, and is an expression not of the sovereignty which centres in him, but of that which belongs to the constituents who send him. There would be no theoretical inconsistency, however, in applying the term franchise to the right of voting in the House of Lords, which belongs to each peer, because he here exercises the sovereignty, or original freedom which belongs, or is supposed to belong, to himself, and does not represent that of others. As the franchise is the political expression of the sovereignty which centres in each free citizen, the extent or value which ought to belong to the franchise will be measured by the amount of the sovereignty which it expresses. But this sovereignty again corresponds, or finds forms of actual expression, in the social position which the individual occupies, in the amount of power and influence which is conceded to him by the society of which he is a part. A theoretically just franchise, then, would be one which corresponded accurately to the social position of each individual, which translated the verdict by which society fixed his status into the language of politics. But scientific accuracy in such matters, for obvious reasons, is unattainable. An approximation in the individual case is all that is possible in dealing with the mass, and one of the questions which is at present most keenly discussed amongst speculative politicians is, by what test shall this approximate estimate of social value be brought most nearly to the truth. Mr J. S. Mill has proposed intelligence, as indicated by instruction, as the sole measure of individual sovereignty, and, consequently, as the basis of the franchise (see his work on Representative Government). Others have proposed wealth; whilst by a third class of speculators it is contended that, in the case of each individual, there are various elements of social importance which must be taken into account in determining the political value which is his due. By all the more recent writers on the theory of government, however, the idea of all citizens being entitled to an equal suffrage, however great might be the disparity of intelligence, wealth, manhood, and other elements which go to make up social importance, is repudiated as a scientific absurdity, and reprobated as the source of all the practical injustice which results from what are commonly known as democratic governments. See Mill's work, alluded to above; also PARLIAMENT.

FRANCHISE in England is a royal privilege or branch of the crown's prerogative, subsisting in the hands of the subject. Being derived from the crown, franchises must arise from royal grant, or in some cases may be held by prescription, which presupposes a grant (Stephen's *Com.* i. 637). The subjects of franchise being the peculiar property of the crown, correspond with what in Scotland are called REGALIA (q. v.); and a franchise is analogous to a grant of regalia. Gifts of waifs, estrays, wrecks, treasure-trove, royal fish, and forfeitures, all of which are the prerogative of the crown, are franchises. The rights of forest, chase, park, warren, and fishery are also franchises, no subject being entitled so to apply his property for his own convenience. A county palatine (see PALAT highest species of franchise, as within i constable, or other chief officer, may exerc out control the highest functions of the so And as the crown may thus erect an entire into an independent jurisdiction, so it may a liberty or bailiwick independent of the of the county. This, then, is another sp franchise. It is likewise a franchise for a of persons to be incorporated, and subsist as politic, with a power to maintain perpetual sion, and do other corporate acts; and eac vidual member of such corporation is also have a franchise or freedom. The right to ho fair or market, or to establish a ferry, and to tolls therein, is also a franchise. Where the h of a franchise is disturbed in his right, he for damages by an action on the case; case of non-payment of tolls, he has the r Distress (q. v.). Franchises may be ext reunion with the crown, or may be lo —that is, such a use of them as is contrary t express or implied condition on which the grant proceeded—or by *non-user*.

of the petty feuds of the time, he
r, and detained for a year in cap-
. An illness which he there con-
houghts from earth; and although
in military pursuits, a second
ecided his career for life. He now resolved to fulfil literally the counsels of the gospel, and he especially devoted himself to poverty, which, in the mystic language thenceforth familiar to him, he designated as 'his bride.' Under an impulse which he received while listening to a sermon, he took a vow never to refuse alms to a beggar. He made a pilgrimage to the tomb of St Peter at Rome, and there offered to God all that he possessed on earth. On his return to Assisi, he exchanged his clothes with a poor mendicant; and disregarding all remonstrance and ridicule, he ever afterwards continued to wear the meanest attire. He gave to a priest who was rebuilding a ruined church the price of his horse, which he sold for the purpose, and even sought to appropriate to the same use the moneys of his father, which, however, the priest refused to accept. To avoid his father's anger, he took refuge in a cave, in which he spent a month in solitary prayer, and from which he returned more than ever confirmed in his enthusiasm. His father having in vain confined him in a dark room of his own house, cited him before the magistrates, and, on F.'s declining all civil jurisdiction in such a case, before the bishop, in order to compel him to renounce his inheritance. F. abandoned all, even to the very clothes he wore, and then declared that 'till now he had been the son of Bernardini, but that henceforth he had but one Father, Him that is in heaven.' Thenceforth, no humiliation was too low for F.; he begged at the gates of monasteries; he discharged the most menial offices; he served the lepers in the hospital at Gubbio in their most revolting necessities, and with the most tender assiduity. He worked with his own hands at the building of the church of St Damian, and at that of Sta Maria degli Angeli, which he afterwards called his 'Portiuncula,' or 'little inheritance;' and as the last act of self-spoliation, and the final acceptance of the gift of poverty, he threw aside his wallet, his staff, and his shoes, and arrayed himself in a single brown tunic, of coarse woollen cloth, girt with a hempen cord. This was in his 26th year, in 1208. His enthusiasm by degrees excited emulation. Two of his fellow-townsmen, Bernard Quintavalle and Peter Cattano, were his first associates. They were followed, although slowly, by others; and it was not till 1210, that, his brotherhood having now increased to eleven in number, he drew up for them a rule, selected in the true spirit of religious enthusiasm, by thrice opening at random the gospels upon the altar, and taking the passages thus indicated as the basis of the young institute. (Milman's *Latin Christianity*, iv. 264.) The new brethren repaired to Rome, where their rule was approved (though at first only *vivâ voce*) by Pope Innocent III. in 1210. The two following years were spent by the brotherhood in preaching and exhorting the people through the rural districts of their native and the adjoining provinces; and F. himself returned to Assisi in 1212, at which time he finally settled the simple constitution of his order, the church of Sta Maria degli Angeli being assigned to them as their home. In common with the older forms of monastic life, the Franciscan institute is founded on the three vows of chastity, poverty, and obedience; but of these the second was, in the eyes of F., the first in importance and in spiritual efficacy. In other orders, the practice of poverty consisted in the mere negation of riches. With F., it was an active and positive principle. In other orders, although the individuals could not possess, it was lawful for the community to hold, property in common. F. repudiated all idea of property, alike for his order and for its members; he even disclaimed for them the property in those things which they retained for personal use—the

clothes which they wore, the cord with which they were girded, the very breviary from which they chanted the divine office. The very impossibility, to human seeming, of these vows, was their strength. Numbers crowded to the standard of Francis. He told them off in parties to different provinces of Italy. Five of the brotherhood repaired to Marocco to preach to the Moors, and, as the first martyrs of the order, fell victims to their holy daring. Success removed all the hesitation with which the institute at first was regarded, and in 1216, the order was solemnly approved by Pope Innocent. From this date it increased with extraordinary rapidity. At the first general assembly, held in 1219, 5000 members were present; 500 more were claimants for admission. F. himself inaugurated the future missionary character of his brotherhood by going (1223) to the East, and preaching the gospel in the presence of the sultan himself; but the only fruit of his mission was a promise from the sultan of more indulgent treatment for the Christian captives, and, for the Franciscan order, the privilege which they have since enjoyed, as guardians of the Church of the Holy Sepulchre. It is after his return to Italy that his biographers place the celebrated legend, which, to friends or to enemies, has so long been a subject of veneration or of ridicule—his receiving, while in an ecstasy of prayer, the marks (*stigmata*) upon his own person of the wounds of our Divine Redeemer. The scene of this event is laid on Monte Alverno, a place still sacred in the traditions of the order; and the date is September 17, 1224. Two years later, St F. died, October 4, 1226. On the approach of his last hour, he requested that he should be carried upon a bier to the church, where he had himself placed on the bare ground, thus realising in his own death the most literal extreme of the doctrine which he had made in life the basis of his system. He was canonised by Pope Gregory IX. in 1228.

The works of St F. (folio, Pedeponti, 1739) consist of letters, sermons, ascetic treatises, proverbs, moral apothegms, and hymns. The latter are among the earliest metrical specimens of the Italian language. They are exceedingly simple, and full of the tenderest expressions of the love of God. His prose is often more poetical than his poetry itself, abounding in allegory and poetical personification. Few writers have ever turned the love and admiration of external nature to a purpose so beautifully devotional. 'Of all the saints,' says Dean Milman, 'St Francis was the most blameless and gentle.' No saint, it may be added, has been the subject of more exaggerated panegyric from the writers of his order; and one of the works in his praise—a parallel between St F. and our Divine Redeemer—is disowned by the Roman Catholic community as a most reprehensible exaggeration, the fruit of an affectionate, but most misdirected zeal for the memory of the founder of the Franciscan order.

See the Bollandist, *Acta Sanctorum*, October 4; St Bonaventure's Life of St Francis, with Wadding's notes; Helyot, *Hist. des Ordres Religieux*, tom. vii.; Butler's *Lives of Saints*, October 4; Milman's *Latin Christianity*, vol. iv.; Gieseler's *Church History*, vol. iii.; Döllinger's *History of the Church*; *St Francis and the Franciscans* (Dublin, 1861).

FRANCIS, SIR PHILIP, son of the Rev. Dr Philip Francis, author of a well-known translation of Horace, was born at Dublin, October 22, 1740, and educated at St Paul's School, London, where he had for a school fellow Henry S. Woodfall, afterwards the printer of the *Public Advertiser*, and the publisher of the *Letters of Junius*. In 1756, he obtained a place in the office of Mr Fox, then secretary of state, which he retained under his successor Mr Pitt. In 1760, he became secretary of Kinnoul, who had been appointed Bri sador to Portugal; and on his return to 1763, he received an appointment in the Ten years later, he was sent out to India ber of the council for the government with a salary of £10,000. Here he cam sion with the governor-general, Warre and so far did the quarrel proceed, that the consequence, in which F. was severel In December 1780, he resigned his sit returning to England, entered parliam borough of Yarmouth, in the Isle of Wig He never obtained a reputation as an his great abilities and extensive informa commanded the respect and attention of The prosecution of Hastings, begun in hailed by him with malignant joy, and confessed that he displayed a most alacrity and activity in furthering the de committee of impeachment. a writer of verses; but these were so bad, that even French critics pronounce them almost intolerable.

FRANCIS I. (STEPHEN), Emperor of Germany, born in 1708, was the eldest son of Leopold, Duke of Lorraine. On the death of his father, in 1729, F. succeeded him in the dukedom, which, in 1735, he ceded to Stanislaus Leszczynski, father-in-law of Louis XV., to revert after his death to the crown of France. In lieu of Lorraine, he obtained the grand duchy of Tuscany, whose native rulers, the Medicean family, were about to die out. In 1736, he married Maria Theresa of Austria, the only daughter and heiress of the Emperor Charles VI. In 1740, Charles died, and Maria Theresa succeeded him; she made her husband co-regent with herself, but gave him little share in the administration. F. fought bravely for his wife's rights in the wars carried on against Frederick the Great. In 1745, he was elected to the once important dignity of Emperor of Germany, and crowned at Frankfurt. The famous Seven Years' War (1756—1763) now broke out between Austria and Prussia; but the cares which it imposed fell mainly upon his leonine consort, Maria Theresa. F. died at Innsprück, 18th August 1765. His son Joseph succeeded him in the imperial dignity, but Maria Theresa retained in her hands the sovereignty of the Austrian dominions till her death.

FRANCIS II., Emperor of Germany, and I. of Austria, the eldest son of Leopold II. Grand Duke of Tuscany, and of Maria Louisa, daughter of Charles III., king of Spain, was born at Florence, in February 1768. In 1790, his father became Emperor of Austria by the death of his brother Joseph, but died only two years after, when the crown devolved upon Francis. The French Revolution was now exciting the alarm of the old European dynasties; F. concluded an alliance with Prussia against the new republic; and the armies of the allies marched to the frontiers of France, but soon recoiled before the fiery enthusiasm of the republican troops. In 1794, F. placed himself at the head of the army of the Netherlands, which, on the 26th of April, defeated the French at Cateau and Landrecy; and on the 22d of May, gained the bloody battle of Tournay; but on the whole the fortune of the war was against him; and the triumphs of young General Bonaparte in Italy forced him to conclude the treaty of Campo Formio (October 17, 1797). Only two years afterwards, however, F., in alliance with Russia and England, again took up arms, and was at first successful; but the recall of the brave Russian general, Suwaroff, and the return of Bonaparte from the East, quickly altered the state of matters. The great victories won by Moreau at Hohenlinden, and by Bonaparte at Marengo, paralysed the powers of Austria, and F. was compelled to sue for peace, which was obtained by the treaty of Lunéville in 1801, by which the whole of the left bank of the Rhine was ceded to France. In 1805, the aggressions of France once more excited the jealousy of Austria. F. entered into a new alliance with Russia; and the contest was renewed, but ended more disastrously than ever for the Austrians. The French victories of Ulm and Austerlitz, and the capture of Vienna, completely humiliated F., who, at the peace of Presburg (December 1805), was obliged to surrender the Venetian states and the Tyrol. The German empire was now dissolved, after lasting for 1000 years, and F. assumed the title of Emperor of Austria, King of Bohemia and Hungary. In 1809, he recommenced the war with Napoleon, and obtained more success, or perhaps we should say, encountered less loss than on previous occasions. The tremendous battle of Aspern *was* a victory, though not a decisive one, and did much to restore the prestige of the Austrian arms. Still Napoleon again got possession of Vienna, and dictated terms of peace from the palace of Schönbrunn in October of the same year. In 1810 the French emperor married F.'s daughter, Maria Louisa. A permanent friendly alliance now seemed to be concluded between the two empires; and during the Russian campaign in 1812, the Austrians rendered the French some slight assistance. In 1813, Austria resumed its neutrality; but, after having exerted himself fruitlessly to mediate between France and Russia, F. suddenly joined the allies, helped to win the battle of Leipsic, and followed the Russians and Prussians to Paris in 1814. His subsequent career does not present any points of special importance. He laboured honestly and indefatigably for the welfare of his subjects, encouraging the making of roads and canals, and the introduction of manufactures; but his horror of everything revolutionary, excited by his early recollections, and by the cruel death of his aunt, Marie Antoinette, and kept alive by his long wars with France, had rendered him an absolutist in politics, and a lover of that system of centralisation to which Austria continues to cling. F. died on the 2d of March 1835.

FRANCIS JOSEPH, the present Emperor of Austria, born 18th August 1830, is the eldest son of the Archduke Francis (son of the Emperor Francis I.), and Sophia, a princess of Bavaria. F. was taught to speak all the various languages of his heterogeneous dominions, and only the year before the Hungarian revolution addressed the Magyar nobles at Pesth in their own language—a circumstance which secured him a certain transient popularity. In 1848, he served under Radetzky in the Italian wars. The Emperor Ferdinand having, in the hour of his extremity, made certain constitutional promises to the nation, the archduchess, F.'s mother, who during the whole year had directed the schemes of the anti-revolutionary party, resolved that the fulfilment of these promises should be evaded by a change of sovereign. Ferdinand accordingly abdicated in favour of his nephew (2d December 1848), and F. assumed the government as Emperor of Austria, and King of Hungary and Bohemia. Hungary, however, which had lost all faith in the House of Hapsburg, rose in arms, and refused to accede to the change of succession; and Italy again tried the fortune of war. The progress of the struggle between F. and the constitutionalists of Hungary is described in the biographies of Kossuth, Bem, Dembinski, Batthyani, &c. Suffice it to say that Austria triumphed in Italy, and also in Hungary, through the alleged treachery of Gorgei and the help of Russia. F. now devoted himself, with characteristic persistency, to the re-establishment of 'order,' that is to say, of despotism. He dissolved the national guard, and took away the freedom of the press, and on January 1, 1852, abolished the constitution of his uncle, which had been a dead-letter from the beginning. In 1853 he nearly lost his life by assassination, and in the Crimean War forfeited the respect of all the belligerents by his indecisive attitude. The *concordat* of 1855, by which certain extraordinary privileges were conferred on the bishops of the Roman Catholic Church, was another step backwards. Meanwhile the dissatisfaction of Lombardy, Venice, and Hungary hourly increased. Sardinia encouraged the national feeling in Italy, and at last, in 1859, F. hurried thoughtlessly into a war with that kingdom, which ended in the cession of Lombardy. For the war with Denmark, see SLESVIG; for the war with Prussia, and the subsequent work of reconstructing the empire, see GERMANY, in SUPP., Vol. X. F. was crowned as king of Hungary at Pesth in 1867. He was present at the opening of the Suez Canal in 1869. See also AUSTRIA, HUNGARY.

FRANCI'SCANS, ORDER OF, also called MINORITES or LESSER BRETHREN, a religious order of the Roman Catholic Church, founded by St Francis of Assisi. For an account of the establishment of the Franciscan order, and its earliest fortunes, see FRANCIS OF ASSISI. The subsequent progress of the order was equally wonderful. In less than half a century it reckoned no fewer than 33 'provinces,' the aggregate number of convents in which exceeded 8000, while the members fell little, if at all, short of 200,000. Some idea, indeed, of the extraordinary extension of this remarkable institute may be formed from the startling fact, that, in the dreadful plague of the Black Death in the following century, no fewer than 124,000 Franciscans fell victims to their zeal for the care of the sick, and for the spiritual ministration to the dying! But this marvellous external progress was accompanied by serious internal controversies and divisions. In the original scheme of the institute, its great fundamental characteristic was poverty, which St Francis proposed to render in his order not only more perfect theoretically, but more systematical in its practice, than it existed in any of the contemporary institutes. For the accomplishment of this design, the rule which he drew up contained a few brief and simple, but, understood literally, very effectual provisions; but the difficulty of their literal observance led, even in the lifetime of St Francis, to an attempt in the general assembly of the order to introduce some important modifications; and, though the authority of the founder was sufficient to prevent the adoption of these modifications during his lifetime, and although his last will contained a special clause prohibiting not merely all change of the rule, but even all interpretation of it, the attempt was renewed with still more determination under Brother Elias, his successor in the office of general of the order. The great subject of controversy was the nature and extent of the obligation of religious poverty, as vowed in the order. Francis desired that it should be understood in the most rigorous sense; and, in his scheme of poverty, neither the individual brethren nor the entire community could acquire or retain any right of property even in things of necessary use. The rigorous party in the order sought to carry out this principle to the fullest extent; and they contended that it was unlawful for the or acquire a right of property in houses, conv even churches; restricting their right in eve which they possessed to the simple use. S successive popes sought, by explanatory d to settle the dispute; and for a time a co mise was received, by which it was understood that the right of property in all *de facto* p sions of the order was vested in the see of R but the foundations of the real controv deeper than this. They regarded the more than the theory, of poverty; and to which they led eventuated not formation of fresh offsets from the body i religious orders to be named hereafter, bu a large, and, for a time, formidable, secessio the church in the sect of the Fraticellians. FRATICELLIANS.

The supreme government of the Franciscan order, which is commonly said to be the especial embodiment of the democratic element in the Roman Catholic Church, is vested in an elective general, who resides at Rome. The subordinate superiors are, first, the 'provincial,' who presides over all the

however, Matteo adopted a
ed course of life, in which
by of the brethren; and the
d so rap among the community, that in the year 1536 a general chapter of the new congregation was held. They were subject, however, to the jurisdiction of the general of the Franciscan order. One of the first generals of the new reform was Bernardino Ochino, afterwards notable by his defection to Calvinism. After the Council of Trent, the Capuchins multiplied rapidly, though they were not introduced in France till the end of that century. A similar reform, to which the name of 'Recollets' was given (introduced in Spain by John de Guadaloupe, in 1500), was approved by Clement VII. in 1532; and many of the new brethren were among the first Spanish missionaries to the New World. A further development of the rigoristic spirit is the congregation of 'Discalced' or 'Barefooted' (q. v.) Franciscans. The author of this reform was a Spanish Capuchin, Peter of Alcantara. In his capacity of provincial of Estremadura, Peter introduced many reforms; and in 1555 obtained the approval of Pope Julius III. for a new rule, which was afterwards confirmed by Pius IV.

The notice of the Franciscan institute would be incomplete without the mention of the several orders of nuns; as those of St Clare, the Capuchinesses, the Urbanist nuns, &c., which formed part of the same general organisation. None of these, however, calls for any detailed explanation, or presents any very characteristic features.

The Franciscan order, in these several branches, has at all times maintained its popularity in the Roman Catholic Church. When Helyot, in the beginning of the 18th c., published his great *History of Religious Orders*, the Franciscan order numbered nearly 120,000 friars, distributed over above 7000 convents, and nearly 30,000 nuns, occupying about 900 convents. Since the French Revolution, the number has of course been very much diminished, the order having been suppressed in more than one kingdom; but it is still one of the most numerous in the Roman Catholic Church. Many of the foreign missions are mainly supplied by Franciscans, and they possess convents in almost every part of the world.

As a literary order, the Franciscans have chiefly been eminent in the theological sciences. The great school of the Scotists takes its name from John Duns Scotus (see SCOTUS), a Franciscan friar, and it has been the pride of this order to maintain his distinctive doctrines both in philosophy and in theology against the rival school of the Thomists, to which the Dominican order gave its allegiance. See THOMISTS. In the Nominalistic controversy, the Thomists were for the most part Conceptualists; the Franciscans adhered to the rigid Realism. See NOMINALISM. In the Free-will question, the Franciscans strenuously resisted the Thomist doctrine of 'predetermining decrees.' Indeed, all the greatest names of the early Scotist school are the Franciscans, St Bonaventure, Alexander de Hales, and Ockham. The single name of Roger Bacon, the marvel of medieval letters, the divine, the philosopher, the linguist, the experimentalist, the practical mechanician, would in itself have sufficed to make the reputation of his order, had his contemporaries not failed to appreciate his merit. Two centuries later, the great Cardinal Ximenes was a member of this order. The Popes Nicholas IV., Alexander V., Sextus IV., the still more celebrated Sixtus V., and the well-known Ganganelli, Clement XIV., also belonged to the institute of St Francis. In history, this order is less distinguished; but its own annalist, Luke Wadding, an Irish Franciscan, bears a deservedly high reputation as a historian. In lighter literature, and particularly poetry, we have already named the founder himself as a sacred poet. Jacopone da Todi, a Franciscan, is one of the most characteristic of the medieval hymn-writers; and in later times, the celebrated Lope de Vega closed his eventful career as a member of the third order of St Francis. We may add that in the revival of art the Franciscan order bore an active and, it must be confessed, a liberal and enlightened part. See Wadding, *Annales Minorum Fratrum*, 8 vols.; see also Milman's *Latin Christianity*, vol. v.

FRANCISCO, San. See San Francisco.

FRA'NCKÉ, Aug. Herm., a distinguished German philanthropist, founder of the Orphan Asylum and several educational institutions at Halle, was born at Lubeck in 1663. Having studied languages and theology with great application and success, he first attracted attention by his academical biblical lectures in Leipsic, begun about 1685. These were more distinguished for piety, warmth, and zeal, than for attention to the strict and dry orthodoxy then in vogue; and the reception they met with from the public brought on F. envy and persecution as a heretic. He thought proper to yield to the storm, and withdrew in 1690 to Erfurt. In 1692, he obtained the professorship of Oriental languages in the newly instituted university at Halle, where he subsequently held a professorship of theology. He also received the pastoral charge of the suburb of Glaucha. The ignorance and poverty of his parishioners gave the first impulse to his benevolent labours. To the neglected poor and children that came to him for alms, he gave instruction on stated days, and as others joined, paying a school-fee of a penny a week, and the numbers rose to some sixty, he divided them into classes, and thus laid the first foundation of his educational establishments. At the same time the thought suggested itself of an orphan asylum, and in 1698 he laid the foundation of a special building for the asylum. Some years after, he erected a Pedagogium, a Latin school, and a boarding establishment connected with it. In 1714, there were 1075 boys and 700 girls receiving instruction from 108 teachers under the direction of Francke. He also had a missionary institution for the East Indies. To erect and maintain all these establishments required large sums of money; and it is surprising how F. succeeded in obtaining it without assistance from government. But so high was his reputation for disinterested benevolence, and in such a practical way did he set about his undertakings, never appealing for the charitable aid of others till he had first effected something himself, that contributions flowed in from all parts of Germany, and even from abroad. F. also instituted an apothecary's shop and bookselling in connection with his other operations, and thus obtained a considerable income for their support. Nor amidst all these voluntary labours did he neglect his duties as professor and pastor; he preached and lectured regularly, and also found time to study and write. He died June 8, 1727.

Francke's Institution, as it now exists in Halle, embraces the orphan house and schools erected by F., together with others since added; the number of pupils amounting in all to upwards of 3500. Bookselling, printing, and a laboratory for the preparation and distribution of medicines are also carried on in connection with education. The revenues consist of the profits of this industry, of the income from some property in land and funds, and of an allowance of £6000 from the state. The education imparted retains its religious character, but the excessive number of prayers and the otherwise conventual and ascetic character of the discipline have been diminished.

FRANÇOIS, St, is the name of two towns in the French West Indies.—1. St F. in Guadeloupe stands on the Grande Terre, the more easterly of the islands into which the colony is divided by an of the sea known as Salt River. It contains a 6600 inhabitants, about 5600 of them having slaves down to 1848, the epoch of emancip under the French Republic.—2. St F. in Martin possesses a good harbour on the east coast. population of 5966, 4272 had been slaves.

seem to have taken a prominent
of moment. In 987, Crescenzio
ally vindicated the prerogatives
e against the encroachments of
XV. The rivalry of the F. House with
Pietro Leoni, not only occasioned
l wars in the state, but likewise several schisms in the church. The lustre of their race was finally outshone by the two great patrician families, Colonna and Orsini, whose magnificence, power, and pretension far exceeded those of the greatest citizens of Rome. Two of the last of the F. who merit mention are Giovanni, who captured Conradin of Hohenstaufen, and delivered him, in 1268, to his sanguinary enemies; and Latino, Grand Inquisitor and Cardinal and Bishop of Ostia and Velletri. The origin of the name Frangipani is attributed to the family's benevolent distribution of bread in time of famine.—The Croatian family of the same name claim descent from the great original Roman House.

FRANK, FRANKING LETTERS. On the introduction of the uniform penny-postage on all inland letters in 1840 (3 and 4 Vict. c. 96), the privilege formerly enjoyed by peers and members of the House of Commons, and many official persons, of '*franking*,' as it was called, that is, sending and receiving letters duty free, was abolished; the statute 7 Will. IV. and 1 Vict. c. 32, by which this privilege had been recently regulated, being repealed by s. 68 of the first-mentioned act. The privilege was claimed by the House of Commons in 1660, when the post-office was first legally established (see POST-OFFICE), but it was afterwards dropped upon a private assurance from the crown that it should be allowed to members. The postmaster-general accordingly constantly issued a warrant directing the allowance, till the privilege was expressly conferred by statute 4 Geo. III. c. 24. In the days of franking, each member of either House of Parliament was entitled to send ten letters every day, not exceeding an ounce in weight each, to any place in the United Kingdom, and to receive fifteen, free. As it was not necessary that the letter should be either written by or to the privileged person, the privilege was greatly abused; and most persons whose memories reach back to the period when it existed, will remember family arrangements for taking advantage of it, by which the whole correspondence of the kindred, connections, and even the intimate acquaintances of a peer, or a member of parliament, was in general carried on duty free. Up to the passing of the last-mentioned statute (12th July 1837), all that was requisite was that the member should write his name or title on the corner of the letter. From this time, however, till the abolition of the privilege, it was required that the whole address should be written by the member; that he should add not only his name, but the name of the post-town, and the day of the month; and what was most troublesome of all, that the letter should be posted on the day on which it was written, or the following day, and in a post-town within 20 miles of which the person franking was then actually resident. By this cruel regulation (7 Will. IV. and 1 Vict. c. 35, s. 9), the kindly custom of giving franks to friends, or leaving them with them for future use, was rudely interfered with, and the public mind reconciled to the final abolition of what many regarded as a time-honoured abuse.

FRANKALMOIGNE (Lat. *libera eleemosyna*, free alms) was a gift of lands to those who were consecrated to the service of God. By the ancient common law of England, a man could not alien lands which came to him by descent without consent of his heir, but he might give a part to God in free alms. It was an old Saxon tenure, and continued under the Norman revolution, through the great respect that was shewn to religion and religious men. This is the tenure by which almost all the ancient monasteries and religious houses held their lands, and by which the parochial clergy and

ny supposed to have been obtained from
Lycia, which is now believed not to
uch product, and is a native of the south
, whilst the prized frankincense of the
was brought from the East.—Several trees,
of different natural orders, yield substances used as frankincense instead of olibanum, in different parts of the world, as several species of *Icica* and of *Croton* in America; and the silver fir (see FIR) in Europe, the resinous product of which is the COMMON FRANKINCENSE of the pharmacopœias, although in the shops, concrete American turpentine is very often sold under this name. It is used in the composition of stimulating plasters, &c. *Burgundy pitch* is made from it. It is a spontaneous exudation from the tree, hardening by exposure to the air, and generally of a whitish or pinkish colour, with a rather agreeable odour and a balsamic taste.

FRANKLIN. The franklin, or, according to the old spelling, the frankelein, was the English freeholder of former times, who held his lands of the crown, free (frank) from any feudal servitude to a subject-superior. Chaucer's *Franklin's Tale*, and still more his description of the franklin in the prologue to his immortal Pilgrimage, have rendered him a classical character. In the whole circle of our literature there is probably no more perfect picture of the person, habits, and surroundings of a jovial old country gentleman. His beard was white as a daisy, his complexion sanguine, he loved a 'sop in wine,' and woe to his cook if his sauce were not poignant and sharp; in a word, 'he was Epicurus' owen son.' But the franklin's luxuries were not intended for his own enjoyment alone, for 'a householder, and that a great, was he.' His table stood 'in his hall alway,' 'ready covered all the longe day;' and

> Withouten baked meat never was his house,
> Of fish and flesh, and that so plenteous,
> *It snowed in his house of meat and drink.*

Nor was it only in dispensing good cheer that the franklin fulfilled the functions of the country gentleman of his day. At sessions, he was 'lord and sire,' and full often time he had been 'knight of the shire.' He had been sheriff too, and a countour and vavasour; though what these latter offices were, is a subject of controversy amongst the commentators. 'The dress of the franklin, according to the Duke of Sutherland's MS.,' says Mr Saunders, in his excellent little book called *Cabinet Pictures of English Life* (p. 204), was a surcoat of red lined with blue, with bars or stripes of fringe or lace over it. He wore a small blue hat turned up, and black boots.' Chaucer adds to his attire a knife or dagger called an 'anelace,' and a 'gipciere' or silk purse, 'white as morrow [morning] milk,' at his girdle. Mr Saunders mentions (*ut sup.*) that in the Metrical Chronicle of Robert de Brune, the franklin of an earlier period (13th c.) is ranked immediately after earls, barons, and lords, and was evidently a person of great consideration. Such, as we have seen, was very much his position in Chaucer's time, but he seems to have fallen in dignity, and we find him in much lower company in Shakspeare's day. In *The Winter's Tale* the clown is made to say (Act v. scene 2):

> Not swear it, now I am a gentleman
> Let boors and franklins say it, I 'll swear it.

From other passages it would seem that his position had come to correspond to that of the well-to-do yeoman. In 1 Henry IV., Act ii. scene 1, we hear of a franklin 'in the wold of Kent hath brought three hundred marks with him in gold;' and *Cymbeline* says (Act iii. scene 2), 'Provide me presently a riding suit, no costlier than is fit a franklin's housewife.' There seems no reason to think, however, that Dr Johnson's remark that franklin is 'not improperly Englished a gentleman servant,' is warranted by his position at any period, and it certainly is not by the passage which he quotes from the *Fairy Queen*:

> A spacious court they see, &c.,
> Where them does meet a franklin fair and free.

FRANKLIN, BENJAMIN, a distinguished American statesman and natural philosopher, was born at Boston, January 17, 1706. His parents were poor, and had a family of seventeen children, he being the fifteenth. Josiah Franklin, his father, had left England in 1685, and settled in America, where he followed the business of soap-boiler and tallow-chandler. At the age of eight, F. was sent to school, where he displayed great aptitude for learning. At twelve, he was apprenticed to his step-brother James, who had set up a printing-shop in the place, and he soon acquired considerable proficiency at that trade. He was passionately fond of reading, and all the time he could spare, he devoted to the perusal of such books as he could lay his hands on. He early attempted poetry, and when, in 1720, his brother started a newspaper, he contributed a number of anonymous articles to it; but on the fact being discovered, his brother treated him very harshly. After one of the frequent quarrels with his brother he determined to quit him; and accordingly, without the knowledge of his family, he left Boston and proceeded to New York; but not finding employment there, he went next to Philadelphia, where he succeeded in procuring a situation in a printer's shop. Here he attracted the attention of Sir William Keith, the governor of Pennsylvania, who advised him to set up a printing-establishment of his own. Following this good advice, he set out for England, with a view to obtain the necessary plant. Finding himself, however, deceived in his expectations of assistance from Keith, and having no resources of his own, he was compelled to take employment in London, where he resided for about a year. On his way back to Philadelphia in 1726 he made the acquaintance of a merchant named Denham, who gave him the situation of book-keeper in his office; but Denham dying soon after, F. went back to his old trade, and with the assistance of some friends set up a business for himself. In 1730 he married a Miss Read, with whom he had become acquainted previous to his visit to England. Matters now prospered with F.; he became the proprietor and [illegible] which attained [illegible] and projected in 1732 [illegible] in which appeared the [illegible] maxims afterwards published under [illegible] and translated into [illegible]. Through the instrumentality of [illegible] was founded in 1742 the first [illegible]. He also founded an [illegible] association for extinguishing fires, [illegible] insurance [illegible] he contributed [illegible] progress of the city of his [illegible] which he [illegible] to the general [illegible] 1736 [illegible] Philadelphia [illegible] he was appointed [illegible] he discovered the identity of electricity with lightning, and turned his discovery to account by publishing a plan for defending houses from lightning by the use of pointed conductors. He likewise made important discoveries with regard to the laws that regulate the electric fluid, a subject hitherto very imperfectly understood. His renown was spread over the whole civilised world, and honours were heaped upon him by the various learned societies of Europe. The Godfrey Coley gold medal was bestowed upon him by the Royal Society of London, which also nominated him one of its members. The universities of Oxford, St Andrews, and Edinburgh respectively conferred upon him the degree of D.C.L. He was made an associate of the Academy of Sciences at Paris, as Leibnitz and Newton had been before him.

During his residence in England he became intimate with some of the most distinguished men both of Britain and of the continent; his correspondence with them indicates the combination in a remarkable degree of a cultivated mind with a vivid imagination. In 1762 he returned to America; but new difficulties arising between the mother country and the colonies, which determined the Assembly to demand the establishment of a central government, he was again despatched to England as its agent. He strongly opposed the stamp act, and was examined at the bar of the House of Commons in 1766, when the repeal of that offensive measure was proposed. In consequence of the position he assumed on this occasion, he was deprived of the postmastership, and treated very harshly by the ministry. Despairing of bringing about any reconciliation between the disputants, he returned to Philadelphia in 1775, where the Congress was at that time assembled. He was elected a delegate to it; and from that time he exerted himself to the utmost to obtain a declaration of the independence of the thirteen American states. This declaration was pronounced by Congress on the 4th July 1776, and F. was appointed United States minister at the court of France, where he succeeded in inducing the French government to form an offensive and defensive alliance with the States. On the 30th of January 1783 F. had the supreme satisfaction of signing at Paris, along with the English commissioners, the treaty of peace by which the independence of the American colonies was assured. Returning to America in 1785 he was successively chosen member and president of the supreme executive council for the city of Philadelphia, and in 1787 delegate for Pennsylvania to the convention for the revision and emendation of the Articles of Union. In 1788 he retired from public life, and died April 17, 1790, at the advanced age of 84. The Congress, as a testimony of the gratitude of the thirteen states, and of their sorrow for his loss, appointed a general mourning throughout the States for the period of two months.

F. in all his labours was ever actuated by an intense desire to promote the well-being and happiness of his fellow-men; and few have been more successful in their aims. From poverty he rose to wealth and from ignorance and obscurity to extensive erudition and honourable renown, gaining for himself the admiration of Europe and the gratitude of America.

In person, F. was about 5 feet 9 or 10 inches in height, and well and strongly made. He had a fair complexion and gray eyes, while his manners were extremely winning and affable. None of his descendants bears his name. The last who did so being his grandson, William Temple Franklin, who died in 1823. There are many descendants of his daughter, who married a Mr Bache.

The works of F. appeared in London in [illegible] irs and posthumous works were published andson, W. T. Franklin, under the title *s and Writings of Benjamin Franklin* A complete edition of his works was pub- Jared Sparks in 12 vols. (new edition, best life of F. is by Bigelow (1874).

LIN, Rear-admiral Sir John, an naval officer of distinguished reputation, at Spilsby, in Lincolnshire, April 16, 1786. s descended from a long line of freeholders, was the youngest son of a respectable yeoman. received the rudiments of his education at St ; afterwards he spent two years at the gram- school of Louth. It is stated that he was ded for the church, but as he displayed a predilection for the sea, his father wisely sed opposition to his choice of a profession. cured him, in 1800, a midshipman's post on *Polyphemus* line-of-battle ship. In the year, F.'s ship led the van in the desperate Copenhagen. Two months after, he was d to the *Investigator*, then fitting out under of Captain Flinders, for discovery and Australian coast. In this expedition, companionship of the distinguished Brown, and of his coadjutor Ferdi- r, and from them he learned the great of the natural sciences, in the promotion he ever afterwards took a deep and interest. On his return to England, appointed to the *Bellerophon*, in which as signal midshipman in the battle of (1805), and had the good-fortune to nhurt. He subsequently served in the on various stations, and took a distin- art in the attack on New Orleans in 1814. F. was despatched by government to Hud- , with orders to make his way thence to s Sea, and survey as much of the coast . In the course of this expedition, which out three years and a half, F. travelled under circumstances of the greatest privation, to which more than half nions succumbed. But the gain to at, alike from the carefulness and physical surveys of the mouth of River, and eastward along Corona- from the attention devoted to the tions of these inclement shores. On , F. was made post-captain, and ow of the Royal Society. In 1825, ted (overland) with the sea-expeditions Parry and Beechey, and surveyed the rican coast from the mouth of the westward to about Point Beechey. F.'s now extended over 44 degrees of longi- than a third of the distance between and Behring's Strait. For these valu- s, in which he was engaged until ed the honour of knighthood from and the degree of D.C.L. from the Oxford, while the French Geographical d him their gold medal, and at a iod he was elected corresponding Institute of France. F. next took in the Greek war of liberation. In appointed governor of Van Diemen's his e and moderate conduct secured approbation both of the govern- onists. The latter established a philosophical society in his honour; r, they testified that the memory of still gratefully cherished, by sub- £1600 towards an expedition designed for . In May 1845, F., now bordering on his years, but with physical and mental powers undiminished in vigour, started with the *Erebus* and *Terror* on his last and ill-fated expedition to discover the North-west Passage. The last time that the vessels were seen was in July of the same year. To enter into the history of the efforts undertaken for the relief or discovery of the fate of F. would be out of place here. It is sufficient to say, that in the course of eleven years upwards of twenty separate expeditions, at the cost of about a million sterling, were sent out to look for the missing crews; and the discoveries of these expeditions added more to our knowledge of the arctic regions than all previous explorations had done. See North-west Passage. It was not until 1859 that the fate of F. was ascertained by the commander of a little vessel fitted out by Lady Franklin, after hope had been declared hopeless by all else. It then appeared that F. had died on the 11th June 1847, fortunately before his sympathetic heart had been lacerated by witnessing the awful sufferings of his men. F. was one of the boldest and most persevering explorers that Britain ever sent from her shores. His daring was qualified by judgment, and his sense of duty and responsibility as to the lives of those under his charge was of the keenest. His heart was tender as a woman's; and altogether he was one of the noblest types of a true Christian gentleman.

FRANKLIN, Jane, Lady, the second wife of Sir John F., to whose unwearied energy, devotion, and hopefulness, when hope had sunk in all other hearts, we are indebted for the knowledge of the fate of her gallant husband, is the daughter of John Griffen, Esq., of Bedford Place, London, and was married to Sir John Franklin in November 1828. In 1848, when, owing to the long absence of news about the expedition of the *Erebus* and *Terror*, fears began to be entertained about its safety, Lady F. offered large rewards to any persons who should discover and afford relief to the missing voyagers, or who would make exertions with that end in view. From that time until 1857, when she fitted out the *Fox*, under the command of M'Clintock, whose discoveries set all doubts about the fate of her husband's expedition at rest, Lady F. never rested in her efforts to incite by voice, pen, and purse, not only her own countrymen, but Americans, to search for the missing ships and their unfortunate crews.

FRANKMARRIAGE (*liberum maritagium*) was a species of estate tail existing by the common law of England; for where a man, on the marriage of his daughter or cousin, gave lands to be held in frankmarriage, this implied a gift in special tail, to the donees and heirs of their bodies. This tenure was called *liberum maritagium*, to distinguish it from other species of estates tail (*Co. Litt.* 94 b). Four things were necessary to a gift in frankmarriage: 1. That it must be in consideration of a marriage, but it might be as well after as before a marriage. 2. That the donee with whom it is given be of the blood of the donor. 3. That the donees should hold of the donor. Hence a gift in frankmarriage by a subject became impossible after the statute of *Quia emptores*. 4. That the donees should hold for four generations. Therefore a gift in frankmarriage with a reservation of a remainder to a stranger, or a devise by will, was bad.

FRANK-PLEDGE, a law prevailing in England before the Norman Conquest, whereby the members of every tything were responsible for the good-conduct of each other. This responsibility, according to Mr Hallam, consisted in every ten men in a village being answerable each for the others, so that if one committed an offence, the other nine were liable for his appearance to make reparation. Should the offender abscond, the tything, if unable to clear themselves from participation in the crime, were compelled to make good the penalty. This law has been ascribed to Alfred the Great; but it would appear to have been in existence at a much earlier period. Mr Hallam, *Middle Ages*, ii. p. 80 (edit. 1841), observes: 'The peculiar system of frank-pledges seems to have passed through the following very gradual stages. At first, an accused person was bound to find bail for standing his trial. At a subsequent period, his relations were called upon to become securities for payment of the compensation and other fines to which he was liable; they were even subject to be imprisoned until payment was made, and this imprisonment was commutable for a certain sum in money. The next usage was to make people already convicted, or of suspicious repute, give securities for their good-behaviour. It is not till the reign of Edgar that we find the first general law, which places every man in the condition of the guilty or suspected, and compels him to find a surety who shall be responsible for his appearance when judicially summoned. This is perpetually repeated and enforced in later statutes during his reign and that of Ethelred. Finally, the laws of Canute declare the necessity of belonging to some hundred and tything, as well as of providing sureties.'

The *Court of Frank-pledge*, or *Court-leet*, is a court of record held once in the year, and not oftener, within a particular hundred, lordship, or manor, before the steward of the leet: being the king's court granted by charter to the lords of those hundreds or manors. All freeholders resident in the jurisdiction are bound to attend this court; but persons under twelve and over sixty years of age are excused, and by the statute of Marlbridge, 52 Hen. III. c. 10, all prelates, peers, and clergymen, and women are discharged from attendance. It was also the custom to summon all the king's subjects to this court, on attaining years of discretion, to take the oath of allegiance. The business of this court was to present by jury all crimes committed within their jurisdiction, and to punish all trivial misdemeanours. This court has practically fallen into desuetude, and the business is discharged by the justices of the peace at general and petty sessions. See Blackstone's *Commentaries*. Originally, the business of the court of frank-pledge was confined to the taking securities or free pledges for every person within the jurisdiction; but this practice having fallen into disuse, the court gradually acquired a criminal jurisdiction, concurrent with that of the sheriff's tourn. '*Magna Charta* distinguishes between the tourns or leets of sheriffs and the view of frank-pledge; limiting the former to twice a year, and the latter to once. In the more ordinary sense, frank-pledge and leet are synonymous, as appears from the style of tourns and other leets, which in court-rolls are usually denominated *curiæ* or *visus franci plegii*. But when free pledge is used, as in Magna Charta, it should be understood in a strict and particular sense.'—*Co. Litt.* by Hargrave, 115 a, note 10.

FRANKS (i.e., freemen) was the name assumed by a confederation of German tribes that appeared on the Lower Rhine in the 3d c., and afterwards overthrew the Roman dominion in Gaul. It was only the name, however, that was new; the individual tribes composing the confederation had been known on the Rhine as early as the time of Augustus. The most important of these were the Sigambri, Chamavi, Ampsivarii, Chatti, Chattuarii, and Bructeri of the time of the first emperors. In the 3d and 4th centuries, hordes of them began to pour through the Low Countries into Gaul, until at last the country became their prey. After the middle of the 4th c., they appear divided into two groups, the Salians—either from the old Ger. *Sal*, or the river Sala (*Yssel*)—and the Ripuarians (*ripa*, the bank), the first inhabiting Holland and the Low Countries, the last on both sides of the Rhine as far up as the Main. Each group had its own laws, afterwards committed to writing (*Lex Salica* and *Lex Ripuariorum*). Like the two peoples, these laws differ little even in detail. The F. were a mobile, well-endowed race, forming in language and art the transition from the Low Germans to the High; and they compose to this day the ground of the population of the west of Germany as far as the Neckar, Main, Murg, and Lower Alsace, as well as the chief Germanic element of the population of Northern France. For the later history of the Franks, see articles CLOVIS, CARLOVINGIANS, CHARLEMAGNE, FRANCE, MEROVINGIANS, &c.

FRA'NZENSBRUNN, or **FRANZENSBAD**, a small village and well-known bathing-place in Austria, on the north-western frontier of Bohemia, three miles north-west of Eger, is situated amid low bare hills, and consists of four rectangular streets lined with trees. It has four cold mineral springs, chiefly of alkalo-saline chalybeate water, deemed highly efficacious in the cure of scrofulous complaints and diseases of the skin, and used principally for drinking, but also for bathing purposes, in which case the water is heated to a temperature of 90° to 98° F. Nearly 200,000 bottles of these waters are exported annually. F. has also mud and gas baths.

FRASCA'TI, a beautiful town about eight miles east-south-east of Rome, with a population of 5000. It stands on the lower heights of the Alban Hills, not far from the site of ancient Tusculum, which was built on a higher range of hills. Tusculum (q. v.), a town of much more ancient date than Rome, was burned and ruined by the Romans in 1191 A.D., to avenge a former victory gained by the Tusculans in 1167. Those of the inhabitants who escaped the fury of the conquerors, sought refuge on the slope of the hill towards Rome, constructing small huts out of the underwood or *frasche*, and hence the modern name Frascati. The chief attractions of F. are its lovely villas and salubrious air, which attract from Rome in the hot season all its noble and foreign residents, and render this resort in the Alban Hills the most fashionable *villeggiatura* in the vicinity of the Eternal City. The most splendid of these summer residences are the villas Aldobrandini, also known as Il Belvedere, from its commanding and noble prospect; those of Mondragon and Taverna of the Borghese family; the villas Pallavicini and Piccolomini.

The cathedral contains a tablet to the Cardinal of York, for many years bishop of this diocese, and another to his brother, Charles Edward, the Young Pretender, who died here in 1788.

FRASER, SIMON. See LOVAT, LORD.

FRASER RIVER, the principal stream of British Columbia, comprises in its basin the far greater part of the colony. The F. R. proper has its origin in the union of two branches, the more important of which receives its waters from a series of lakes that lie in lat. 54°—55° N., long. about 124° 50′ W., flows in a general south-east direction for 260 miles, and then unites with the other branch, which has its source near Mount Brown, in the Rocky Mountains, lat. 53° N., long. 118° 40′ W., flows north-west, and is 200 miles in length. The point of confluence is near Fort George, in lat. about 53° 25′ N., and in long. about 122° 40′ W., and hence the F. R. flows in a generally southern direction through nearly the

and clean, with substantial houses. Pop. in 1871, 4252, annually increased by 1200 during the herring-fishing in July and August. It is possessed of one of the best harbours on the east coast, which has lately been greatly extended, and has a patent slip attached to it. The chief exports are oats, barley, meal, potatoes, cured herrings, and cod. F. is now one of the most successful herring fishing stations on the east coast of Scotland, the average number of boats being between 500 and 600. Since 1865, it is connected with Aberdeen by railway. F. has a handsome cross and town-house in the principal square, and a spacious hall belonging to the Harbour Commissioners. Sir Alexander Fraser, in 1592, obtained a charter for the establishment of a college and university here, but the plan was never carried out.

FRASIER, a strawberry flower, is used by Scotch heraldic writers as synonymous with a cinquefoil; as in blazoning the coat of the Frasers, *Azure three frases* (Nisbet, i. p. 388).

FRATE'RCULA. See PUFFIN.

FRATICE'LLIANS, or **FRATICELLI** ('Little Brethren'), a sect of the middle ages, which may be regarded as an embodiment, outside of the medieval church, of the same spirit to which is due, within the church, the Franciscan order with its many offshoots. The Italian word *Fraticelli* originally was the popular name of the Franciscan monks; but, in the progress of the disputes which arose in the order (see FRANCISCANS), the name was specially attached to the members of the rigorist party, and eventually to those among them who pertinaciously refused to accept the pontifical explanations of the monastic rule, and, in the end, threw off all subjection to the authority of the church. Several of the popes, especially Gregory IX. and Nicholas III., attempted to reconcile the disputants. Pope Celestine V. granted permission to the rigorists to form for themselves a separate organisation, in which the rule of St Francis might be observed in all its primitive and literal rigour. The suppression of this order by Boniface VIII. appears to have furnished the direct occasion for the secession of the extreme party from the church. They openly resisted the authority of the pope, whom they proclaimed an apostate from the faith. The party thus formed was increased by adhesions from other sectarian bodies, as the 'Beghards' and the 'Brethren of the Free Spirit' (see FREE SPIRIT). In vain Clement V., in the council of Vienna (1311—1312), put forward a new declaration regarding the rule of St Francis. They still held their ground, especially in Sicily, Central and Northern Italy, and Provence. John XXII., against whom they sided actively with Lewis of Bavaria, condemned them by a special bull in 1317, and again in a similar document directed against Henry de Ceva, one of their chief leaders in Sicily. From these sources we learn that they regarded the existing church as in a state of apostasy, and claimed for their own community the exclusive title of the Church of God. They forbade oaths, and discountenanced marriage. They professed a divine mission for the restoration of the Gospel truth. They held that all spiritual authority was forfeited by sin on the part of the minister. It would even appear that they proceeded so far as to elect for themselves a pope, with a college of cardinals, and a regular hierarchy (Wadding, *Annal. Min. Fratrum ad an.* 1374, n. 20). Their principles, in a word, seem to have partaken largely of the same fanatical and anti-social tendencies which characterised the Brethren of the Free Spirit; and in common with them, the F. were the object of a rigorous persecution about the middle of the 14th century. The principles of this sect formed the subject of a public discussion at Perugia in 1374 between them and a Franciscan monk named Paolucci, which appears to have ended in their discomfiture. They still maintained themselves, nevertheless, in Central Italy, down to the 15th c., when John de Capistran received a commission to labour for their conversion in the March of Ancona; but before the beginning of the following century, they seem to have disappeared altogether. See Mosheim, *De Beghardis et Beguinabus* (Lipsiæ, 1790); Milman's *Latin Christianity*, vol. v.; Witsix's *Kirchen-Lexicon.*

FRA'TTA-MAGGIO'RE, a town of Italy, six miles north-east of the city of Naples, has extensive rope-works, and furnishes great quantities of strawberries for the market of the capital. Silk-worms are here reared in great quantities. Pop. about 11,000.

FRAUD. By the laws of all civilised nations fraud invalidates obligations. In order to produce this effect, however, it is necessary that the misrepresentations, or other dishonest manœuvres of the offending party, shall have induced the other to enter into the agreement or contract, and that he would not otherwise have consented. Fraud of this description on the one side produces *error in essentialibus* on the other, and where such error exists there is no consent. But as consent is of the essence of the contract, there is here no contract at all; i. e., the contract, or pretended contract, is, as lawyers say, null *ab initio.* It is not necessary that the fraud which thus gives birth to the contract shall have consisted in positive misrepresentation, or even in studied concealment; and it was well laid down in the case of an English sale, that where the purchaser laboured under a deception, in which the seller permitted him to remain, on a point which he knew to be material in enabling him to form his judgment, the contract was void. But there is another kind of fraud which, though it be not actually the cause of, is incident to, the contract, and which, though it does not annul the contract, gives rise to an action for damages or restitution by the party deceived. The distinction between these two kinds of fraud was well known to the civilians, the first species being described by them as that 'quod causam dedit contractui,' that is to say, which causes the contract; the second as that 'quod tantum in contractum incidit,' which is incident to, or accompanies the contract, but independently of which the contract would have been entered into (Voet. lib. 4, tit. 3, 3). There is another very important element to be taken into account in judging of the character, and determining the legal effects of a fraud, viz., whether it proceeded from one whose position was such as to impose upon him the obligation of making the discovery. In illustration of this principle, the following case was put by Lord Thurlow in Fox *v.* Mackreth (2 Bro. Ch. R. 420): 'Suppose that A, knowing there to be a mine on the estate of B, of which he knew B was ignorant, should enter into a contract to purchase the estate of B for the price of the estate, without considering the mine, could the court set it aside? Why not, since B was not apprised of the mine, and A was? Because A, as the buyer, was not obliged, from the nature of the contract, to make the discovery. . . . . The court will not correct a contract merely because a man of nice honour would not have entered into it; it must fall within some definition of fraud. The rule must be drawn so as not to affect the general transactions of mankind.' Neither will the commendations usually bestowed on their commodities by tradesmen be regarded as fraudulent statements, so long as they are simply extravagant in degree; but if positively at variance with facts known to them, they will not be permitted to enjoy the protection which custom has extended to ordinary 'puffing.' The same principle will yield the converse result: wherever a relation of peculiar confidentiality exists between the contracting parties. Here courts of law require what is called *uberrima fides*, the fullest measure of good faith, to validate the transaction. As an illustration, may be mentioned a case in which the managing partner of a firm purchased the share of his co-partner for a sum which he knew from the accounts, of which he had the entire superintendence, to be inadequate, but the inadequacy of which he concealed. The transaction was reduced, Sir John Leach, V. C., remarking that 'the defendant being the partner whose business it was to keep the accounts of the concern, could not, in fairness, deal with the plaintiff for his share of the profits of the concern without putting him in possession of all the information which he himself had with respect to the state of the accounts between them.'—Maddeford *v.* Austwick 1 Gim. R. 89.

In addition to direct misrepresentation, and concealment in circumstances in which open dealing was a duty, fraud may be perpetrated by taking advantage of the imbecility of the party who has been led into the contract, and still more flagrantly by inducing this imbecility by intoxication or otherwise. See Concealment, Error, Misrepresentation, Contract. In addition to the ordinary English sources of information, we may refer to the extensive and learned *Traité du Dol et de la Fraude*, par J. Bédarride, 3 vols. (Paris, 1852).

FRAUNHOFER, Joseph von, a distinguished practical optician, was born at Straubing, in Bavaria, 6th March 1787. In 1799 he was apprenticed to a glass-cutter in Munich, and in 1806 was received, as a working optician, into the establishment of Reichenbach and Utschneider at Benedictbeurn (afterwards, in 1819, removed to Munich). While there, he acquired considerable wealth through his inventions, and soon afterwards became proprietor of the establishment. He invented a machine for polishing parabolic surfaces, and was the first who succeeded in polishing l[illegible] and mirrors without altering their curvature. [illegible] prisms also were celebrated, being free from [illegible] blebs and striæ which are so often seen in those of English manufacture. His inventions are numerous, and include a 'heliometer,' a 'micrometer,' an 'achromatic microscope,' besides the great parallactic telescope at Dorpat. But that which has rendered F.'s name celebrated throughout the scientific world, is his discovery of the lines i[illegible] Spectrum. He died at Munich on the 7th of [illegible] 1826.

FRAU'NHOFER'S LINES. See Spectrum.

FRAU'STADT (Polish, Wssowa), a town of Prussia, in the government of Posen, is situated in a sandy plain on the Silesian frontier, 55 miles north-west of Breslau. It has linen, woollen, and other manufactures, and important grain markets. In the vicinity are about 100 wind-mills. Pop. (1871) 6515.

FRAXINE'LLA. See Dittany.

FRA'XINUS. See Ash.

CK (Ger. FRIEDRICH) I., OF GER-
k I., Emperor of Germany, sur-
SSA (Redbeard), was born in 1121,
father, Frederick Hohenstaufen, as
in 1147, and his uncle, Conrad III.,
1152. He was one of the most
and powerful rulers who ever swayed
l sceptre. In his desire to emulate
, and to raise the secular power of the
opposition to the arrogated supremacy
al chair, he was brought into constant
ith his Italian subjects. Six times he
lled to cross the Alps at the head of
s, in order to chastise the refractory
mbardy, which were ever ready, on the
rovocation, to throw off their allegiance.
ly periods of his reign, he visited their
ith undue severity; but in his latter
nduct towards them was characterised
ous leniency and a politic liberality in
his age; and in 1183, he convoked a
Constance, in which he finally agreed to
ombard cities the right to choose their
ipal rulers, and to conclude treaties and
ng themselves, although he retained his
over them, together with the power
certain fixed taxes. The difficulty of
Italian differences was as usual aggra-
's time by the attitude assumed by the
f the papal chair, and at one time Italy
ted by the pretensions of two rival popes,
III. and Victor IV., who each excom-
the other, and hurled the anathemas
ch against their several opponents; and
till 1176 that F., after his defeat at
consenting to acknowledge Urban II.,
r of Alexander III., as the rightful pope,
l to turn his attention to Germany. By
asures, he succeeded in thoroughly
oublesome vassal, Henry the Lion,
wick, and thus crushing the Guelfic
any. F. made Poland tributary
raised Bohemia to the rank of a
the markgrafdom of Austria into
hereditary duchy. In 1189, F.,
affairs of the empire, and pro-
peace in his dominions, resigned
to his eldest son Henry, and,
000 men, set forth for the Holy
ed by his second son, Frederick
founder of the order of Teutonic
gaining two great victories over

of learning, and enacted many
some of which are still in force.

CK II., OF GERMANY, grandson of
son of the Emperor Henry VI., and
s of Sicily, was born in 1194.
the favour of Pope Innocent
on, by conceding many import-
the papal chair; and after the
had raged in Germany for eight
rival claimants of the throne,
and Otho IV., was brought to
cy of Innocent, F. succeeded (1212) in obtaining the support of the German electors. On his promising to undertake a crusade, the pope sanctioned his coronation at Aix-la-Chapelle in 1215. Like his grandfather, F. was actuated by an ardent desire for the consolidation of the imperial power in Italy at the expense of the pontificate, which he wished to reduce to the rank of a mere archiepiscopal dignity. Having secured the nomination of his son Henry to the rank of king of the Romans, and appointed Archbishop Engelbert of Cologne as his vicegerent, he left Germany; and after having been crowned emperor at Rome in 1220, devoted himself to the task of organising his Italian territories. He founded the university of Naples, gave encouragement to the medical school of Salerno, invited to his court and patronised men of learning, poets, and artists, and commissioned his chancellor, Petrus de Vineis, to draw up a code of laws, to suit all classes of his German and Italian subjects. F.'s schemes for the union of his vast and widely scattered dominions were, however, frustrated by the refractory conduct of the Lombard cities, and still more by the arrogance of the popes Honorius III. and Gregory IX., who threatened him with excommunication unless he fulfilled his pledge of leading a crusade. Being compelled to depart on this expedition, he made the necessary preparations for its prosecution; but a pestilence having broken out among his troops in the Morea, he returned in haste to Italy, only to be again forced away by papal threats. This second attempted crusade proved more successful; and in 1228, notwithstanding the machinations of the pope, and the treachery of the Knights Templars, F. extorted a ten years' truce from the Moslem ruler, and forced him to give up Jerusalem and the territory around Joppa and Nazareth. The rest of his life was spent in bringing his rebellious Lombard subjects to subjection, and in counteracting the intrigues of the pope, the rebellion of his eldest son, and the treachery of his friend and minister, the Chancellor Petrus de Vineis, who was suspected of attempting to poison him. F., who died suddenly in 1251, the possessor of seven crowns, was the most accomplished sovereign of the middle ages, for he not only spoke and wrote the six languages common to his subjects, but he was famed for his talents as a minnesinger, and for his skill in all knightly exercises, while he wrote elaborate treatises on natural history and philosophy. His strong sympathies with his Italian mother-land, and his unremitting endeavours to establish a compact and all-supreme empire in Italy, were the causes, not only of his own misfortunes, but of the miseries which he brought upon the German empire, by embroiling him in costly wars abroad, and leading him to neglect the welfare, and sacrifice the interests of his German subjects. See for Frederick I. and Frederick II., Raumer, *Geschichte der Hohenstaufen*; Sismondi, *Italian Republics*, and *Europe in the Middle Ages*; Voigt's *Lombardenbund*; Funk, *Geschichte Kaiser Friedrich II.*

FREDERICK III., OF GERMANY. Frederick who was F. III. as Emperor of Germany, F. IV. as King of Germany, and F. V. as Duke of Austria, was born in 1415, being the son of Duke Ernst, of the Styrian branch of the house of Hapsburg. At the age of 20, he undertook an expedition to the Holy Land; and on his return, in conjunction with his factious brother, Albert the Prodigal, he assumed the government of his hereditary dominions of the Duchy of Austria, the revenues of which scarcely exceeded 16,000 marks. On the death of the Emperor Albert II., he was unanimously elected as his successor; and two years afterwards, in 1442, he was solemnly crowned at Aix-la-Chapelle; ten years later, he received the imperial crown at the hands of the pope at Rome, and in 1453 secured the archducal title to his family. His reign was a prolonged struggle against domestic intrigues and foreign aggressions. One of his most troublesome opponents was his brother Albert, who refused to give up the provinces which he held until he had received a large sum of money; but notwithstanding these causes of annoyance, and while John Hunyades Corvinus, at the head of a Hungarian army, overran Austria, and laid siege to Vienna, and the usurper Sforza possessed himself of the imperial fief of Milan, on the extinction of the male line of the Visconti, F. remained absorbed in his own private studies, or roused himself only to attempt, by the aid of foreign mercenaries, to recover the crown-lands of which the House of Austria had been deprived. His pusillanimous subserviency to the papal chair, and his wavering policy, irritated the electors, who at one time cherished the design of deposing him and nominating George Podiebrand, king of Bohemia, to the imperial throne; while it entangled him in quarrels on account of the succession to the Palatinate, and other questions of German policy, and deprived the church in Germany of that independence from the thraldom of the papal chair which it had been the object of the Council of Basel to secure to it. The contempt in which F. was held was made apparent on the death of his ward, Ladislaus, king of Hungary and Bohemia, without children, when, notwithstanding his just pretensions to this inheritance, he was passed over, the people of the former having chosen George Podiebrand as their king, and those of the latter Matthias Corvinus. His brother Albert's death in 1463 secured him a short reprieve from internal disturbances, and gave him possession of Upper Austria; but he was repeatedly embroiled in quarrels with Podiebrand and Matthias; the latter of whom several times besieged Vienna, and finally dispossessed him of every town of importance in his hereditary domains. In the meanwhile, the Turks were suffered to push their conquests in Europe until they had advanced in 1456 to Hungary, in 1469 to Carniola, and in 1475 to Salzburg, although a vigorous opposition at the outset would easily have put a definite stop to their encroachments. On the death of Matthias, in 1490, F. recovered Austria, but he was obliged to acknowledge Prince Ladislaus of Bohemia as king of Hungary. This mortification was soon followed by his death, in 1493, after an inglorious reign of 53 years, which did nothing to advance the prosperity or progress of the empire, although the times were propitious to both. But although F. neglected the interests and duties of the imperial crown to indulge in the pursuit of his favourite studies in alchemy, astronomy, and botany, he never lost an opportunity of promoting the aggrandisement of his own family, which he very materially secured by marrying his son and successor, Maximilian, to Mary, the rich heiress of Charles the Bold of Burgundy. F. was temperate, devout, parsimonious, scrupulous about trifles, simple in his habits, pacific in his disposition, and naturally averse to exertion or excitement. From his time, the imperial dignity continued almost hereditary in the House of Austria, which has perpetuated the use of his favourite device, A. E. I. O. U., *Austriæ Est Imperare Orbi Universo*. See Æneas Sylvius, *Historia*; Coxe, *House of Austria*.

FREDERICK V., Prince Palatine.—Frederick V., Electoral Prince Palatine, was born in 1596, succeeded to the Palatinate in 1610, was king of Bohemia from 1619 to 1620, and died in 1632. He
married, in 1613, Elizabeth, the daughter
VI. of Scotland and I. of England, throu
ambitious counsels he was induced to tal
minent part in the proceedings of the
the Protestant princes of Germany, an
although against his own inclinations, to a
title of king of Bohemia. His complete
the battle of Prague terminated his al
enjoyment of the regal crown, of which he
no other memorial but the mocking title
Winter King.' Ridicule and contumely
him wherever he went, and the rest of hi
spent in exile under the ban of the em
with no resources beyond those which
obtain from the generosity of his friends.
he was declared to have forfeited his elect
and his dominions in the Palatinate, wh
conferred upon his cousin, Maximilian of
the head of the Catholic league.

FREDERICK I., of Denmark, was
1473, and died in 1533. During the
reign of his nephew, Christian II., he beh
so much circumspection, that the choic
nation fell upon him when the king was
and he was raised to the throne in 15
shewed great cruelty to his unfortunate
whom he detained in close captivity; but
a politic ruler. In 1527 he embraced the
faith, which he established in his d
the most arbitrary measures.

FREDERICK III., of Denmark, th
Christian IV., was born in 1609, succeede
throne in 1648, and died in 1670. The wa
father's reign had brought the country to
of great embarrassment; and notwithstan
his efforts to maintain peace, F. was con
embroiled in the quarrels of other natio
during his reign Copenhagen was twice besi
the Swedes under their warlike king,
Gustavus; nor was peace re-established t
the death of Charles. The reign of F.
rendered memorable by the change effecte
constitution, which, after having been i
degree elective, was at once changed a
tary and absolute monarchy by the v
the commons and clergy, who, from a
the nobility, surrendered to the crown t
and prerogative which they had hitherto
and made the sovereign absolute and irrespo

t of the Austrians in 1809, the duke
leave Germany; and with his corps
hussars,' and 800 infantry, he began
treat. After various skirmishes, in
he defeated the Westphalian com-
rode and a picked detachment of
Brunswick, in the neighbourhood
ined a victory at Oelper over 4000
manded by General Reupel. He
ser, and having reached Elsfleth,
and taken possession of a sufficient number of vessels and seamen, he embarked his troops; and finally, after stopping at Heligoland, landed in England with his men in August 1809. He was received with enthusiasm; and having entered the English service with his men, subsequently took part in the Peninsular war, where he served with distinction, receiving from the British government an allowance of £6000 a year, which he retained till his return to his own dominions in 1813. Although no prince could be more earnestly bent on securing the welfare of his subjects, his efforts failed utterly from the untimely and injudicious nature of the reforms he endeavoured to effect; while the magnitude of his military establishments, which were quite unsuited to the limited extent of his territories, excited the ill-will of his people. He joined the allied army with his hussars after the return of Napoleon from Elba, and fell gloriously while leading on his men at Quatre Bras, on the 16th of June 1815.

FREDERICK-WILLIAM, ELECTOR OF BRANDENBURG, commonly called 'the Great Elector,' was born in 1620, succeeded to the electorate in 1640, and died in 1688. On his accession, he found an empty exchequer, the towns and cities depopulated, and the whole electorate devastated by the ravages of the Swedish and Imperialist armies during the Thirty Years' War, which was not yet concluded; while a portion of his inheritance had even been confiscated by the Swedes. His first acts were to regulate the finances, and to conclude a treaty of neutrality with Sweden, which left him at leisure to devote himself to the organisation of his army, and the re-peopling of the deserted towns and villages by means of immigration. By the treaty of Westphalia, through which he lost several important places, he recovered the eastern portions of Pomerania, Hohenstein, the bishoprics of Halberstadt, Minden, and Kamin, as lay-principalities, and the reversion of the archbishopric of Magdeburg. In the course of ten years he had, by the help of his generals, Derfflinger, Schomberg, and Kannenberg, created an army of 25,000 men, organised on the Swedish model; and having been constrained to enter into an alliance with Charles X., he co-operated with him in the taking of Warsaw, which was effected at the cost of a most sanguinary engagement in 1656. In return for this co-operation, F.-W. secured the emancipation of his Prussian duchy from its former dependence on Poland. The aggressions of Louis XIV. on the Rhenish frontier alarmed the elector, who induced the emperor, the king of Denmark, and the Elector of Hesse-Cassel, to enter into a league against France. The result was unfavourable to the cause of the German princes, and F.-W. was obliged to content himself with making highly disadvantageous terms. The war was soon renewed, and Brandenburg was again a prey to the incursions of the Swedes, who, at the instigation of Louis, advanced upon Berlin, laying waste everything on their march. The elector, who had taken up his winter-quarters in Franconia, hurried across the Elbe at the head of his cavalry, and having signally defeated the Swedes, drove them from his dominions. If the emperor had been true to his word, and supported him, F.-W. might have made head against the French; but being forsaken by the other German princes, and his dominions overrun by the troops of Louis, he was obliged to agree to the treaty of St Germain, by which he restored all his conquests to the Swedes, in return for the withdrawal of the French army, and the payment to him of an indemnity of 300,000 crowns. From this time forth, F.-W. devoted himself to the task of consolidating the prosperity of his dominions.

During his reign, he more than tripled the area of his territories, and by his generous reception of 20,000 French Protestants after the revocation of the Edict of Nantes, and the encouragement which he afforded to the immigration of Dutchmen and other foreigners, he augmented the population of his states, and introduced numerous industrial arts among his subjects. He founded the university at Duisburg, and the royal library at Berlin, and reorganised the universities of Frankfurt-on-the-Oder, and Königsberg, opened canals, established a system of posts, and greatly enlarged and beautified Berlin. He left a well-filled exchequer and a highly organised army. See Orlich, *Gesch. des Preuss. Staats im* 17 *Jahrh.* Berl. 1839.

FREDERICK III., ELECTOR OF BRANDENBURG, son and successor of the former, and the first king of Prussia, was born in 1657, and succeeded to the electorate of Brandenburg in 1688. He exhibited the same zeal as his father for the aggrandisement and amelioration of his dominions; but he was distinguished from him by his admiration of Louis XIV., whose pomp and luxurious display he imitated at his own court. He supported William of Orange in his attempt on England, and gave him a subsidy of 6000 men, which, under the command of Marshal Schomberg, contributed to gain the victory at the Boyne which decided the fate of James II. F. was always ready to lend troops and money to his allies; he sent 6000 of his best men to aid the Imperialists against the Turks; and although he met with the same ingratitude as his father, he succeeded, by treaties, exchanges, and purchases, in very considerably extending his territories; and after many years' negotiations, he induced the emperor to agree to the 'Crown Treaty,' by which, in return for permission to assume the title of King of Prussia, he bound himself to furnish certain contingents of men and money to the Imperial government. As soon as this treaty had been signed, F. hastened in mid-winter with all his family and court to Königsberg, where, on the 18th January 1701, he placed the crown on his own head. He died February 25, 1713. F. did much to embellish Berlin, where he founded the Royal Academy of Sciences, and the Academy of Painting and Sculpture, erected several churches, and laid out numerous streets. He established a court of appeal at Berlin, built the palace of Charlottenburg, and founded the university at Halle; but his actions were generally influenced by a love of display; and his vanity, together with his neglect of those who had served him, made him personally unpopular, although his patriotic love of Germany redeemed, in the eyes of his countrymen, many of his bad points.

FREDERICK-WILLIAM I., OF PRUSSIA, born in 1688, was in almost every particular the opposite of his father Frederick I. He was simple, and almost penurious in his habits, attentive to business, passionately fond of military exercises, but averse to mental cultivation, and fond of the society of the low and illiterate, while he carried to the utmost his ideas of arbitrary power and the divine right of kings. The public events of his reign were of little importance, although he was continually implicated in foreign wars, and he supported the cause of Stanislaus of Poland, and assisted Austria in her contests with France. He died in 1740. By his economy and reforms in the finances, he was able to indulge his taste for the organisation of military forces, while his childish love of tall soldiers induced him to connive at the most flagrant outrages both at home and abroad for kidnapping tall men and forcing them into his service: the result of this system was, that he left at his death a well-drilled
army of 70,000 soldiers, of whom a large pr
were men of gigantic stature. What was
consequence to his son and successor was, t
exchequer contained 9,000,000 thalers, an
his kingdom had attained an area of mo
45,000 square miles, and a population of u
of 2,240,000. See Morgenstern, *Ueber F
Wilhelm I.* (Braunsch. 1793); F. Förster,

LLIAM II., OF PRUSSIA, was
ued in 1797. After a prolonged
ween his uncle and himself, he
d-will of the king by his valour
Bavarian succession in 1778; but
eded to a well-consolidated power
treasury, he had not the capacity
rable position. Futile or hastily
wasted his resources; so that at his
overplus of 70,000,000 thalers
bequeathed to him, the state was
debt of 22,000,000. His predilec-
favourites, the establishment of a
ship of the press, and the introduction
ecclesiastic enactments, alienated the
the people from him, although his
ss of disposition had excited the san-
of the nation on his accession. F.-W.
shared in the second partition of Poland in 1793, and thus gained a considerable addition to his kingdom, which, by purchase, inheritance, and other means, was augmented during his reign by the acquisition of more than 46,000 square miles of territory, and 2½ millions of inhabitants. The chief internal improvements in this reign were the introduction of a new code of laws, and a less onerous mode of raising the taxes.

FREDERICK-WILLIAM III., OF PRUSSIA, the son of Frederick-William II., was born in 1770. He early took part in the administration, and, on his accession in 1797, he at once dismissed the unworthy favourites of the preceding reign, and accompanied by his beautiful young queen, Louisa of Mecklenburg-Strelitz, made a tour of inspection through the numerous provinces of his kingdom, with a view of investigating their condition, and contributing to their local and general improvement. But although F.-W. was well intentioned, and in his moral and domestic relations his conduct was exemplary, he lacked the dignity and force of will to cope with the difficulties of his position. By his efforts to maintain an attitude of neutrality in the great European struggle that had been excited by the wars and victories of the French, he awakened the distrust of all the great anti-Gallican powers of Europe, and disappointed the petty German princes, who had looked upon Prussia as their protectress against foreign encroachments. Napoleon's promises of support and friendly intentions soon changed this neutrality to an alliance with France, and for some time Prussia persevered in her dishonourable and self-seeking policy, which was rewarded by the acquisition of Hildesheim, Paderborn, and Münster, which added nearly 4000 square miles of territory, and half a million of inhabitants to the kingdom; but at length the repeated and systematic insults of Napoleon, who despised F.-W. while he professed to treat him as a friend, roused the spirit of the nation, and the king saw himself obliged, in 1805, to agree to a convention with Russia, the real object of which was to drive Napoleon out of Germany. Again the treachery of Prussia led her to make a new treaty with France, by which she consented to receive the electorate of Hanover, and thus involved herself in a war with England. The insults of Napoleon were redoubled after this fresh proof of F.-W.'s indecision. The Prussian nation, headed by the queen, now called loudly for war, and at the close of 1806, the king yielded to these appeals. Hostilities began without further delay; but the defeat of the Prussians at Jena, Eylau, and Friedland, compelled their unfortunate monarch to sue for peace. The Prussian army was annihilated, and the whole of the kingdom, with the exception of a few fortified places, remained in the power of the French. By the intervention of the Emperor Alexander of Russia, a peace was concluded, known as the Treaty of Tilsit, by which F.-W. lost the greater part of his realm, and was deprived of all but the semblance of royalty; but although for the next five years he was a mere tool in the hands of Napoleon, who seized every opportunity of humbling and irritating him, his spirit was not subdued, and his unremitting efforts at this period of his life to reorganise his enfeebled government by self-sacrifices of every kind, endeared him greatly to his people. The disastrous termination of Napoleon's Russian campaign was the turning-point in the fortunes of Prussia; for although the French emperor was victorious over the Prussians and Russians in the battles of Lutzen and Bautzen, which were fought soon after the declaration of war which F.-W. had made against France, to the great joy of his people, in 1813, the allies were soon able to renew hostilities, which were carried on with signal success, until they finally culminated in the great battle of Leipsic, in which the Prussians, under their general, Blücher, earned the greatest share of glory. The Peace of Vienna restored to Prussia almost all her former possessions, while the part taken by the Prussian army under Blücher in gaining the victory of Waterloo, by which Napoleon's power was finally broken, raised the kingdom from its abasement. From that time, F.-W. devoted himself to the improvement of his exhausted states; but although before the French revolution of 1830 Prussia had recovered her old position in regard to material prosperity at home and political consideration abroad, the king adhered too strictly to the old German ideas of absolutism, to grant his people more than the smallest possible amount of political liberty. He had indeed promised to establish a representative constitution for the whole kingdom, but this promise he wholly repudiated when reminded of it, and merely established the *Landstände*, or Provincial Estates, a local institution, devoid of all effective power. His support of the Russian government in its sanguinary methods of crushing revolutionary tendencies in Poland, shewed his absolute tendencies, and his dread of liberal principles. F.-W. was more than once embroiled with the pope, on account of his violation of the concordat. He concluded the great German commercial league known as the *Zollverein* (see GERMANY), which organised the German customs and duties in accordance with one uniform system. He died in 1840.

FREDERICK-WILLIAM IV., OF PRUSSIA, son of the foregoing, was born October 15, 1795. He had been carefully educated, was fond of the society of learned men, and was a liberal patron of art and literature. He exhibited much of his father's vacillation and instability of purpose; and although he began his reign (June 7, 1840) by granting minor reforms, and promising radical changes of a liberal character, he always, on one plea or other, evaded the fulfilment of these pledges. He was possessed by high but vague ideas of 'the Christian state,' and shewed through life a strong tendency to mystic pietism. The one idea to which he adhered with constancy was that of a union of all Germany into one great body, of which he offered himself to be the guide and head. He encouraged the duchies of Holstein and Slesvig in their insurrectionary movement, and sent troops to assist them against Denmark; but he soon abandoned their cause, and being displeased with the revolutionary character of the Frankfurt Diet, refused to accept the imperial crown which it offered him. The conspiracies in Prussian Poland were suppressed with much rigour; and the popular movement which followed the French revolution of 1848, was at first met by the king with resolute opposition; but when the people persisted in demanding the removal of the troops from the capital, and enforced their demand by storming the arsenal, and seizing on the palace of the Prince of Prussia (the present king), who was at that time especially obnoxious to the liberals, he was obliged to comply with their wishes. Constituent assemblies were convoked, only to be dissolved when the king recovered his former security of power, and new constitutions were framed and sworn to, and finally modified or withdrawn. After the complete termination of the revolution in Germany, the revolutionary members of the Assembly of 1848 were prosecuted and treated with severity, the obnoxious 'pietistic' party and the nobility were reinstated in their former influence at court, and the freedom of the press and of religious and political opinion, was strictly circumscribed. The life of the king was twice attempted; first in 1847 by a dismissed burgomaster, named Tschech; and secondly, in 1850, by an insane discharged soldier of the name of Sefeloge. In 1857, F.-W. was seized with remittent attacks of insanity; and in 1858 he resigned the management of public affairs to his brother and next heir, who acted as regent of the kingdom till his own accession, in 1860, as William I. F.-W. died in 1861.

FREDERICTON, the capital of the province of New Brunswick, in the Dominion of Canada, stands on the right bank of the St John, the largest river in the province. It is 56 miles to the north-west of the principal seaport, which bears the name of the stream above mentioned, and it is itself accessible to vessels of 50 tons. The population is about 6000. In addition to the public buildings, which F. possesses as the seat of government, it contains the university of New Brunswick, which is well endowed, and has a good staff of professors.

FREDERIKSHALD, a fortified seaport of Norway, in the department (amt) of Smalenen, stands on an inlet called Swinesund, near the Swedish border, about 60 miles south-south-east of Christiania. It is beautifully situated, and is a neat, well-built town, with several handsome edifices. Its harbour is excellent; in it the largest vessels may be safely moored. F. largely exports deals and lobsters. Pop. 7408. To the south-east of the town stands the fortress of Frederiksteen, on a perpendicular rock 400 feet high. This fortress, though often assaulted, has never yet been taken. While laying siege to Frederiksteen, Charles XII. of Sweden was killed, 1718; in commemoration of which event an obelisk was raised, in 1814, upon the spot where he fell.

FREE BENCH (*Francus Bancus*). By custom of certain manors in England, a widow was entitled to dower out of the lands which were held by her husband in Socage (q. v.). In some places, the widow had the whole, or the half, and the like *dum sola et casta vixerit* (Co. Litt. 110, b). This right is called *francus bancus*, to distinguish it from other dowers, for that it cometh freely, without any act of the husband's or assignment of the heir (Co. Litt. 94, b). See DOWER. A widow who has forfeited her free bench is, by the custom of some manors, permitted to recover her right. At East and West Enborne, in the county of Berks, and also in the manor of Chadleworth, in the same county, and at Torr, in Devon, if the widow commit incontinency, she forfeits her estate; yet if she will come into the court of the manor riding backward on a black ram, with his tail in her hand, and will repeat certain verses (more remarkable for their plainness than their delicacy), the steward is bound by the custom to admit her to her free bench (Cowel's *Interpreter*, ed. 1727, fol.).

FREE CHURCH OF SCOTLAND, the name assumed by those who at the 'Disruption' of the Established Church of Scotland, in 1843, withdrew from connection with the state, and formed themselves into a distinct religious community, at the same time claiming to represent the historic church of Scotland, as maintaining the principles for which it has contended since the Reformation.

(It is proper to state that, in accordance with a method adopted in other cases also in this work, the present article is written by a member of the church to which it relates, and is an attempt to exhibit the view of its principles and position generally taken by those within its own pale.)

There is no difference between the F. C. of S. and

Church in the standards which they
ll the laws of the church existing
r to the Disruption, are acknow-
the one as much as in the
they may since have been

nts the exercise of church-dis-
to them as well as the ministry
sacraments. It ascribes to the
ch power and many duties con-
itual, but no power in or over
lves. And all this was equally
Church of Scotland before the
sion was compiled. The sup-
many parts of Europe, princes gave to
Reformation, and the circumstance
ll as churches were shaking off the
, led in many cases to a confounding
and the spiritual. The Church of
plished its emancipation from Rome,
co-operation of the civil power, but
sistance; and after the Reformation,
Reformers and their successors were
a closer study of their principles, by the
ttempts of the civil rulers to assume
r all the internal affairs of the church.
their struggles, the Presbyterians of
prevailed as to obtain at different
cts of parliament in recognition of
and 'ratification of the liberty of
and finally, after the Revolution of
1688, an act ratifying the Westminster Confession of Faith itself, and incorporating with the statute law of the realm all its statements concerning the province of church-judicatories and that of the civil magistrate, and the bounds of their respective powers.

The rights and privileges of the Presbyterian Church of Scotland, guaranteed by the Revolution settlement, were expressly secured by the Treaty of Union, and jealously reserved from the power of the British parliament; yet within five years afterwards, when Jacobite counsels prevailed in the court of Queen Anne, an act was passed for the restoration of patronage in Scotland, with the design of advancing the Jacobite interest by rendering ministers more dependent on the aristocracy, and less strenuous advocates of the most liberal principles then known. This act soon became the cause of strife within the Church of Scotland, and of separation from it; effects which have continually increased to the present day. How the church at first earnestly protested against the act; how this protest gradually became formal, and was at last relinquished; how the church-courts themselves became most active in carrying out the settlement of presentees, notwithstanding all opposition of congregations, are points to which it is enough here to allude. It is important, however, to observe that in all the enforcement of the rights given to patrons by the act of 1712, during the 18th c., and considerable part of the 19th, no direct invasion of the ecclesiastical province took place on the part of civil courts or of the civil power; the presentation by the patron was regarded as conveying a civil right at most to the benefice or emoluments only, whilst the church-courts proceeded without restraint in the induction of ministers; and in a few instances it happened that the benefice and the pastoral office were disconnected by the opposite decisions of the civil and ecclesiastical courts. And even the 'forced settlements,' in which the fullest effect was given by the church-courts to the will of patrons, were accomplished according to the ancient form, upon the *call* of the parishioners, inviting the presentee to be their minister, although the *call* was a mere form—in the words of Dr Chalmers, 'the expressed consent of a few, and these often the mere driblet of a parish.'

When the 'Moderate' party, long dominant in the General Assembly of the Church of Scotland, became again the minority in 1834, the accession of the 'Evangelical' party to power was at once signalised by an attempt to restore the *call* to efficacy. This was done by the famous *Veto Law*, by which it was declared 'that it is a fundamental law of this church that no pastor shall be intruded on any congregation contrary to the will of the people,' and enacted, in order to give effect to this principle, that a solemn dissent of a majority of male heads of families, members of the vacant congregation, and in full communion with the church, shall be deemed sufficient ground for the rejection of the presentee. The Veto Law thus determined rather how strong an expression of dissent by the parishioners should be requisite to invalidate a call, than how strong an expression of assent should be requisite to give it validity; a circumstance which was afterwards much turned to account in controversy; as if the *veto* were a new and unconstitutional principle introduced; although it was certainly adopted as the least extreme mode of giving effect to the old principle which the law declared.

The same General Assembly by which the Veto Act was passed, is memorable for the assertion of the constitutional principles and inherent powers of

[illegible]

the F. C. has [illegible] very [illegible] passed away.

In 1873 the number of ministerial charges in F. C. of S. was 903. There are also numer preaching stations, in which preaching is regul maintained, and their ordinances are administe under the care of presbyteries. Some of these continually being added to the list of minister charges. The whole sum raised for religious a educational purposes by the F. C. of S. up March 1873 (i.e. in about 30 years), has been ab £[illegible]295,316, or rather more than £400,000 a ye In this are included the sums devoted to t erection of churches, manses, schoolhouses, c leges, &c. The Sustentation Fund for the year e ing 15th May 1873 amounted to £136,773, 19s. the missionary and educational funds to £77 congregational funds to £147,719, 6s. 1d.

Since 1843 the history of the F. C. has be generally that of peaceful progress. It has be agitated by [illegible] respecting the administrat of the Sustentation Fund, colleges, &c., which [illegible] [illegible] interest [illegible] beyond its own pale. [illegible] was brought into litigation in the Court of Sess seeming to affect its fundamental principles. T minister of the F. C. at Cardross, in Dumbarto shire, having been suspended by the Gene Assembly of 1858, had recourse to the Court Session, on the alleged ground of irregularity [illegible] of the ecclesiastical judicatur

of Scotland led to negotiations with the
Presbyterian Church and the Reformed
Church, but gave rise to great dis-
the F. C. itself, from the unwillingness
of its members to modify or abate their
of the doctrine of the lawfulness of the
nt of the church by the state; and it
a disruption of the F. C. was impend-
873 the proposal of immediate union

FREE-LANCES were roving companies of knights and men-at-arms, who, after the Crusades had ceased to give them employment, wandered from state to state, selling their services to any lord who was willing to purchase their aid in the perpetual feuds of the middle ages. They played their most prominent part in Italy, where they were known as Condottieri (q. v.).

FREEMAN AND FREEDMAN. In the most general acceptation of these terms, the first implies one who has inherited the full privileges and immunities of citizenship: the second, one who has been delivered from the restraints of bondage, but who, usually, is not placed in a position of full social or even political equality with him who was born free. Though the words are Teutonic (being composed of *frei*, free; and *mann*, a man or human being), the distinction between them depends on the constitution of Roman society. The equivalent for freeman (*liber homo*), indeed, comprehended all classes of those who were not slaves; but the distinction here pointed out was preserved by the application of the term *ingenuus* to him who was born free (Gaius, i. 11), and of *libertinus* to him who, being born in servitude, was emancipated. For the further development of this subject, as regards the classical nations of antiquity, see SLAVERY, CITIZEN. As the organisation of Roman society survived the convulsions of the middle ages to a far greater extent in the towns (see MUNICIPALITY, MUNICIPAL CORPORATION) than in the landward districts, where the institutions of feudality almost entirely superseded it, it is in the borough and other municipal corporations of this country, and of continental Europe, that we still find *freemen*, or persons inheriting or acquiring by adoption, purchase, or apprenticeship, the rights of citizenship. See FREEMAN'S ROLL. But the idea of a freeman was by no means peculiar to the Roman or Romanised population of Europe; on the contrary, it belonged to the constitution of society in all the Indo-Germanic nations. Amongst those branches of them commonly known as Teutonic, it was generally based on the possession of some portion of the soil. In Anglo-Saxon England, the freemen were divided into Ceorls (q. v.) and Eorls (q. v.), or Thanes (q. v.). See CITIZEN.

FREEMAN'S ROLL. By 5 and 6 Will. IV. c. 76, commonly called the Municipal Corporations' Act, which placed the corporate towns, or, as they are denominated, the boroughs enumerated in the schedules A and B—i. e., nearly all the boroughs in England and Wales except London under one uniform constitution, a distinction is made (s. 2) between the Freeman's Roll and the Burgess Roll. Every person who, if the act had not passed, would, as a burgess or freeman, have enjoyed, or might have acquired, the right of voting in the election of members of parliament, is to be entitled to enjoy or acquire such right as heretofore. And it is further enacted (s. 5), that the town-clerk of each borough shall make out a list, to be called *the Freeman's Roll*, of all persons admitted burgesses or freemen, for the purpose of such reserved rights as aforesaid, as distinguished from the burgesses newly created by the act, and entitled to the rights which it newly confers; these last are to be entered on another roll, to be called the *Burgess Roll*. See BURGESS.

FREEMASON, FREEMASONRY. See MASON; MASONS, FREE.

FREE PORT (Ital. *porto franco*), is a harbour where the ships of all nations may enter on paying a moderate toll, and load and unload. Free ports form dépôts where goods are stored at first without paying duty; these goods may then be either re-shipped for export on paying a mere transit-duty, or they may pay the usual full customs of the country, and be admitted for home consumption. Free ports thus facilitate transit trade, and form, as it were, a foreign district within a state. See Warehousing System.

FREE-SPIRIT, Brethren of the, a fanatical sect of the middle ages, which was very generally (though sometimes secretly) diffused over Italy, France, and Germany, between the 13th and 15th centuries. They took their name from the 'freedom of spirit' which they claimed, in virtue of the words of St Paul (Romans, viii. 2, 14), maintaining that the true sons of God are exempt from subjection to the law. They appeared first in Alsace, in the early part of the 13th c., and attracted notice by their singular attire and their fanatical proceedings, traversing the country in troops, accompanied by women, with whom, under the name of sisters, they lived in the greatest familiarity. Their doctrine was a species of pantheistic mysticism, which they applied with fearless consistency to all the details of the moral obligations. They held, according to Mosheim, who has collected the original authorities, 'that all things emanate from God, and will revert back into Him; that rational souls are part of the Divine Being; that the whole universe is God; that a man, by turning his thoughts inward, is united inexplicably with the First Cause, and becomes one with Him; and that those who are so immersed in the vortex of the Deity attain to perfect freedom, and are divested not only of the lusts, but even of the instincts, of nature.' From these principles, they inferred that the free man, thus absorbed in God, is himself God, and a son of God, in the same sense in which Christ is called the Son of God; and that, as such, he is raised above all laws, human and divine; to such a degree that, according to some of them, 'the godlike man cannot sin, do what he may; either because the soul, being elevated and blended with the divine nature, is no longer affected by the actions of the body, or because the emotions of the soul, after such union, become in reality the acts and operations of God himself, and therefore, though apparently criminal, and contrary to the law, are really good and holy, because God is above all law!' These blasphemous and immoral principles, incredible as they may appear, are extracted by Mosheim, partly from the books of the sect, partly from the decrees of Henry, Archbishop of Cologne, by whom they were condemned. Principles such as these drew down upon the sect the arm of the state, as well as the censures of the church. No sect of the time suffered so much from the inquisition in the 14th century. They were regarded as offenders against public order and morality, as well as against the faith of the church. See Inquisition. After the first appearance of the sect in Alsace (1212), where its leader was a certain fanatic called Ortlieb (after whom the members are sometimes called Ortliebians), it spread into Thurgau and the Upper and Lower Rhine. During the latter part of that century, one of the leaders, named 'Meister Eckart,' had so large a following at Cologne, that the archbishop made his teachings the subject of a lengthened edict. The sect spread also in Swabia, where its members were confounded with the Beghards. In France, they were popularly known by the name 'Turlupins,' a word of uncertain etymology. We meet them in Bohemia in the beginning of the 15th c., and there is considerable similarity between their principles and those of the Adamites, who figure in Hussite history. From this date they are heard of no more.—See Mosheim, Soames's ed. ii. 582; also Gieseler's *Church History*, iii. 467, iv. 226.

FREE STATE, Orange. See Orange River Free State.

FREESTONE, any rock which admits of being *freely* cut and dressed by the builder. In Scotland, it is synonymous with sandstone. It has also been defined as any rock which works equally freely in every direction, having no tendency to split in one direction more than another. In this sense, limestone and even granite have been called freestones.

FREE-TOWN—a name of the same significance as the *Liberia* of American origin to the south of it—the capital of Sierra Leone, a British settlement on the west coast of Africa. It is situated on the left bank of the Sierra Leone river, about 5 miles from the sea, in lat. 8° 29′ N., and long. 13° 9′ W. Pop. about 16,000. The town is pleasantly situated, and its wide streets are prettily ornamented with rows of orange, lime, banana, or cocoa-nut trees. The temperature, as one may expect from the locality, is tolerably uniform, varying in opposite seasons between the averages of 77°·6 F. and 80°·9. Towards the interior, F. is enclosed by the mountain-chain from which the colony is designated, a position to which the proverbial insalubrity of the climate is partly owing. The population, exclusive of the authorities and the garrison, consists almost exclusively of liberated negroes.

FREE TRADE. This term, when used so late as twenty years ago, expressed a disputed proposition, and was the badge of a political party; it now expresses the most important and fundamental truth in political economy. From its simplicity, it affords to those who expect to make political economy an exact science, the hope that they have obtained at least one axiom. But it has in reality been established as the result of a double experience—the one being the failure of all deviations from it, the other the practical success of the principle during the short period in which it has been permitted to regulate the commerce of this country.

Trade consists in buying and selling. There is free trade when there is no interference with the natural course of buying and selling, if such interference be intended to improve or otherwise to influence trade. It is necessary to keep this distinction in view, because there are many laws not contrary to the spirit of free trade which interfere with buying and selling; for instance, in this country, it is unlawful to deal in slaves, because we do not acknowledge the right of one human being to be the owner of another; it is unlawful to sell intoxicating spirits without having obtained a licence, because the tax for the licence brings revenue to the Exchequer, and intoxicating liquors are a commodity which it is advisable to tax, in preference to the common necessaries of life, or even harmless luxuries. There are many of these last which cannot be sold into this country without paying customs duty, but this is for the purpose of revenue merely, not as a restraint on trade.

The many attempts made by governments to regulate trade for the purpose of benefiting the communities over which they ruled, may be divided into two great classes: the one prohibited the exportation of commodities, the other encouraged exportation, and prohibited or discouraged importation. The former was the old rule in this and in other countries. It was supposed that the wealth of the country depended on its retaining within itself certain productions of native growth or industry, and their removal out of the country was prohibited or restrained. Until a late period the exportation of machinery was prohibited; but was an exceptional remnant of the old prin

Although in this dispute there are certain points of real difference of opinion between the opposing parties, yet the problem has been unnecessarily encumbered with the unsuitable phraseology that has accidentally invested it. The notion of 'freedom' is intelligible when we speak of a free man as opposed to a Russian serf, or of a free press as opposed to censorship; but with reference to human actions generally, it has no particular relevancy. When a man, urged by hunger, eats the food that is before him, we recognise two separate facts, the one leading to the other: the first is a painful feeling or sensation, the other a series of movements by which food is conveyed to the system; the one fact we call the motive, the other the action, of the will following on the motive; but there is no propriety in describing this sequence as either free or not free. We may inquire into the greater or less certainty of the sequence—namely, whether a hungry man does always, as a matter of course, avail himself of the food presented to him, or whether one may be very hungry with the option of eating, and with no other motive operating to deter from the act, and yet not eat, thus shewing an absence of uniform connection between pain and the movements for alleviating it; this would be a *real* question, and would throw light on the actual constitution of the human will; the question of liberty and necessity does not present us so much with an intelligible question as with an artificial difficulty made by inapplicable phraseology. It would have been much the same to have disputed whether or not the will is rich, or noble, or royal, merely because the virtuous and right-minded man has sometimes been commended by those epithets being applied to him. The word 'necessity,' also, is ill chosen, in consequence of its great ambiguity; being applied sometimes to logical and mathematical implication, as when we say the whole is greater than its part; sometimes to the rigorous uniformity of physical laws, such as gravitation; and at other times to what is merely a high probability, as when we expect that a man of honourable and upright character will speak the truth on some given occasion. See NECESSITY.

If we cast aside these confusing phrases, and inquire what is the real matter of dispute, we shall find that there are intelligible differences of opinion in reference to the sequences of human volition. It may be maintained that our actions have the same uniformity as the successions of the physical world; and this view would be supported by a very wide induction of experience. It will be found that the whole of the complicated operations of society depend upon the certainty that men, in the same circumstances and under the same motives, will act in the same way. We allow for differences of individual character; but when once we have seen what any man is disposed to do in one instance, we take for granted that he will be similarly actuated when the identical circumstances are repeated. The whole of our trading operations are founded on the maxim that human beings prefer a greater to a smaller gain; and it has never been found that any portion of our race has taken a wayward fit, and contradicted itself on this point. We are prepared for exceptions to the rule, when other strong motives are present, but these are merely the intervention of a new force, not the suspension of the law that connects the other motive with its usual consequent. Nor is there anything degrading to human nature in this uniformity; while the opposite state of things would undermine all the securities of human life, and land us in a moral chaos. If human beings, who habitually dread pains and penalties, were suddenly, for no ulterior reason, to court hunger and cold, imprisonment and disgrace, it is obvious that there would be a speedy termination of man's career on the globe.

Still, the position thus contended for may be, and has been, called in question; or, at least certain exceptions to its universality may be put forward. We are able to comprehend the meaning of this counter-doctrine, even although we may find a difficulty in acceding to it. For example, Socrates drew a distinction between *human* and *divine* knowledge, intending by the one the departments of nature where strict law prevailed, and where by assiduous observation men might attain to certainty; such was the knowledge of the operative respecting his special craft, in which it was absurd to seek for any other source of insight than his own and other men's experience. But this did not include all knowledge. There was a department, the divine, reserved by the gods for their own special administration, and where they did not bind themselves to observe uniformity of dealing. This region included, according to Socrates, such great operations of the physical world, as the motions of the heavenly bodies, the phenomena of weather and season. To be enlightened on these, it was necessary to consult the gods by oracle and sacrifice. Now, applying this view to the case of the human will, it might be maintained that, in the greater number of instances, and in all matters of primary importance, such as self-preservation, the uniformity of human actions must be admitted; but still there may be some deep, subtle, and refined operations, where the same motives sometimes lead one way, sometimes another, the whole situation being in every other respect identical. But it lies with the supporters of this view to substantiate their exceptional cases in the midst of so much evident uniformity. As yet, nothing of the kind has ever been proved, and our only safe ground, philosophically, is what is our safe ground practically—namely, to abide by the doctrine of law in *all* human actions, on which we have not the smallest scruple as respects the preponderating mass of them.

The partisans of liberty, who take up the ground of opposition to uniform law as now expounded, not unfrequently express themselves to the following effect. Granting that the emotions of the mind have a uniform efficacy as motives, and that he that has a musical taste will be found on all occasions acting in conformity with it, still the emotions are not the whole of the mind. We have, in our mental composition, Feelings, and Intelligence, and Activity; but these do not make up our entire being. There is a something that all these inhere in, a substratum or support, which we call our 'self,' the 'ego,' or 'I,' and this abstract self is exempt from the conditions that attach to these attributes of self. This ultimate personality of every human being is free and independent, being exempt from the laws whereby our several feelings operate as motives to our ordinary actions. A self-determining power is supposed to reside here, even if excluded from the other mental adjuncts. It is considered unphilosophical and incorrect to resolve the whole of mind into feelings, actions, and intellect; these are mere attributes of an inexplicable something which each one is conscious of, and recognises as the essence or centre of the mental being, while they are merely properties or attributes. Granting the existence of this inner self, there is said to be sufficient scope for a properly free agency, without going the length of supposing that men are to contradict themselves in the everyday conduct of life.

Such a mode of stating the doctrine of liberty, however, is liable to the charge of logical confusion, not to speak of the difficulty of establishing the existence of the entity in question. If we were to
inquire into what constitutes the *essence*

If a glass ater be covered with a cloth, tly wet by the application of from the wet cloth will soon ature of the contents of the were moistened with alcohol cold would be proportionally of cold varying with the rapidity evaporation. Wine-coolers, or water-coolers, made of porous earthenware, act in the same manner as the cloth. They are soaked in, and saturated by water, which by its evaporation occasions cold. Coolers of this kind are common in most hot countries. On the ancient monuments of Egypt, a man is sometimes represented as fanning these vessels with a palm-leaf, to promote evaporation, and the Arabs in that country still practise this custom. (See REFRIGERATING-MACHINES, in SUPP.)

In some parts of India, where the dryness of the air allows a considerable evaporation to take place, ice is obtained in the following manner: 'Flat, shallow excavations, from one to two feet deep, are loosely lined with rice-straw, or some similar bad conductor of heat, and upon the surface of this layer are placed shallow pans of porous earthenware, filled with water to the depth of one or two inches. Radiation (see HEAT) rapidly reduces the temperature below the freezing-point, and ice is formed in thin crusts, which are removed as fast as they are produced, and stowed away in suitable ice-houses.'—Miller's *Elements of Chemistry*, 2d ed., vol. i. p. 220.

FREEZING-POINT. See THERMOMETER.

FREI'BERG, an ancient city of Germany, the centre of administration for the Saxon mines, is situated on the northern slope of the Erzgebirge mountains, on the left bank of the Münzbach, not far from its confluence with the Mulde, 20 miles south-west of Dresden. It owes its origin to its silver-mines, discovered about the year 1190. It is still surrounded by old walls and towers, and contains many interesting buildings and institutions, of which the principal are the town-house, dating from 1410, and the cathedral (1484–1512), two stately Gothic edifices, and the Berg-Academie, or School of Mines, founded in 1765, the most famous institution of the kind in Europe. At the Berg-Academie, instruction is given by professors in surveying, mining, the preparation of ores, geology, mineralogy, &c. It possesses lecture-rooms, a library, and mineralogical and geological collections; and has attached to it three separate laboratories, and an office for the sale of minerals. Humboldt, Werner, Jameson of Edinburgh, and many other eminent geologists and mineralogists, studied at this institution. There are, it is said, about 150 mines of silver, copper, lead, and cobalt around Freiberg. The manufactures consist principally of articles in imitation of gold and silver ware, of white-lead, gunpowder, iron and copper wares, &c. In the 17th c., it was a place of great wealth, and had a pop. of 40,000. The mines, however, have of late greatly fallen off, owing either to the richest veins being exhausted, or to the shafts being driven so deep that the water cannot be drained off from them. Pop. (1871) 21,673.

FREIBURG, or **FRIBOURG**, a canton of Switzerland, bounded on the N. and E. by Bern, and on the S. and W. by Vaud and the Lake of Neuchâtel. It has a superficies of 642 square miles, and, according to the census of 1870, a population amounting to 110,832 souls, of whom 93,951 were Catholics. More than two-thirds of the inhabitants are French; the remainder are Germans. The official language is French, but all the laws and decrees binding on the whole canton are published both in French and German. The surface of the country is hilly, the mountains in the south of the canton forming a continuation of the Bernese Alps, and rising in the highest points upwards of 7000 feet high. The principal rivers are the Saane or Sarine—which traverses almost the whole extent of the canton from its southern to its northern extremity—and the Broye. The country abounds in excellent meadows and rich pastures, upon which are reared the strongest horses and the best breed of cattle in the whole of Switzerland; indeed, the great part of the wealth of the canton consists in cows, sheep, goats, and horses, of which in proportion to its area there are great numbers. Dairy husbandry, and especially cheese-making, is pursued with great success; 40,000 cwt. of cheese are said to be made yearly. There are considerable manufactures of straw-plat, leather, cherry brandy, and tobacco. F. was received as a member of the Swiss confederation in 1481, and in 1848 a liberal constitution was established. It sends six members to the national council.

FREIBURG, or **FRIBOURG**, a town of Switzerland, capital of the canton of the same name, is situated on both banks of the Sarine, but chiefly on a hilly promontory formed by one of its windings, about 18 miles south-west of Bern. Seen from some distance, the town has a highly imposing and picturesque appearance. Houses climb to the top, and extend to the very edge of the precipice that overhangs the river, and in another portion of the town they form terraces, the roofs of one tier being on a level with the pavement of another; while the whole is surrounded by a long rising and falling line of embattled walls, with watch-towers and gateways of ancient fortifications which still exist in a perfect state. The banks of the Sarine are united by four bridges, one of them a suspension-bridge, 906 feet long, 23 feet wide, and 175 feet above the stream, the longest bridge of a single span in the world—about 300 feet longer than the Menai Bridge. Another suspension-bridge spans the gorge of Gotteron, and is about 700 feet long, and 317 feet above the valley beneath. The church of St Nicholas, a fine Gothic structure, has an organ built by a native of F., which has 7800 pipes, one of them 32 feet long, and is considered the finest toned instrument in Europe. This church has also the highest spire and finest set of bells in Switzerland. The other principal buildings are the Cantonal School (previous to 1848 the Jesuits' College), the most conspicuous building of the town; and the Lyceum. The inhabitants of the upper portion of the town speak French; in the lower portion, German is spoken. F. has few manufactures; the chief are woollens, hardware, leather, pottery, and tobacco. Pop. (1870) 10,904, of which only 500 are Protestants.

FREIBURG, a town of Germany, in the grand duchy of Baden, capital of the circle of the Upper Rhine, is the seat of an archbishop, and is situated on the Dreisam, on the western border of the Black Forest, 42 miles south-south-east from Strasburg. It is an open, well-built town; the walls and ditches with which it was formerly surrounded, have been converted into promenades and vineyards. The Minster or Cathedral of F. is one of the most beautiful and perfect specimens of Gothic architecture in Germany. It is cruciform, and built of red sandstone, was begun in 1122, and not thoroughly completed till 1513. It has a tower 367 feet high, remarkable for its elegance and lightness. In one of its chapels, the University Chapel, there are, among other pictures, a Nativity and an Adoration by Holbein, the latter considered one of his most successful pictures. The university of F. was founded in 1456; it has above 30 professors, and about 350 students. The Exchange (*Kaufhaus*) is a quaint Gothic structure of the 16th century. The chief manufactures are chicory, tobacco, paper, potash, &c. Pop. (1871) 24,600, of whom about 2500 are Protestants.

FREIGHT (a word having the same origin as 'fare'), the hire of a ship, or part of a ship, for the transport of merchandise; also the merchandise so
transported. The agreement for the
termed a Charter-party (q. v.).

If a merchant freight a whole ship, but n
fill it, the captain is not at liberty to c
cargo from other sources, without accou
merchant for any moneys received for
tional load. On the other hand, if the
covenant to freight a certain portion of a
bound to pay the sum agreed on for that
notwithstanding that his goods may fail t
so much space. If, in the charter-party, a
appointed for sailing, and either the merc
to have his goods ready for embarkation b
fixed, or the vessel be unprepared to sta
and weather permitting—the agreement
declared void by the aggrieved party, who
recover at law for any detriment cause
property in consequence of the delay. Th
charter-parties has been traced back as fa
reign of Henry III.

This contract, which in England, and gen
the commercial language of this country, i
freight, is more commonly spoken of by t
writers of Scotland as Affrightment, from the
affrètement (Bell's *Com.* i. p. 414), but the

f D an. It was originally a
lle, as afterwards colonised anew by Julius Cæsar, and called Forum Julii. It has remains of ancient Roman walls, and of a Roman circus and viaduct. The ancient harbour, at one time the most important Gallic port, and in which Augustus posted the fleet of 300 galleys which had been captured from Antony at Actium, has become silted up. Here, or rather at the new harbour of St Raphael, 1½ miles off, Napoleon landed on his return from Egypt in 1799, and embarked for Elba in 1814. Pop. (1872) 2705.

FREMONT, JOHN CHARLES, an eminent American traveller and explorer, son of a French emigrant gentleman and a Virginian lady, was born at Savannah, Georgia, January 21, 1813. He lost his father at the age of four years, and removed to Charleston with his mother, where, at the age of 15, he entered Charleston College. For two years, he taught mathematics on board the sloop-of-war *Natchez*, received his degree in 1835, and soon after passed a rigorous examination for the post of professor of mathematics in the navy, and was appointed to the frigate *Independence;* but resolving to quit the sea, he turned his attention to civil-engineering, and was employed in the Mississippi survey, and similar undertakings. In 1840, he received from President Van Buren a commission as second-lieutenant in the corps of Topographical Engineers, and was ordered to make an examination of the river Des Moines, upon the western frontier. In 1841, he married the daughter of Colonel Benton. He now proposed to penetrate the Rocky Mountains, and, his plans being approved of, he reached and explored the South Pass in 1842, with only a handful of men. He thus demonstrated the feasibility of an overland communication between the two sides of the continent, and discovered the route to California, since followed by thousands. During the whole of his journey, he made careful barometrical and astronomical observations, and noted attentively the geography, botany, and geology of the district. A lofty peak which he ascended, 13,750 feet above the sea, is now called Fremont's Peak. His report of the expedition was laid before Congress in the winter of 1842–1843, and attracted great attention both at home and abroad.

He immediately planned a second expedition more extensive than the first, and determined to survey the then unknown regions lying between the Rocky Mountains and the Pacific Ocean. He commenced his journey in May 1843, explored the Kansas River, crossed the South Pass, and, after 1700 miles of travelling, came, on September 6, in sight of the Great Salt Lake, of which very vague and erroneous notions were entertained. He advanced as far as Fort Vancouver, 90 miles from the mouth of the Columbia River, and then commenced his return. He selected a route leading to the Upper Colorado, through an almost unknown region, crossed by rugged mountain-ridges. He soon encountered deep snows, and found himself in a bare and desolate country, with the prospect before him of death from cold and hunger to his whole party. After suffering the greatest hardships, he determined to make for San Francisco instead of the United States, and when he could get no Indian to guide him across the snow-covered mountains which lay between him and the valleys of California, he boldly undertook the passage without a guide. He accomplished it in 40 days, reaching Sutter's Fort on the Sacramento, early in March, with his men almost reduced to skeletons, and only 33 out of 67 horses and mules remaining, and those so weak and thin that they could barely walk. He proceeded southward, along the Western range of the Sierra Nevada, crossed that range through a gap, entered the Great Basin, and reached Washington in

lemoirs and Letters: in the former branch of contemporary history, Cardinal Retz was perhaps the most successful of the host of writers who gained a reputation in this special department of literature; while Madame de Sévigné's letters are models of easy epistolary style, and afford a lively picture of the times. This age, in which, at anyrate, the *semblance* of religion had been respected, was followed by one of scepticism, infidelity, and philosophical speculations of the wildest kind. Four men of genius, Montesquieu, Voltaire, Rousseau, and Buffon, contributed, to a very great extent, by their writings, and the influence which they exerted on the minds of their contemporaries, in bringing about the Revolution. Montesquieu, by his philosophical dissertations on the laws and government of his country, taught the French to take more enlightened views of the rights and duties of different classes of society, and thus naturally roused the angry passions of the oppressed lower orders; while the passionate eloquence of Rousseau won a hearing for doctrines which were entirely subversive of moral obligations, and recognised no higher standard than human inclinations. Voltaire's versatility of powers, which were exercised with equal ease, and nearly equal success, on tragedy, satire, romance, poetry, history, and philosophy, enabled him, to the end of his long life, to maintain the supremacy over public opinion, which he had won in his youth. Buffon devoted himself to the study and description of nature, and his *Histoire Naturelle*, which inaugurated a new era in the literature of natural history, is a remarkable monument of the science and learning of that period. Diderot, and D'Alembert the geometer, founded the *Encyclopédie*, which, while it gave a lucid summary of numerous branches of human knowledge, was always hostile to religion. The Revolution, which had been materially accelerated, if not produced, by the inspirations of men of consummate intellect, was not favourable to literature. A period of almost complete intellectual torpor succeeded the active mental development that had characterised the preceding classic and philosophic periods. The Empire was scarcely more propitious to learning; but with the *Corinne* and *L'Allemagne* of Madame de Stael, and *Les Martyrs* of Chateaubriand, a reaction took place; and these productions of the new romantic school were soon followed by numerous others, either belonging to the same, or to the rival classical school. Among the host of young and original writers who now acquired reputation, we may instance, in poetry, dramatic art, and fiction, Victor Hugo, the greatest of living French poets, Alfred de Vigny, Frederic Soulie, and A. Dumas the elder, one of the most prolific of novel-writers, among whose most popular works are—*Les Trois Mousquetaires*, *Le Comte de Monte Christo*, *Le Collier de la Reine*, &c. He published ample reminiscences of his various travels and personal adventures in *Le Caucase*, *Voyage*, *Les Mémoires d'Horace*, *Mémoires de Garibaldi*, the successive volumes of his own *Memoires*, &c. The catalogue of his writings is scarcely conceivable for its extent, numbering, it is said, above 1200 volumes. Casimir Delavigne has attempted to combine the romantic and classical schools in his *Louis XI.*, *Les Enfants d'Edouard*, &c. George Sand (Madame Dudevant) is one of the most elegant writers of her country, and her works are models of style. Her *Indiana*, which appeared in 1832, inaugurated a new era of emotional novel-writing, and has had numerous imitators. Among her numerous works, the most popular are *Lélia*, *Mauprat*, *André*, *Consuelo*, and the numerous pieces which she more recently has written for the stage, such as *François le Champi*, *Marquis de Villemer*, &c. *Les Mystères de Paris*, and

noticing more particularly the various
claimed for fresco-painting, it is proper
describe the process. A cartoon or draw-
paper is first made of the subject. This must
ed with a correct outline, and the shading
t fully made out. The finished cartoon
r be of the same size as the intended
it may be done on a smaller scale; but, at
an *outline* of the same size as the fresco
necessary. When the finished cartoon is
size as the fresco, it is generally
k and white, with chalk or charcoal,
ntial to have also a careful study of the
lour, and this is in most cases done on
colours used are mostly earths or
ers will stand the action of lime:
d applied with pure water. The
painted on is the last or smooth coating
that is laid over the rough plaster-work
walls are prepared. This last coating,
or rather as much of it as the artist
on being able to cover in one day, is laid on immediately before he commences work. The surface is wet, but firm and smooth; the tracing is laid over the portion prepared, and the artist, with a point of hard wood or bone, goes over the lines of the tracing, and slightly indents them on the plaster. He then proceeds with his work, the finished cartoon and coloured sketch being hung or placed near him for his guidance. After his day's work is over, any portion of the plaster that has not been painted on, or that may remain beyond or at the edge of his work, is cut away; and next day, when the painter is ready to commence work, the plasterer is at hand, and joins closely another portion of plaster to the edge of the portion painted on the previous day, which, when cut, had been slightly sloped. The lime, in drying, throws out a kind of crystal surface, which protects the colour, and imparts a degree of clearness much superior to, and easily distinguishable from, that of a work in tempera or size paint. This process, although apparently simple, nevertheless requires great dexterity and certainty of hand; for the surface of the plaster is delicate, and must not be overworked, besides, the lime only imbibes a certain quantity of additional moisture in the form of liquid colours, after which it loses its crystallising quality, and the surface, or a portion of it, becomes what painters call rotten. Many frescoes are defective in this way. It is only after the lime has dried that such flaws are discovered; the proper plan, in such a case, is to cut away the defective portion, have fresh plaster laid on, and do the work over again. But the flaws are too often retouched with tempera or size colours; and though they may escape notice for a time, the parts touched will change or come off in the course of a few years. Another difficulty in fresco is, that the colours become much lighter after the plaster dries, and for this allowance must be made. However, by practice, the painter may soon get over this difficulty; and he can test the difference between the colour as wet and as dry, by putting a touch on a piece of umber he has generally at hand, which instantly dries the colour, and shews it as it will be when the lime has dried.

The pre-eminence claimed for fresco-painting is founded on 1. The quality it possesses of clearness and exhibiting colours in a pure and bright state. The surface not being dry and dull, as tempera or size colour, nor glossy like oil-paintings, is capable of being favourably viewed from any point. 2. Its durability many frescoes being painted on arcades or the cloisters of churches open on one side, some on the fronts of houses entirely exposed in the open air. 3. The skill and dexterity required in execution -retouching not being admissible, nor those various appliances of glazing over painting, &c., available in working with oil-colours; all which circumstances compel the fresco-painter to confine his energy more to the subject and design, than to the mechanical qualities so much sought after by painters in oil. The frescoes by M. Angelo in the Sistine Chapel, by Raphael in the stanze of the Vatican, and those in the cupola of the cathedral of Parma by Correggio, are pointed to by the advocates of this mode of art as settling the question.

But, on the other side, it may be said—1. Though a certain degree of clearness and purity of colour results from fresco, it is deficient in depth and richness. The absence of glossiness is no doubt an advantage in the case of mural-painting with reference to architectural decoration; but to a considerable extent this difficulty can be obviated in the case of painting in oil; and Delaroche's great picture of the Hemicycle in the Beaux Arts in Paris, which is in oil, is not objectionable on that ground at propo n of aqueous rocks are fr are occasion- of the Old period are freshwater also -House limestone in coal-field, Purbeck beds in the alden beds in the Chalk, and the other beds in the Eocene period.

A AND FRIGGA, though spoken of in logy as distinct, are originally one, associated with Freyr. Frigga, in the Ases (q. v.), is the supreme goddess, and one of the daughters of the giant presides over marriages. Freyja is Niord, sister of Freyr, and goddess is drawn on a car yoked with cats; to women go, and also the half of those that fall in battle, whence she is called Val-Freyja. In this last respect, she must be considered as signifying the Earth; but the earth is also represented by Frigga, the wife of Odin, and when Freyja seeks Odin, as Isis seeks her Osiris, this is Odin conceived as the Sun. The names also, Frigga and Freyja, are in signification almost alike, and the two are often confounded in mythology. The Anglo-Saxons and Lombards worshipped the wife of Odin as Frea. The name yet survives in *Friday*.

FREYR, the son of Niord, of the dynasty of the Vanagods, was adopted with his father among the Ases, who, when he got his first tooth, bestowed upon him the celestial castle Alfheim. He is the god of peace and fertility; dispenses rain and fertility; and to him prayers for a good harvest are addressed. His wife is Gerda, daughter of the giant Gymer. F. had seen her as he once ascended the lofty seat of Odin, Hlidskialf, from which everything on earth is seen. Gerda was so beautiful, that the brightness of her naked arms illuminated air and sea. Seized with violent love, F. sent Skirnir as spokesman, and for his services had to give him his good sword, which he will miss in the great final contest or eclipse of the gods. Like Freyja, he was the patron of marriage, and probably the two were at one time conceived as united, hermaphrodite-wise. F. was held in great veneration, especially in Sweden, of which he was patron-god, and also in Iceland. His chief temple was at Upsala, where a bloody offering was yearly made to him of men and animals. His festival was at the winter solstice, the turn of the year—Yule-tide. While the god was borne round the land, all strife was laid aside. (Does 'the procession of the boar's-head,' at Christmas-time, commemorate F., who rode on the boar, Gullinbursti, and whose symbol was the boar's-head?) The circumstance that the Saxon form of F.'s name, Fro, has been preserved in the German name of a Christian festival, Fronleichnam (Corpus Christi, the Lord's body), seems to shew that it had become among these peoples the abstract term for a god.

FREYTAG, GUSTAV, a dramatic poet and novelist of Germany, was born 13th July 1816, at Kreuzburg, in Silesia, studied at the universities of Breslau and Berlin, and took his degree in philosophy in 1838. His first important work was a comedy, entitled *Die Brautfahrt, oder Kunz von Rosen* (Breslau, 1844). Among his other productions may be mentioned *In Breslau* (Berlin, 1845), which is a collection of small poems written in a popular style; the dramas *Die Valentine* (Leip. 1847) and *Graf Waldemar* (Leip. 1848); and the comedy entitled *Die Journalisten* (1854). An edition of his dramatic works was published at Leipsic, in 3 vols., 1848—1850. But his greatest achievement in literature is undoubtedly *Soll und Haben* (Leip. 1855), a novel of German citizen-life. It has been translated into English under the title of *Debit and Credit* (1858). In 1859, F. published a new classical drama, *Die Fabier*, a second edition of which appeared the following year. A series of prose pictures from German History, entitled *Neue Bilder aus dem Leben des Deutschen Volkes* (Leip. 1862), was translated by Mrs Malcolm, under the title of *Pictures of German Life*. The same lady published, in 1863, *The Lost Manuscript*, a translation of *Die Verlorene Handschrift*, published in the previous year by Freytag. In consequence of a difference with the publisher of the *Grenzboten* (Border Messenger) in 1870, he retired from the editorship of that journal, which he had conducted for 23 years, and became the editor of a weekly paper published at Leipsic.

FRIAR, a name common to the members of certain religious orders in the Roman Catholic Church, and generally employed in contradistinction to the name Monk and Regular Clerk (see these articles). The name friar, although from its etymology (*frère*, brother) it belongs to the members of all religious brotherhoods, yet has come to be reserved almost exclusively for the brethren of the Mendicant orders. It is applied chiefly to the four great orders, Dominicans, Franciscans, Augustinians, Carmelites, and later, to the Trinitarians, and to the various branches of these orders. The Franciscans were properly denominated 'Friars Minor' (*Fratres Minores*). The Dominicans received, in contrast, the title 'Friars Major,' which, however, was perhaps rather a sobriquet than a serious name. These several bodies of friars, too, were popularly called, from the colour or other peculiarity of their habit, Grey Friars (Franciscans), Black Friars (Dominicans), White Friars (Carmelites) Crutched [or Crouched (*Cruciati*, 'crossed')] Friars (Trinitarians), so called from the cross which was embroidered upon their habit. This is the origin of the names of the several localities in London, and other towns thus designated, to the present day. In the orders to which we refer, the friars who are in priest's orders are styled 'father.' The other members are called simply 'brother.' The vow taken by friars at profession is of the class called in the Catholic Church 'solemn,' and is held to render null and void any contract of marriage entered into by the party subsequently to his religious profession.

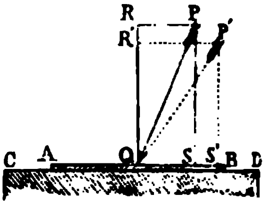
FRIARS' BALSAM. See BENZOIN.

FRI'CTION. When one body rubs against another as it moves, a certain force is felt to resist the motion. This resistance is called *friction*. As a considerable proportion of the motive-power in all operations is spent in overcoming the friction of the parts of the machine upon one another, and is thus lost for the useful work, it is of great importance to understand the nature of this obstructive force, with a view to reduce it to the least possible amount. Accordingly, a great many careful experiments have been made on this subject, and the result is a number of precise and valuable facts or laws regarding friction, which are now considered certain and reliable. The more important may be thus stated and illustrated.

When a block of oak—say a cubic foot, which weighs about 60 lbs.—is placed on a horizontal table of cast iron, the two surfaces being flat and smooth, it requires a force of nearly $\frac{2}{5}$ the weight of the block, or 24 lbs., pulling horizontally, to make it slide along the table. This measures the friction between the two surfaces. Another block of the same size and shape laid on the same table, would require the same force to draw it; and if the two were laid side by side, and fastened together so as to become one block, it would evidently require double the force, or 48 lbs., to draw the double block; the amount of the friction being thus still $\frac{2}{5}$ of the weight, or of the pressure between the two surfaces. But suppose that, instead of being laid side by side, the second block were laid on the top of the first, what is to be expected? Here the weight is doubled as before, but the extent of rubbing surface remains unaltered; it would be natural, therefore, to expect that this would make a difference, and that, though the friction would, of course, be increased, the increase would be less than in the former case. Experiment, however, shews that there is no difference, and that the friction is just double in both cases. In short, the unexpected and important fact is established, that, *within certain limits, the friction of any two surfaces increases in proportion to the force with which they are pressed together, and is wholly independent of the extent of the surfaces in contact.*

The amount of friction between two bodies is thus a constant fraction or proportion of the force with which they are pressed against each other. This fraction differs for the different kinds of surfaces. Thus, between oak and cast iron, it is, as already stated, about $\frac{2}{5}$, or more exactly, ·38; for wrought iron on wrought iron (we speak at present of dry surfaces, without grease or unguent of any kind), it is ·44; for brass upon cast iron, ·22. This constant fraction (expressing the proportion between the pressure of two surfaces and their friction) is called the *coefficient of friction* for these two surfaces.

Another way of illustrating this law of friction is the following, which has an important bearing on the erection of structures, and on mechanics in general. Suppose a slab AB, in contact with another slab CD, of the same or of different material; and that a force PQ presses on AB obliquely. Let QR be the perpendicular to the two surfaces, and draw PR, PS parallel to AB and QR, thus resolving the force PQ into two forces, one, PS, pressing AB against CD, the other, PR or SQ, tending to make AB slide towards C. It will clearly depend upon the strength of friction between AB and CD, how far the force PQ may be made to decline from the perpendicular without actually causing the one body to slide on the other. Suppose that when the pushing force is brought into the position P'Q, AB is just ready to slip on CD, and that it is a case of oak upon iron; then, since P'S' or R'Q is the force pressing the surfaces together, and P'R' or S'Q the force tending to produce motion, P'R' will be $\frac{2}{5}$ of R'Q. The angle P'QR' is called *the limiting angle of resistance* of the two surfaces AB, CD; for so long as the direction of the pressure PQ is within that angle, the friction of the surfaces will sustain it; but if the obliquity is greater, the surfaces will slip. This is true, independently of the extent of the surfaces in contact; and also of the amount of the pressure; for the stability depends upon the proportion of PR to RQ, and that is the same, whatever is the length of PQ, so long as its inclination is the same.



If the slab CD were tilted up, so as to form an inclined plane, until AB were on the point of sliding, the angle of inclination would be found to be equal to the limiting angle of resistance RQP'.

Knowing the coefficient of friction of any two substances, their limiting angle of resistance is easily found. *Example.*—The coefficient of
upon hard limestone is ·60; required the li
angle. Take a line QR' of any convenient l
raise a perpendicular R'P' equal to $\frac{6}{10}$ of QR'
join QP'; R'QP' is the angle required: if
it would be found to be about 31°. In
ture, then, the obliquity of the
two surfaces of these mate
considerably within this limit.

oblique pressure of any kind could be sustained. The advantage of railways consists chiefly in the diminution of friction; but were this diminution carried much further, there could be no motion whatever, at least by means of locomotives. Without considerable friction, the driving-wheels of the locomotive would slide round on the rails without advancing; and this sometimes happens, when particular states of the weather render the rails as if they were greased.

The force of friction is often directly employed in mechanics. It is used, for instance, to communicate motion by means of belts, chains, &c. It is the force that holds a knot. It is specially useful when a machine, with great momentum, has to be checked or arrested in its motion. The best example of this is the *break* used on railways. By means of a system of levers, blocks of wood are made to press against the circumferences of a number of the carriage-wheels; and thus the momentum of a train weighing hundreds of tons, and moving with a velocity of perhaps 50 miles an hour, is gradually destroyed in a wonderfully short space of time.

Friction-wheels are employed to diminish the friction of axles on their supports. Two wheels, of large circumference in proportion to their weight, are placed close together, parallel to each other, and so that the one seems to overlap the half of the other; in the notch thus formed by the upper circumferences of the wheels one end of the axle rests; a similar arrangement being made for the other end. The friction, which formerly acted directly on the axle, is by this arrangement referred to the axles of the friction-wheels, and is, by the laws of mechanics, reduced in the ratio of the circumference of the friction-wheel to the circumference of its axle. In order to render the friction of the friction-wheels themselves the least possible, they are made as light and as large as is practicable.

FRIEDLAND, a small town of East Prussia, in the circle of Königsberg, situated on the left bank of the Alle, 26 miles south-east of Königsberg, in lat. 54° 26′ N. and long. 21° E. Pop. 2784, who are employed in linen-weaving. F. has been rendered famous by the victory obtained there by Napoleon, 14th June 1807, over the Russian forces under Bennigsen. The Russian general found himself unable to cope successfully with an army of 80,000 men, as his own force consisted of less than 50,000 horse and foot; and he was forced to retire after a disastrous battle. He fell back upon the town of Tilsit, on the Niemen, where the treaty between the French and Russian emperors and the king of Prussia, known as the treaty of Tilsit, was drawn up.—FRIEDLAND is also the name of a town in Bohemia, situated on the Wittig, near the Prussian border. It is the capital of a district or duchy of the same name, from which the famous Wallenstein (q. v.) took his title of Duke of Friedland. Pop. of the town, 4250.

FRIEDLAND, VALENTIN, generally called, from his birthplace, *Trotzendorf*, and indisputably the greatest educationist of his age, was a native of Upper Lusatia, and was born 14th February 1490. After the death of his father, in 1513, he went to Leipsic, where he studied under the celebrated Peter Mosellanus and Richard Crocus, acquiring among other things a knowledge of Greek. On the dawn of the Reformation, he proceeded to Wittenberg, where he formed a close intimacy with Luther and Melancthon, and learned Hebrew from a converted Jew. In 1523, he proceeded to Goldberg, in Silesia, as rector of the gymnasium there; left after four years, but returned in 1531, and exhibited the greatest energy in improving the organisation of the school. Success crowned his efforts. The gymnasium of

e sanction of government, tables have
d by Mr John Tidd Pratt, late registrar
societies in England, and by Dr Farr,
y of the English registrar-general. The
ether with useful instructions in the
g of friendly societies, are embodied in
by Mr Pratt, printed by order of the
Commons for the years 1856—1857; and
together with a masterly essay on the
al treatment of the subject, are con-
he twelfth report of the registrar-general.
nperative necessity of acting on correct
such a purpose, it would be superfluous
to dwell; and the necessity of identifying the rates of any society with such responsible authority is the more apparent, as we are told by Mr Pratt that the 'duty of the registrar, in examining the rules of a friendly society, is confined to the consideration of their being in accordance with law and the provisions of the acts in force relating to such an institution; and that, although the registrar certifies to the *legality* of the rules of a friendly society, *it does not follow as a necessary consequence that the constitution of the society is based on good principles*, or that the rates of payment are sufficient in amount to guarantee the promised benefits and allowances.' In fact, there are large numbers of insolvent societies whose rules have been certified in the most regular manner. It cannot be too much insisted upon that the registrar's certificate is absolutely worthless as a guarantee of safety.

We have an idea of a benefit society in its simplest form, if we suppose a hundred men, of 35 years of age, to associate, and make such a payment at first as may be sure to afford each man that shall fall sick during the ensuing year one shilling a day during the term of his sickness. Taking, for the sake of illustration, Mr Neison's Tables, we find that, amongst such a body of men, there will be nearly 100 weeks of illness in the course of the year. This, multiplied by 7, gives the whole sum required, £35, or seven shillings each, which, less by a small sum for interest, will accordingly be the entry-money of each man. A society of individuals of different ages, each paying the sum which would in like manner be found proper to his age, would be quite as sound in principle as one on the above simple scheme. It is only a step further to equalise each man's annual payments over the whole period during which he undertakes to be a paying member.

A point for consideration, however, is the rate at which the funds of the societies may be improved. In many cases, it is best to rest content with taking advantage of the privilege which they enjoy by act of parliament, of depositing their money in the funds or the savings-banks, in which case they are sure to obtain for it interest at a rate of not less than £3, 0*s*. 10*d*. per cent. per annum, or twopence per cent. per day. Some of the older societies have sums invested with the Commissioners for the Reduction of the National Debt, at threepence and twopence-halfpenny per cent. per day; but this is no longer allowed. On the 20th November 1871, the total amount invested at both rates was £1,385,698. Many invest with local building societies, some in corporation debentures, and in many other ways which afford a better rate of interest with safety; and the tendency to abandon the old routine of merely savings-bank deposit seems rapidly and generally growing.

Proceeding upon the grounds of calculation indicated above, Dr Farr suggests the following plan for insuring lives and granting pensions to the classes who live on wages, by combining the provision for insurance payable in a sum at death, and for annuity to begin at the age of 65. This union deprives the two operations of their chief risks, and there is little loss by the lives being better or worse than the average. The policies of insurance and annuities can be easily valued every year. It would be necessary to add a little to the premiums for expense of management and for fluctuation in interest and values of public securities. The plan is so constructed that the annual premium is invariable, that depositors can at any time discontinue their premium and withdraw their deposits, without invalidating or diminishing the amount of their policy, or that they can leave the sum in the guarantee fund as an insurance, to a certain extent, on their lives—a great advantage to persons of uncertain life-incomes. The table is calculated for 3 per cent. interest on the deposits. Proprietary and mutual life-offices add 10—40 per cent. to the calculated premiums for profits, expenses, and bonuses; and Dr Farr proposes to add one-fifth—that is, 20 per cent., for a like reason.

By the act 27 and 28 Vict. c. 43, government gave to the working-classes an opportunity of effecting small life-insurances, or of purchasing immediate or deferred monthly allowances or annuities, in a manner absolutely free from risk, as the credit of the nation itself is pledged to meet the obligation purchased by the subscriptions or payments of the contributor. A great number of people have availed themselves of the new facilities, but it is probable that very many more would have done so had the scale begun at a lower and been continued to a higher point. At present, no life can be insured for less than £20, or for more than £100. Now, many people are willing enough to insure for as much as will cover their funeral expenses, say for £10, who would not be disposed to make further provision for their families. This class, and it is not a small one, is practically excluded from the benefit of the government system, and it would be well, in future legislation, to reduce the minimum to at least half its present amount. At the same time, the maximum might be safely increased to £200 without interfering with the legitimate business of life-assurance companies.

These government insurances are effected through the agency of the Post-office. A list of offices authorised to act may be obtained at any post-office, and at the places so authorised all necessary information and forms of proposal may be had. There also, when filled up, the forms of proposal may be delivered. The premiums charged vary with the age, but not with the sex, of the person to be insured, and the mode in which they are to be paid. For example, the life of a man or woman in his or her 30th year may be insured for £100:

By a single payment of	£43	3	7
By an annual payment throughout life of	2	6	7
By a quarterly payment throughout life of .	0	13	0
By a monthly payment throughout life of	0	4	4
By a fortnightly payment throughout life of	0	2	2
By an annual payment until the age of 60 of	2	13	10
By a quarterly payment until the age of 60 of	0	15	0
By a monthly payment until the age of 60 of	0	5	0
By a fortnightly payment of	0	2	6

Smaller sums may be insured by proportionate payments, but no one payment must be less than two shillings.

If after five years' payments the insurer desires, or is compelled by circumstances, to discontinue his insurance, a portion of the premiums, not being less than one third, will be returned to him.

The sums charged for the purchase of *immediate* annuities vary with the *age and sex* of the person on whose life the annuity is to depend. Thus a man aged 65 can purchase an *immediate* annuity of £10, payable half yearly, for £88, 18s. 4d.; a woman of the same age can purchase a like annuity for £106, 16s. 8d. A man aged 70 can purchase an immediate annuity of £10, payable half-yearly, for [illegible]; a woman of the same age can purchase a like annuity for £84, 19s. 2d.

The sums charged for the purchase of *deferred* annuities, or *deferred* monthly allowances, also vary with the *age and sex* of the annuitant, with the number of years which are to pass before the commencement of the annuity, and with the conditions of the contract as to the mode of purchase, mode of
payment, and return or non-return of pu
money.

When no part of the purchase-money is to
turned, a man aged 30 may purchase a defer
nuity of £10, to commence on his reaching th
60, and to be payable half-yearly, either by an i
ate payment of £24, 3s. 4d., or by an annu
ment, until he reaches the age of 60, of £1,
A woman of like age may purchase a like
by an immediate payment of £32, 8s. 4d.,
annual payment up to 60 of £1, 17s. 6d.; and
aged 30 may purchase a deferred allowa
£2, 7s. 3d. per month, to commence when he
the age of 60, by a payment until he reach
age of 8s. per month; and a woman aged
by a like payment, purchase a deferred allow
£1, 16s. 7d., also to commence at 60.

Purchasers of annuities are permitted t
whether the purchase-money shall be retur
their representatives in case of death before
ing the stipulated age, or to themselves in
desiring for any reason to withdraw fro
arrangement; but for this privilege, they mu
a higher price. Thus, instead of the £24,
referred to above, the purchaser at 30 of
annuity, to commence at 60, would have
£40, 9s. 2d., and so in proportion. No annu
exceed £50 per annum, or £4, 3s. 4d. per
except in the case of husband and wife, wh
each be insured or purchase an annuity to t
amount allowed by the act.

Up to the end of 1872 (i.e. in seven years
half), 3855 life policies were issued under t
for a sum of £293,467, or an average of
policy. During the same period, 3285 an
amounting to £56,248 per annum, were pu
at a cost of £551,735; the average of the
money being about £168, and the average
annuities about £17. Of this number, eight
were immediate, and the remainder deferred.

Several attempts have been made of late y
consolidate and improve the laws regulating f
societies, but hitherto without success. T
bill, introduced in 1874, and withdrawn at
period of the session, will doubtless be
forward by the government in 1875, at
there is a better chance of passing it
House. It is desirable that legislation
vide for full and clear statements of accou
furnished to the members, and the certific
registrar ought to be at least somethin
guarantee, not only that the rules are in con
with law, but that the calculations on whic
are based are not, as in many cases now, ab
worthless. That the societies do excellent
the main; that they foster provident hab
they do, if not perfectly, yet in the
torily, provide for needful help in ti
pressure, no one can reasonably doub
the more important, seeing how confide
numbers of persons rely upon them, that e
should be done to make them really safe
worthy, and towards the realisation of this
efforts of legislation should now be directed.—
Report of Friendly Societies Commission (187

s with commendable modesty to the
ture itself, as far as that is possible,
in particular, the knotty points of
rinity (see Barclay's *Catechism and*
f Faith, published in 1673, where the
the questions—to avoid theological
are taken from the Bible itself). This
llowing to each individual the full
the Scriptures, has, of course, rendered
more difficult to ascertain to what
idual minds, among the Society, may
d in their mode of apprehending and
explaining the facts of Christianity.
pal distinguishing doctrine is that of
of Christ in man,' on which many of their outward peculiarities, as a religious body, are grounded. The doctrine of the internal light is founded on the view of Christ given by St John, who, in the first chapter of his gospel, describes Christ—the Eternal Logos—as the 'life' and 'light of men,' 'the true light,' 'the light that lighteth every man that cometh into the world,' &c. Barclay taught that even the heathen were illumined by this light, though they might not know—as, indeed, those who lived before Christ *could* not know—the historical Jesus in whom Christians believe. In their case, Christ was the light shining in darkness, though the darkness comprehended it not. The existence of 'natural virtue' (as orthodox theologians term it) among the heathen was denied by Barclay, who regarded all such virtue as Christian in its essence, and as proceeding from the light of Christ shining through the darkness of pagan superstition. These opinions would seem to be somewhat freer than those expressed in the General Epistle of the Society published in 1836, wherein they refuse to acknowledge 'any principle of spiritual light, life, or holiness inherent by nature in the mind of man,' and again assert, that they 'believe in no principle whatsoever of spiritual light, life, or holiness, except the influence of the Holy Spirit of God bestowed on mankind in various measures and degrees through Jesus Christ our Lord;' but, on the other hand, in a little treatise published by the Society in 1861, it is affirmed that 'the Holy Spirit has always been afforded in various measures to mankind;' while stress is also laid on the statement of St Paul, that 'the grace of God (understood by Friends to signify the 'operation of the Divine Spirit') that bringeth salvation, *hath appeared to all men*;' while another exponent of their views, Mr T. Evans of Philadelphia (see *Cyclopædia of Religious Denominations*, Lond., Griffin & Co., 1853), states that 'God hath granted to all men, of whatsoever nation or country, a day or time of visitation, during which it is possible for them to partake of the benefits of Christ's death, and be saved. For this end, he hath communicated to every man a measure of the light of his own Son, a measure of grace or the Holy Spirit, by which he invites, calls, exhorts, and strives with every man, in order to save him; which light or grace, as it is received, and not resisted, works the salvation of all, even of those who are ignorant of Adam's fall, and of the death and sufferings of Christ; both by bringing them to a sense of their own misery, and to be sharers in the sufferings of Christ inwardly; and by making them partakers of his resurrection, in becoming holy, pure, and righteous, and recovered out of their sins.' Hence it may be safely asserted that they hold a broader (or, as others would say, a more latitudinarian) view of the Spirit's working than any other Christian church or society. In America, about the year 1827, Elias Hicks, a Friend of very remarkable powers, created a schism in the Society, by the promulgation of opinions denying the miraculous conception, divinity, and atonement of Christ, and also the authenticity and divine authority of the Holy Scriptures. About one-half of the society in America adopted the views of Hicks, and are known as Hicksite Friends; their opinions, of course, are repudiated by the rest of the Society, who may be described as Orthodox Friends. The Hicksite schism thoroughly alarmed the latter, both in England and America, and a movement was begun in favour of education, of a doctrinal belief more nearly allied to that of the so-called 'Evangelical' party, and of a relaxation in the formality and discipline of the Society. The leader of this movement was Joseph John Gurney, of Norwich. This

new tendency, however, excited considerable opposition among some of the Friends in America; and the consequence was a division among the Orthodox Friends themselves, and the formation of a new sect, called 'Wilburites,' after the name of their founder, John Wilbur, who are noted for the strictness with which they maintain the traditions and peculiarities of the Society. (See *Friendly Sketches in America*, by William Tallack. Lond., Bennett, 1862.) Some slight indications of theological differences have manifested themselves in England also.

2. *Practice.*—It is in the application of their leading doctrine of the 'internal light' that the peculiarities of the Friends are most apparent. Believing that it is the Holy Spirit, or the indwelling Christ, that alone maketh wise unto salvation, illumining the mind with true and spiritual knowledge of the deep things of God, they do not consider 'human learning' essential to a minister of the gospel, and look with distrust on the method adopted by other churches for obtaining such—viz., by formally training after a human fashion a body of youths chosen on no principle of inward fitness. They believe that the call to this work now, as of old, is 'not of men, neither by man, but by Jesus Christ, and God the Father;' and that it is bestowed irrespectively of rank, talent, learning, or sex. Consequently, they have no theological halls, professors of divinity, or classes for 'students.' Further, as fitness for the ministry is held to be a free gift of God through the Holy Spirit, so, they argue, it ought to be freely bestowed, in support of which they adduce the precept of the Saviour—'Freely ye have received, freely give;' hence those who minister among them are not paid for their labour of love, but, on the other hand, whenever such are engaged from home in the work of the gospel, they are, in the spirit of Christian love, freely entertained, and have all their wants supplied: in short, the Friends maintain the absolutely voluntary character of religious obligations, and that Christians should do all for love, and nothing for money. It also follows from their view of a call to the work of the ministry, that women may exhort as well as men, for the 'spirit of Christ' may move them as powerfully as the other sex. The prophecy of Joel as applied by Peter is cited as authority for the preaching of women: 'On my servants and on my handmaidens I will pour out in those days of my spirit, and they shall prophesy.' They also adduce the New Testament examples of Tryphæna, Tryphosa, the beloved Persis, and other women who appear to have laboured in the Gospel. Their mode of conducting public worship likewise illustrates the entireness of their dependence on the 'internal light.' In other religious bodies, the minister has a set *form* of worship, through which he must go, whether he feels devoutly disposed or not. This seems objectionable to the Friends, who meet and remain in silence until they believe themselves moved to speak by the Holy Ghost. Their prayers and praises are, for the most part, silent and inward. They prefer to make melody in their hearts unto God, considering such to be more spiritual than the outward service of the voice.

The doctrine of the 'internal light' has also led the Friends to reject the ordinances of Baptism and the Lord's Supper as these are observed by other Christians. They believe the Christian baptism to be a spiritual one, and not, like the Jewish and heathen baptisms, one with water; in support of which they quote, among other passages, the words of John the Baptist himself: 'I baptise you with water, but there cometh one after me who shall baptise you with the Holy Ghost and with fire.' Similarly do they regard the rite of the Eucharist: It is, say they, inward and spiritual, and consists not in any symbolic breaking of bread and drinking of wine, but in that daily communion with Christ through the Holy Spirit, and through the obedience of faith, by which the believer is nourished and strengthened. They believe that the last words of the dying Redeemer on the cross, 'It is finished,' announced the entire abolition of symbolic rites: that under the new spiritual dispensation then introduced, the necessity for such, as a means of arriving at truth, ceased, and that their place has been abundantly supplied by the Comforter, the Holy Ghost, whose office it now is to lead and guide men into all truth. The true Christian supper, according to them, is set forth in the Revelations—'Behold I stand at the door and knock: if any man hear my voice and open the door, I will come in unto him, and will sup with him and he with me.' For the same reason—viz., that the teaching of the Spirit is inward and spiritual—the Friends ignore the religious observance of days and times, with the exception of the Sabbath, which some at least among them regard as of perpetual obligation.

The taking or administering of oaths is regarded by Friends as inconsistent with the command of Christ, 'swear not at all,' and with the exhortation of the apostle James—'Above all things, my brethren, swear not, neither by heaven, neither by the earth, neither by any other oath: but let your yea be yea; and your nay, nay; lest ye fall into condemnation.' They have also refused to pay tithes for the maintenance of what they hold to be a hireling ministry, believing that Christ put an end to the priesthood and ceremonial usages instituted under the Mosaic dispensation, and that he substituted none in their place. In consequence, all consistent Friends have been regularly mulcted of plate, furniture, or other goods, to the value of the amount due. The recent conversion of tithe into *rent-charge*, however, has, in the opinion of many Friends, largely removed objections to the payment to the ecclesiastical demand. In regard to the civil magistracy, while they respect and honour it, as ordained of God, they are careful to warn the members of their Society against thoughtlessly incurring its responsibilities, involving as it does the administration of oaths, the issuing of orders and warrants in reference to ecclesiastical demands, the calling out of an armed force in cases of civil commotion, and other duties inconsistent with the peaceful principles of the Society. The Friends have likewise consistently protested against war in all its forms: and the Society has repeatedly advised its members against aiding and assisting in the conveyance of soldiers, their baggage, arms, ammunition, or military stores. They regard the profession of arms and fighting, not only as diametrically opposed to the general spirit of Christ, whose advent was sung by angels in these words: 'Glory to God in the highest, and on earth peace, good-will toward men;' but as positively forbidden by such precepts as—'Love your enemies, bless them that curse you, do good to them that hate you, and pray for them which despitefully use you and persecute you;' also, 'Resist not evil: but whosoever shall smite thee on thy right cheek, turn to him the other also;' and while they acknowledge that temporary calamities may result from adopting this principle of non-resistance, they have so strong a faith in its being essentially the dictate of divine love to the Christian heart, that they believe God, by his wise and omnipotent providence, could, and will yet make it 'mighty to the pulling down of the strongholds of iniquity.' The world, they believe, will by and by confess that the peace-makers are most truly the children of God. The efforts of the Society for the

meetings. Its function is to consider generally the entire condition of the Society in all its aspects. It receives in writing answers to questions it has previously addressed to the subordinate meetings, deliberates upon them, and legislates accordingly. To it exclusively the legislative power belongs. Though thus constituted somewhat according to Presbyterian order, yet any member of the Society may attend and take part in the proceedings.

Women have also a special sphere of discipline allotted to them: they inspect and relieve the wants of the poor of their own sex, take cognizance of proposals for marriage, deal with female delinquents privately, and under certain restrictions may even do so officially, though in the 'testimony of disownment' they have always the assistance of members of the other sex.

The Society of F., in the multitude of its regulations, has not forgotten the poor; charity in its narrower, as well as in its broader sense, has always been a beautiful feature of its members. The care of the poor was one of the earliest evidences which Christianity afforded to the Gentiles of the superiority and divine character of its principles; and it is honourable to the Society that a similar provision for those united to them in religious fellowship appears to have been one of the earliest occasions of their meetings for discipline. Nevertheless, in accordance with their ruling principle, that all Christian duty should be left for its fulfilment to the spontaneity of Christian love, and not performed under compulsion of any kind, 'the provision for the poor is purely voluntary; its only ground is Christian charity.' It is no small proof of the sincerity of their religious professions—considering the selfishness of human nature—that their liberality is a proverb throughout Britain and America.

Their number at present amounts, it is believed, to about 120,000, of which more than 90,000 belong to the United States.

FRIES, ELIAS, a distinguished Swedish botanist, was born 15th August 1794, in the district of Femsjö, and studied at Lund, where he became demonstrator in botany in 1828. In 1834 he was translated to the university of Upsala, as professor of practical economics, with which, after the death of Professor Wahlenberg, in 1851, the chair of botany was conjoined. F.'s researches embrace the entire field of botany, *phanerogamous* as well as *cryptogamous* plants, and he was the first to introduce into Sweden the morphological theory, the basis of which is to be found in his *Systema Orbis Vegetabilis* (Lund, 1825). His earliest important work was *Observationes Mycologicæ* (2 vols., Copen. 1815 1818). This was followed by his *Systema Mycologicum* (3 vols. Greifsw. 1821 1829; Supplement, 1830), which was completed in his *Elenchus Fungorum* (2 vols. Greifsw. 1828), and later in his *Novæ Symbolæ Mycologicæ* (Upsala, 1851). For another department of cryptogamic botany, the lichens, F. has done great service by his *Lichenographia Europæa Reformata* (Lund and Greifsw. 1831). Among his monographs the *Symbolæ ad Historiam Hieraciorum* (Upsala, 1848), deserves especial mention. He has also written a good deal on the *Flora* of Scandinavia, and especially his *Summa Vegetabilium Scandinaviæ* (Upsala, 1846, *et. seq.*), is reckoned one of his best productions. His *Herbarium Normale* (Upsala, 1847), collected at great expense, and with incredible industry, contains dried specimens of all the rarest plants of Scandinavia. He has also composed a multitude of small dissertations on his favourite subjects, several of which have been translated into German. In 1851 he was appointed director of the Botanical Museum and Garden attached to the university of Upsala, and in 1853 rector of the university. F. is a member of the Academy at Stockholm, and of other learned bodies.

FRIES, Jakob Friedrich, the founder of a philosophic school in Germany, was born at Barby, in Prussian Saxony, 23d August 1773, studied at Leipsic and Jena, and in 1805 went to Heidelberg, as professor of philosophy and mathematics. In 1816 he accepted a call to the chair of speculative philosophy at Jena, but was deprived of his professorship, on account of his participation in certain democratic disturbances of 1819. In 1824, however, he was appointed to the chair of physics and mathematics, which he occupied till his death, 10th August 1843. F.'s writings are very numerous. Some of the more important are his *System der Philosophie als evidente Wissenschaft* (Leip. 1804); *Neue oder anthropologische Kritik der Vernunft* (3 vols. Heidelb. 1807; 2d ed., 1828—1831); *System der Logik* (Heidelb. 1811; 3d ed., 1837); *Handbuch der physischen Anthropologie* (2 vols., Jena, 1820—1821; 2d ed. 1837—1839); *Die Lehren der Liebe, des Glaubens, und der Hoffnung* (Heidelb. 1823); and *Geschichte der Philosophie* (2 vols. Halle, 1837—1840). In his philosophy, F. followed the method of Kant, but believing that method incomplete, he sought to supplement by an analytical nature-doctrine (*analytischen naturlehre*) of the human soul, which he designated philosophic anthropology. His *Glaubenslehre*, or Doctrine of Faith, by which he hoped to repair the ravages which the critical philosophy had made upon the certainty of our knowledge, resembles, in some respects, Jacobi's doctrine of the Intuition of the Pure Reason. De Wette adopted it as the basis of his religious philosophy. Some of his disciples, Apelt, Schleiden, Schlömilch, Friedrich Francke, and Schmidt, published at Leipsic in 1848—1849, several philosophic papers, entitled *Abhandlungen der Fries'schen Schule.*

FRIE'SLAND or VRIESLAND (ancient *Frisia*). West F., which is one of the most northern and wealthy provinces of the Netherlands, has an area of 1253 square miles, and a population which, in November 1869, numbered 292,354. It lies between lat. 52° 40′ and 53° 30′ N., and long. 5° 30′ and 6° 20′ E., and is bounded to the N. by the German Ocean, and to the W. and S.W. by the Zuiderzee. The land, which is flat, and in some parts even below the level of the sea, is intersected by canals and streams in every direction, and abounds in lakes and marshes. The dikes, sluices, and canals, by means of which the country is protected from inundations of the sea, are under the supervision of a special board, which levies an assessment, called a dike tax, on the land-owners of the province. The lakes and ponds abound with fish; while the older marshes which have been redeemed and drained, form rich pastures, admirably suited to the rearing of horses, cattle, sheep, and pigs. Large quantities of peat are made. From 4 to 5 million lbs. of cheese and butter are annually exported from F.; wheat, rye, flax, hemp, clover, colza, and chicory are principal productions. Exports chiefly to England. F. is amply endowed with schools and charitable institutions. The inhabitants are principally Calvinists. The chief town is Leeuwarden. The islands, Schiermonnikoog, Ameland, and Terschelling, which lie off the north coast, and are included in the province, carry on extensive fishing operations.—East F., which lies between 53° 8′ and 53° 40′ N. lat., and 6° 50′ and 8° E. long., with an area of 1144 square miles, and population amounting to 195,809, is comprised within the Hanoverian district of Aurich, chief towns, Emden and Aurich. It is bounded on the N. by the German Ocean, W. by Holland, S. by Aremberg, and E. by Oldenburg. Like West F.
it is low and flat, and requires the prote
dikes and sluices. Fishing and agricult

The family is an extremely one, and distributed over all parts of the represented in Britain by finches, linnets, grosbeaks, crossbills, &c., and including er-birds, bob-a-links, cardinal-birds, why- Some naturalists extend its limits so as to include in it other groups, as buntings, larks, &c., often regarded as forming distinct families.

FRISCHES HAFF ('Fresh-water Bay'), a large lagoon on the coast of Prussia, south-east of the Gulf of Dantzic. It is rather less than 60 miles in length from north-east to south-west, with a breadth which varies in different parts from 4 to 12 miles, and an area of 318 square miles. It was once entirely walled off from the Baltic by the Frische Nehrung, a narrow spit of land extending for about 40 miles along its northern shore. In 1510, however, the waters of the F. H. broke over the Frische Nehrung, and formed the passage called the 'Gatt,' which unites this shore-lake with the Baltic. The Gatt is only from 10 to 15 feet in depth. All large vessels load and unload at Pillau, which is situated at the mouth of the Gatt, on the shore of the Gulf of Dantzig. Cargoes are conveyed to and from the ports on the F. H. by means of lighters. The Pregel, Frisching, Passarge, and two arms of the Vistula, fall into this lagoon.

FRISIANS. The Frisians (Lat. *Frisii*), were an ancient Teutonic race dwelling, together with the *Batavi*, the *Bructeri*, and the *Chauci*, in the extreme north-west of Germany, between the mouths of the Rhine and Ems. They became tributaries of Rome under Drusus, and for a time remained faithful to the Roman alliance; but, in 28 A. D., they were driven to hostilities by the oppression of their protectors; and although partially subdued, they again rose against the Romans under Civilis. As the Frankish tribes advanced further south, the Frisii spread themselves over the islands which are formed by the embouchures of the Rhine, the Maas, and the Scheldt, and gradually merged into the two branches of the *Frisii majores* and *Frisii minores*, the former occupying the districts west of the Fly or Zuyderzee, and the latter those east of those waters. In the 5th c., a band of the Frisii joined the Saxons and Angles in their invasion of Britain. At a later period, the Frisii of the south-west were brought under the Frankish rule by Pepin d'Heristal, who defeated their leader in 689, and compelled him and his people to embrace Christianity. In 785 the eastern branch of the tribe was brought under subjection by Charlemagne, who despatched Christian teachers to preach the Gospel to them, and who, in 802, defined their rights by the *Lex Frisionum*. Their country was divided into three parts, two of which were annexed, in the partition of the Carlovingian empire, to Louis the German, and constituted East Friesland, while the remainder, forming West Friesland, fell to the share of Charles the Bald. The latter of these provinces was subdivided in the 10th and 11th centuries into the hereditary countships of Holland, Zealand, Guelders cum Zutphen, and the bishopric of Utrecht cum Yssel; and hence the districts still retaining the name of Friesland have been circumscribed to their present limited boundaries, while the distinctive national characteristics of the F. have been obliterated by contact with their neighbours, and their history has merged in that of Holland and Hanover.

The *Frisian language* occupies a place intermediate, in some respects, between Anglo-Saxon and Old Norse. Of all the Teutonic dialects, it shews the closest affinities to English. There is a Frisian literature dating from the 12th century. Our knowledge of Old Frisian is derived from collections of laws, of which each 'Gau' had its own set written down in its own dialect. The *Asegabuch*, a set of laws valid for all Frisians, was composed about 1200. A complete collection of the Frisian laws still extant, was published by Richthofen

(*Fries. Rechtsquellen*, Gött. 1840). Since the 15th c., the Frisian has been encroached upon on all sides by the Dutch, the Low and High German, and the Danish; so that of the extensive area over which it once prevailed, it now subsists only in isolated spots, such as the islands of Wangeroge and Heligoland, the district about Leeuwarden, Molquerum, &c. This Modern Frisian is confined to the peasantry, and is not used in the schools or the churches. It is broken up into endless local dialects, each of which is unintelligible beyond the circumscribed district in which it is spoken. Several attempts have been made in the present century to revive the Frisian, by publishing some of the older specimens of its literature. Among these we may instance the *Friesche Rymlerye* of Gysbert Japicx (edited by Epkema, 1824); *Waatze Gribberts brilloft* (Leeuw. 1812); and *It Libben fen Aagtje Ysbrants* (Sneck, 1827). Hettema and the brothers Halbertsma are noted both for their original compositions in Frisian, and for their commentaries on Frisian jurisprudence. Among Frisian vocabularies, the best known are Wiarda's *Alt Fr. Wörterbuch* (1786); Richthofen's *Altfriesisches Wörterbuch* (1840), and N. Outzen's *Glossarium der F. Sprache* (Cop. 1837). J. Grimm and Rask have written on Frisian grammar, and the *Frisisk Sproglære* of the latter has been translated into Dutch by Hettema (Leeuw. 1832).

FRIT (*Oscinis Frit*, or *Chlorops Frit*), an insect of the same family with the house-fly; an active greenish-black fly of the size of a large flea, which does great injury to barley crops in some parts of the north of Europe. It lays its eggs in the flowers, and its larvæ live on the young grains. Linnæus affirms that a tenth part of the barley in Sweden and Lapland is annually destroyed by it. It is not known in Britain, but is nearly allied to the insects called corn-fly and wheat-fly.

FRITH, or **FIRTH** (Lat. *fretum*, Gr. *porthmos*; from the same root as Ferry, q. v.), an arm or channel of the sea that is passed or crossed; the opening of a river into the sea.

FRITH, William Powell, R.A., an eminent English artist, the son of an innkeeper at Harrogate, Yorkshire, was born in that town in 1820. In 1840, he first exhibited, at the Royal Academy, London, a scene from Shakspeare's *Twelfth Night*, 'Malvolio before the Countess Olivia,' which at once attracted attention, as giving promise of future excellence. In 1841, his painting of the 'Parting Interview of Leicester and his Countess Amy,' from Scott's *Kenilworth*, evinced a marked improvement in his style and manner. Thenceforth he rose rapidly in public estimation, and his subsequent productions amply confirmed the high anticipations that had been formed of his skill and power. Among the paintings exhibited by him in successive years were the following: 'My Wife would bid both stand up to see which was the Tallest,' a scene from the *Vicar of Wakefield*, in 1842; 'English Merry-making a Hundred Years ago,' in 1847; 'An Old Woman Accused of Witchcraft in the Time of James I.,' in 1848; and 'Coming of Age,' in 1849; &c. F. was elected an Associate of the Academy in 1845, and a Royal Academician in 1853. In 1854, his 'Life at the Seaside' was one of the leading features of the Exhibition. 'The Derby Day,' exhibited in 1858, and 'Claude Duval, in 1860, are considered two of the most successful of his performances. For the 'Railway Station' (1862), his greatest painting, he is said to have received 8700 guineas. In 1872, by command of the Queen, he painted the 'Marriage of the Prince of Wales.' F. was elected an honorary member of the Imperial Academy of Fine Arts at Vienna in 1869; and of the Royal Academy of Belgium in 1871.

FRITHJOF'S SAGA, which was probably first written down at the end of the 13th or in the beginning of the 14th c., is an ancient Icelandic myth, which records the life and adventures of the hero Frithjof (properly *Fridhthjofr*; i.e., 'peace-destroyer,') who loved the beautiful Ingeborg, the daughter of a petty king of Norway. After being rejected by the brothers of Ingeborg, and having committed various acts of revenge on his enemies, he comes to the court of the old king Hring, to whom Ingeborg has been married, and is received with kindness. At the death of her husband, Ingeborg is married to her lover, who acquires with her hand the dominions of Hring, over which he rules prosperously to the end of his days. Frithjof is supposed to have lived in the 8th c.; but some writers assign to him a much earlier period. This Saga was included by Björner in his collection *Nordiska Kämpadater* (Stock. 1737); and by Rafu in his *Fornaldar Sögur Nordhrlanda* (Copen. 1829). Attention has of late years been more especially drawn to this ancient Saga, which is, in fact, merely one of a number of similar mythical narratives, in consequence of the distinguished Swedish poet, Bishop Tegner, having selected it for the groundwork of a poem (*Frithjof's Saga*), which was published in its complete form in 1825, and at once became the most popular poem that had ever appeared in Sweden, and raised its author to the height of his reputation. Tegner follows the Saga so closely, that the merits or demerits of the plan of the story must be ascribed more to the original than to himself; but to foreigners the poem scarcely seems to present the excellences that have been attributed to it by Swedish critics. The diversity of metre employed in the 24 cantos, of which each differs wholly from the others, detracts from the completeness of the whole, and produces an inharmonious effect. The *Frithjof's Saga* of Tegner has been translated into several other languages; among the five English translations, we may instance those by R. G. Latham (1838) and G. Stephens (1841).

FROBISHER, SIR MARTIN, a distinguished naval adventurer of the Elizabethan period, the first Englishman who sought to discover a north-west passage to China, was a native of Doncaster, but the year of his birth is unknown. For many years, he in vain laboured to impress English merchants with an idea of the importance of a north-west passage; but at length, being patronised by some persons of rank and fortune, he succeeded in raising money enough to fit out two small vessels of 25 tons each, and a pinnace of ten tons. With these he sailed from Deptford on June 8, 1576, the queen, who was then at Greenwich, bidding them God speed on their venturous way by 'shaking her hand at them out of the window.' Steering their course north, they, in lat. 61° N., sighted the southern part of Greenland, which F. took to be the Friesland of Zeno, on the 11th July, to the east point of which F. gave the name of 'Queen Elizabeth's Foreland;' and on the 28th, they sighted *Meta Incognita*. On the 11th of August, F. entered the strait which bears his name, and which forms one of the entrances from Davis' Strait into Hudson's Bay. After about a fortnight's exploration of the coasts and islands, F. having lost, through the treachery of the natives, a boat and five men returned to England. He brought with him some ore picked up on one of the islands he discovered, in which some gold was found. Visions of immense wealth to be derived from further search in these northern lands floated before the eyes of the speculators of the time, who immediately fitted out another and better appointed expedition, giving the command to Frobisher. He sailed in May 1577, but his discoveries, hampered as he was by the gold-seeking operations, which turned out comparatively trifling, did not extend further than the neighbourhood of the strait he had before reached. A third expedition was sent out in the year following; but geographical science appears to have been but little benefited by it. F. afterwards served under Drake in the West Indies; and for his distinguished bravery in the fight with the Spanish Armada, July 26, 1588, he received the honour of knighthood. He afterwards commanded a squadron sent out to ravage the Spanish coast. He died on November 7, 1594, from the effects of a wound received while leading an attack by sea against Brest.

FROBISHER STRAIT, a passage between the west side of Davis' Strait and the north side of Hudson's Strait, is 140 miles long, with an average breadth of 20. It extends in lat. from 62° to 64° N., and in long. from 65° to 73° or 74° W. It is not of any practical value as a channel of communication; and, in fact, it has been very seldom visited by vessels bound either westward or eastward.

FROG (*Rana*), a genus of *Batrachia*, having in the adult state four legs and no tail, no gills, four toes on each of the fore-feet, five on each of the hind-feet, the feet more or less webbed; the head flat, the muzzle rounded; the mouth very large, a row of small teeth in the upper jaw, and an interrupted transverse row on the middle of the palate. The young (tadpoles) breathe by means of gills; external gills forming little fringes at the sides of the neck when they are very young, which, however, in a few days disappear; the gills, which remain until the tadpoles undergo their final metamorphosis into frogs, being very numerous minute crests attached to four cartilaginous arches on each side of the neck, in a cavity to which the water enters from the mouth, and from which it is expelled by one or two small orifices. Tadpoles have no legs, and the body tapers into a tail, and thus has a fish-like form, very different from that of the mature F., the tail being furnished with a membranous border like a fin. The mouth of the tadpole is a horny beak, which falls off when it becomes a frog. When this metamorphosis takes place, the hind-legs grow first, and afterwards the fore-legs begin to appear, the tail being gradually absorbed. Tadpoles are capable of living in water only; but the mature F. visits the water only occasionally, although generally capable of remaining long immersed, and always preferring moist places. In respiration, frogs draw in air through the nostrils, by movements of the muscles of the throat, and expel it by contraction of those of the lower part of the abdomen. The thin smooth skin of frogs is also believed to be subservient to the aëration of the blood. The skeleton is destitute of ribs. The eye is large and very beautiful. The colours are often pleasing, and the general aspect agreeable, in some species very much so, forming a strong contrast to the repulsive appearance presented by toads, notwithstanding the close affinity between them both in structure and habits. The greater proportionate length and strength of the hind-legs enables frogs to leap to a distance wonderful for creatures of their size, instead of crawling as toads do, and their activity and liveliness complete the contrast. The males have on each side of the neck a delicate membrane, which becomes inflated with air when they croak. The power of voice in the females is much inferior. The croaking of numerous frogs in marshy places, or around ponds and ditches, often makes an amusing and curious concert; but the powers of voice possessed by the frogs of Britain are not to be compared with those of the great Bull-frogs (q. v.) of North America; whilst the neighbourhood of Rio Janeiro is enlivened as night comes on by the Blacksmith F., which croaks so sonorously that the noise is like the clanging of a hammer on an anvil, the intermingled

voices of some other kinds resembling the lowi cattle at a distance; and in Peru, there is a l large dimensions, which has acquired the nam *Trapichero*, or Sugar-miller, because its voice a grating sound like that produced by a sugar The confused blending of the voices of diff species of frogs, in these countries, destroying stillness of night, is one of the things most tain to arrest the attention of the stranger. colder climates, frogs usually bury themselv mud, and spend the winter in torpidity. In weather, they conceal themselves under shrubs in tufts of herbage, from which rain quickly c them to come forth, multitudes often appe where not one was to be seen before. They chiefly on insects, slugs, &c. The beaks of tad are adapted to the eating of leaves and other table food, on which Cuvier says they entirely sist; but the younger Buckland, in his *Curiosi Natural History* (4th ed., Lond. 1859, pp. 2— an amusing account of the habits of tadpoles, correctly describes them as shewing a great av for animal food, crowding round a dead kitten nibbling at the toes of little boys who wa pools where they abound. The spawn of fr a gelatinous mass, in which the eggs are conta and which swells greatly by imbibing moi Impregnation takes place after it is deposite with the spawn of fishes.

The only species of F. certainly known t British is that called in France the RED F. *temporaria*), which is abundant in most par England and Scotland, but is said not to be indigenous to Ireland, and to have been introd into that island in 1696. Its generally reddish co varied with black spots and patches, readily di guishes it from the GREEN F. or EDIBLE F. (*R. lenta*) of the south of Europe—sometimes said to have been found in Britain—which is olive with yellow stripes along the back, and larger than the red species. The so produces a number of other species, generally more numerous in warmer remarkable peculiarity is exhibited by tropical countries in a hornlike pr each eye. These have been separa genus (*Ceratophris*). The TREE FROGS (q. the most beautiful and interesting of all, extremities of the toes enlarged into a sort o secreting a viscid humour. Several have been separated from the Linnæan but there is a strong family likeness among all.

The use of frogs for food is genera with disgust in Britain, but it is very some of the southern countries of Europ are regarded as particularly delicate. chiefly used as food in Europe is the GREE *esculenta*), already mentioned, which gre in ponds and slow streams in France, Germany, and Italy. It feeds chiefly after which it darts with great agility on and may often be seen swimming above water, or basking in the sunshin there taken for the market by nets, and by of rake. F.'s Chronicles embrace the events occurring 1326—1400. They are valuable documents for illustrating the character and manners of his age. The pageantry of feudal times brightens his pages; the din of arms, the shouting of knights, and the marshalling of troops, is ever and anon heard; while 'visions of fair women' rise before us as we read. The gorgeous feasts and spectacles in which F. so much delighted are set forth in copious details; and though F. is no philosopher, his shrewd observations and richly minute descriptions have helped others to philosophise. F.'s Chronicles first appeared at Paris about the end of the 15th c., under the title of *Chroniques de France, d'Angleterre, d'Ecosse, d'Espagne, de Bretagne, de Gascogne, Flandres et lieux d'alentour.* The best edition is that of Buchon (15 vols., Par. 1824—1826). His poems have likewise been published by Buchon (Par. 1829). The beautiful MS. of the Chronicles in the library at Breslau was executed in 1468, and was secured to the town in a separate article, when Breslau capitulated to the French in the year 1806. The Chronicles have also been translated into Latin and several modern languages. England has two versions: one executed in 1523–1525 by Bourchier Lord Berners (reprinted in 1812); and the other in 1803–1805 by Thomas Johnes (reprinted by Bohn in 1845). The latter is the more exact; but the former, according to Sir Walter Scott, is the more artless and lively.

FROME, or FROME SELWOOD, a parliamentary and municipal borough, in the east of Somersetshire, on the Frome, a branch of the Avon, 12 miles south-south-east of Bath. The surrounding country is very picturesque, and the town, until modernised early in the present century by the formation of two wide thoroughfares, was a strange old place, with narrow, crooked, and steep streets and lanes, many of which still remain. It manufactures woollens, hats, silk, and cards for dressing woollen cloth. F. has long been famed for its ale. Pop. (1871) 9753. It returns one member to parliament. The once celebrated forest of Selwood was in the vicinity, and part of it remains in its original state.

FROND, in Botany, a term often used to designate the leaves of cryptogamous plants. It was originally introduced as distinctive of organs in which the functions of stem and leaf are combined, and was applied to the leaves of palms, &c. The term *leaf* is now very generally used even as to mosses, ferns, &c., and the term *thallus* is employed as to lichens. In the case of many *Algæ*, the term F. is often used to designate the whole plant except its organs of reproduction.

FRONDE, the name given to a political faction in France during the minority of Louis XIV., which was hostile to the court and the prime minister, Mazarin, and caused great domestic troubles from the year 1648 to 1654. The grasping and despotic policy of Mazarin, to whom Anne of Austria, the queen-regent, had abandoned the reins of government, had given offence to all classes. The princes and nobles saw themselves excluded from all high offices in the state, and their place supplied by foreigners: the parliament was threatened in its political rights, and the people groaned under the burden of taxes and administrative abuses. Parliament, therefore, commenced a course of determined opposition, refusing to register the royal edicts, more especially the disgraceful financial measures. Although the young king, then only nine years old, was obliged by several 'Beds of Justice' (q.v.) to compel the registration of the edicts, and to forbid the opposition of the parliament, the latter did not on that account change its bearing towards the

court. Mazarin, therefore, adopted violent measures. On the 26th August 1648, he ordered the president, Potier de Blancmenil, and the councillor, Peter Broussel, to be arrested. The people took up arms, dispersed the Swiss guard, and on the 27th August (*la journée des barricades*), erected barricades in the streets around the Palais Royal. The court now yielded, repealed several taxes, and promised a better administration of justice. This victory gave parliament courage; those members who continued to keep a sharp look-out on the court measures, and were styled by the adherents of Mazarin *frondeurs*—i. e., censurers (literally, 'slingers')—formed the majority. The court now resolved to suppress the movement, in which the populace of the capital had also taken part, by force of arms, and, on the 6th January 1649, removed secretly to St Germain, leaving Paris to be blockaded by the Prince of Condé with 7000 men. The parliament, whose cause was now publicly espoused by the Prince of Conti, the Dukes of Longueville, Beaufort, Orleans, Bouillon, Elbeuf, Vendôme, Nemours, the Cardinal De Retz, and the Maréchal de la Mothe, called upon the people to resist, and even negotiated with the stadtholder of the Netherlands for an auxiliary corps. In this critical position, the court, on the 11th March, concluded a compact at Ruel, in which both parties missed their object. After the return of the court to Paris in August, a new turn was given to the contest, the princes of the blood disputing the power with Mazarin. This, on the 18th January 1650, led to the sudden arrest of Condé, Longueville, and Conti. This arbitrary proceeding roused the provinces. Marshal Turenne assumed the title of lieutenant-general of the royal army for the liberation of the princes, united himself with the Archduke Leopold, and took several fortified towns, but was finally completely defeated by Mazarin's troops at Rhetel, on the 15th December. Mazarin returned in triumph to Paris, but found all parties against him, and his removal was insisted upon so urgently, that he was obliged to release the princes, and flee to the Netherlands. A disgraceful system of intrigue was now substituted for force of arms, which totally changed the position of parties, and converted the contest which had begun for the interests of the people into a court cabal. Turenne was gained over by the queen-regent, De Retz by Cardinal Mazarin, and Condé was obliged to flee for safety into Guienne. Meanwhile, Louis XIV., who had now attained his 14th year, endeavoured to induce the Prince of Condé to return; but the latter, mistrusting these overtures, repaired to Bordeaux in 1651, where he had many adherents, whence he commenced a regular war against the court, which might have had dangerous consequences, had not Turenne opposed the prince. On the 2d July 1652, an engagement took place between the two parties in the neighbourhood of Paris. Condé was on the eve of being defeated, when the gates of Paris were opened to him by the courage and zeal of his sister, the Duchess of Longueville, and thus a new turn was given to the contest. Paris itself, weary of these fruitless dissensions, now entered into negotiations with the court, demanding the final removal of Mazarin, who had meanwhile returned. This demand was complied with by Louis XIV., and a general amnesty proclaimed. Condé, who refused to enter into the compact, relying upon an army of 12,000 men placed at his disposal by Charles, Duke of Lorraine, quitted Paris on the 15th October 1652, and repaired to Champagne; and finally, finding no one disposed to take up arms in his cause, entered the Spanish service, for which he was declared a traitor. Soon after, Mazarin returned to Paris, and was again intrusted with the reins of government.
Thus the royal power came forth victori
this long contest, which, though it seemed
mence for the popular interests, gradually
into a miserable party strife among th

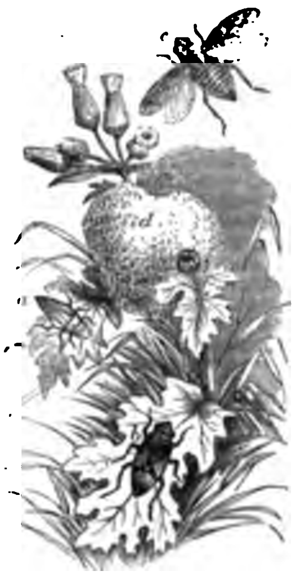
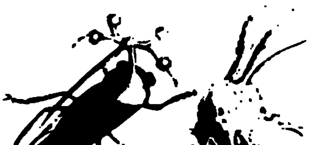
Y, FROTH-HOPPER, FROG- **G-HOPPER**, the common names of which the young larvæ and pupæ d in a frothy exudation on plants. They *Cercopidæ* of the order *Homoptera*, to *Aphides*, and still more nearly to Lantern-flies. The larvæ and pupæ in appearance from the perfect insect it possesses wings, which are four in number, and large. The frothy exudations in which they live are produced from the juices of the plants on which they are found; and as they are often in great numbers, crops of various kinds are not unfrequently destroyed or much injured by them, the plants being weakened by loss of sap. They have a proboscis adapted for piercing the bark of the plants on which they feed. They are all small insects. They have considerable leaping powers. *Cicada spumaria* is an extremely common species in Britain. The frothy exudation is sometimes called CUCKOO-SPIT, sometimes FROG-SPITTLE, from fancies entertained as to its origin. It is sometimes so abundant, particularly on willow-trees, that persons walking beneath are wetted by its continual dropping. In tropical countries, the *Cercopidæ* are still more plentiful. Some of the tropical insects of this family are remarkable for their extraordinary forms, resulting from peculiar developments of the first segment of the thorax. This is particularly the case in the genus *Boeydium*, of which two species are here figured.



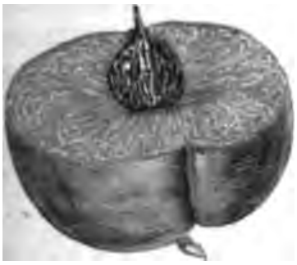
Frog-Hopper (*Cicada spumaria*):

a, larva; b, perfect insect, with wing covers closed; c, perfect insect, in the act of flight; d, the froth on a plant.



Boeydium Cruciatum. Boeydium Globulare.

FROUDE, JAMES ANTHONY, an English historian, was born at Totness, in Devonshire, in the year 1818; studied at Oriel College, Oxford, where he took his degree in 1840; and in 1842 was elected a fellow of Exeter College. Having abandoned his original intention of entering the church, he published, in 1847, a volume of stories, entitled *Th* a external to the proper integuments of the ripe fruit is called the *pericarp* (Gr. ; and *karpos*, fruit); and this, which nely in size and other characters, usually three layers, the outermost of which is *epicarp* (Gr. *epi*, upon); the middle one, (Gr. *mesos*, middle), or sometimes the r. *sarx*, flesh); and the innermost, the *endon*, within). These parts exhibit ty, but it is generally the mesocarp which succulent or fleshy, as in the peach, cherry, other drupes; and in the pear, apple, and pomes. In drupes, or stone-fruits, the endocarp hard shell which immediately covers the seed;



Drupe (section of a Peach).

it is the scaly lining of the seed-bearing in the centre; in both drupes and pomes, is the outer skin. So in melons, cucum- ourds, the succulent part is the mesocarp, eloped, with a thin epicarp and a thinner In the orange, however, and all of that epicarp and mesocarp together form the the pulpy cells belong to the endocarp. as the gooseberry, grape, &c., the pulpy not belong to any of the layers of the is formed from the placentas of the

fruit, as the fully developed ovary, is a modified leaf or leaves, the epicarp representing the epidermis of the lower endocarp the epidermis of the upper the mesocarp the substance (paren- leaf. The midrib of the leaf is traced *al suture* of the fruit or of each com- el, and the *ventral suture* is formed by gether and the conjunction of its edges. and ventral sutures are very obvious in of pease, beans, &c.; and even in fruits several carpels intimately combined, they e very apparent when the ripened fruit llow the escape of the seeds. The opening ce (Lat. *dehisco*, to open) of fruits takes rious ways; thus, the fruit sometimes into its original carpels by separation *dissepiments*, which divide into two ng the sides of the valves, and the r open by their sutures; the pericarp plits at once by the dorsal sutures of sometimes it divides transversely, and lid; sometimes it opens more partially Many fruits, however, are indehiscent. h are fruits having a very hard peri- and some are fruits having a soft uch pulp. The decay of the pericarp cases necessary to the liberation of the when this is accomplished by such the fruit becoming the food of animals, by seeds of plants are often widely dis- decay of the pericarp seems intended, to provide the first nourishment for plants which spring from the seeds.

A classification of the different kinds of fruits is extremely difficult, although they afford characters of great importance in descriptive and systematic botany. A convenient primary division of fruits is into those which are formed from one flower, and those which are formed by incorporation of the ovaries of many flowers. Fruits formed from one flower, by far the most numerous of these two classes, are divided into *apocarpous* and *syncarpous*, or into *apocarpous*, *aggregate*, and *syncarpous*. Apocarpous fruits are formed of one carpel, and are either dry or succulent, dehiscent or indehiscent, one-seeded or many-seeded. Aggregate fruits, sometimes included among the apocarpous, are formed of several or many free carpels; sometimes dry, sometimes succulent; sometimes arranged on a convex or elevated receptacle; which becomes succulent in the strawberry, and constitutes the edible part of the fruit; sometimes within a concave receptacle covered by the enlarged tube of the calyx, as in the rose. Syncarpous fruits are formed of several carpels, intimately united in their mature state, so as to form a berry, capsule, pome, silique, &c. Syncarpous fruits sometimes so completely resolve themselves into their original carpels, that these may be regarded as becoming separate achenia. Fruits formed by incorporation of the ovaries of many flowers (collective or anthocarpous fruits) are sometimes dry, as the cones of firs; sometimes succulent, as the pine-apple, the mulberry, and the fig. For further notice of different kinds of fruits, we must refer to particular articles in which they are described, as achenium, berry, capsule, drupe, nut, pome, pod, silique, &c., and to articles on the plants which produce them.

A few plants, particularly the *Coniferæ* and *Cycadaceæ*, produce seeds really naked or destitute of pericarp. Many other seeds were formerly often described as naked, in which the pericarp exists intimately incorporated with the seed, as the seeds of grasses, *Boragineæ*, *Labiatæ*, *Umbelliferæ*, &c. Their real nature is often made apparent by some trace of the style.

The production of ripe fruit is exhaustive to the energies of a plant, and plants ordinarily annual may be preserved in life for several years by preventing it. Very young fruit trees generally fail to bring fruit to perfection, and the first flowers of melons and gourds are often, for a similar reason, abortive; whilst, on the contrary, any circumstance that favours an accumulation of sap in a particular season, tends to render fruit-trees unusually productive in the next, as when the whole blossoms of a year are killed by frost, or when, from the coldness of the previous summer, flower-buds have not been formed in abundance. Whilst the vital energies of a plant are directed mainly towards the increase of its size, flower-buds are sparingly formed or not at all, as is often the case with fruit-trees growing very luxuriantly, and various modes are adopted to cause the production of flower-buds and of fruit by checking this luxuriance of growth, as by root-pruning, by cutting into the stem of wall-trees to a moderate depth, or by taking off portions of the bark of the stem. Grafting (q. v.) is also of use in this respect, as well as for the propagation of improved varieties of fruit-trees, the qualities of which would, in all probability, not be found exactly the same in their offspring by seed.

In a very immature state, fruits are in general green and soft, and decompose carbonic acid gas in the sunlight, absorbing the carbon, and setting free the oxygen, like leaves and other green parts of plants. As they advance towards maturity, some of them become externally dry and hard, and cease to perform by their surface these functions of

sition of fruits, Fresenius
depends (1) on the ratio in
to the sugar, gum, pectine,
ances masking the ratio
to the sugar); (2) on the presence and delicacy of the aroma; (3) on the proportions between the soluble matters, the insoluble matters, and the water; thus, we usually attach the highest value to those fruits which contain the largest amount of soluble, and the smallest amount of insoluble matters—a peach or a greengage almost melts in the mouth, because these fruits are relatively poor in cellulose and pectose; while, on the other hand, bilberries represent the opposite extreme, and are rich in insoluble ingredients; (4) on cultivation, which is found to cause an increase in the quantity of sugar, and a diminution of the amount of free acid and of insoluble matters; (5) and on favourable seasons, which augment the sugar and other soluble constituents.

The different berries contain, as a general rule, a larger proportion of free acid than stone-fruit or apples and pears; and their acidity is the more obvious to the taste from their containing relatively small quantities of gum and pectine. The following remarks on some of our common varieties of fruits are of practical value.

In *gooseberries*, we recognise an agreeable proportion between the sugar and the acid, the ratio being as 6 to 1 in the sweeter kinds, and 4 to 1 in less sweet varieties of this fruit. The yellow kinds are far richer in soluble ingredients than the red.

Currants are so acid to the taste, that they are almost always eaten with sugar; the ratio of the sugar to the acid being about 3 to 1.

In *strawberries*, it is the aroma that we chiefly prize. The ratio of the sugar to the acid varies with the season and the species from 2 to 1 to 6·7 to 1 (in the pine-apple strawberry).

A similar remark applies to *raspberries*. In wild raspberries, the ratio is as low as 1·8 to 1, while in cultivated kinds it is as high as 3·5 to 1.

Grapes exceed all other fruits in their amount of sugar, which is seldom less than 12, and sometimes reaches 26 per cent. In good kinds, and in favourable seasons, the ratio of the sugar to the acid is as 29 to 1; in inferior kinds, and in ordinary seasons, it is as 16 to 1; when the ratio falls to 10 to 1, the grapes are unripe and acid. In other fruits, this would be a high ratio, and they would be regarded as sweet. The anomaly may be thus explained. In unripe grapes, the skins are very thick, and contain an extremely acid juice, which overcomes the sugar contained in the interior of the berry. The juice of such grapes is found to be far sweeter than the grapes themselves.

From their large amount of sugar, and from the fact that their acidity for the most part depends on the acid tartrate of potash, which is almost entirely precipitated from the wine, grapes are incomparably superior to any other fruits in the preparation of wines; and in their fermentation, different varieties of ether of a delicate odour are formed, which, in association with volatile oils that are also present, communicate to the more valued wines their special *bouquet*.

The ratio of the acid to the sugar in the must (the expressed juice before the commencement of fermentation) affords the best evidence of the season. Thus, in the very bad wine-year of 1847, the ratio was 1 : 12; in the better wine-year of 1854, it was 1 : 16; while in the good wine-year of 1848 it was 1 : 24, the same kind of grape being experimented upon in all the cases.

Apricots and *peaches* consist almost entirely of juice, their solid constituents, after the removal of the stone, being only 1 or 2 per cent. These fruits are esteemed both for their juicy and tender flesh, and for their powerful but delicate aroma.

In *apples* and *pears*, we have an increased quantity of cellulose and pectine, and consequently a relative preponderance of the insoluble constituents. The cellulose contributes to the firmness or hardness of these fruits, while it is to the pectine that they owe their property of gelatinising when boiled. The well-marked differences of taste, &c., presented by different kinds of apples and pears, are due to the very varying relations that occur between the acid, the sugar, and the pectine, to the greater or less abundance of cellulose, and to the varying nature of the aroma. For equal quantities of sugar, pears contain less acid than apples. In the different kinds of dessert apples, the ratio of the sugar to the acid ranges between 12 to 1 and 22 to 1, while in cooking-apples it averages not more than 8 to 1.

The chemical changes which take place in the fruit during the process of ripening are described in the article PHYSIOLOGY, VEGETABLE.

Keeping of Fruit.—Many of the finest fruits undergo very speedy decomposition; and on this account, some of those most highly esteemed in the countries which produce them, have never become articles of commerce, and are only to be enjoyed—except in the state of *jam* or *preserves*—during the season of their ripening. Decomposition takes place most rapidly when fruits are exposed to the air, and particularly to stagnant air, when there is any dampness about them, and when they are subjected to considerable or frequent changes of temperature. Grapes are imported into Britain from the south of Europe, packed in saw-dust. Unripe gooseberries are kept for making tarts in winter, in bottles or jars, filled up with perfectly dry sand, saw-dust, bran, or the like, closely corked and sealed, after a gentle heat has been applied to expel moisture as much as possible, and placed in a moderate and equable temperature, which is sometimes accomplished by burying them to some depth in the earth. A similar method may be employed with many other fruits. Pears, the finest kinds of which are very apt to rot almost immediately after they reach their perfect maturity, may be kept for months in glazed earthen-ware jars very closely covered, and placed in a cool airy situation, out of the reach of frost. The layers of fruit are separated by the substance used for filling up the interstices, and the pears of the same layer are likewise kept apart, that rottenness in one may not infect the rest, which, with every kind of fruit, is very apt to take place. Another method is to keep them in drawers, the temperature being carefully regulated. Large gardens are often provided with a fruit-room, in which shelves and drawers are allotted to the different kinds of fruit. A moderate and equable temperature, dryness, and careful ventilation, are the principal requisites of the fruit-room. Fruit intended for keeping should be carefully gathered, when almost quite ripe, and all bruising avoided. Pears or apples shaken from the tree cannot be expected to keep so well as those gathered by the hand. Of all the succulent fruits produced in Britain, the apple keeps best, and is therefore most generally used. Fruit intended for keeping is sometimes *sweated* before being placed in the jars or shelves; being laid in heaps for a short time—varying according to the kind of fruit, and extending, in the case of winter-apples to a fortnight or more—that some of the juice may exude through the skin; but the propriety of this practice is doubtful. Some kinds of winter pears and apples can scarcely be said to be ripened till after they are placed in the fruit-room; and medlars are not fit for use till they have reached a state of incipient decay.

FRUIT-GARDEN. Some kinds of fruits have been cultivated from the earliest historic ages. To say nothing of the garden of Eden, and the vineyard which Noah planted after the Deluge, we find in the books of Moses evidence that the cultivation of fruits was much practised in Egypt before the time of the exode of the Israelites; and amongst the Babylonians, the Persians, the Chinese, and the inhabitants of India, it can in like manner be traced back to the most remote antiquity. The Greeks and Romans probably derived their knowledge of the art, as well as many of their finest varieties of fruit-trees, from the East; Charlemagne required attention to be paid to it throughout his wide dominions, and contributed much to its extension in regions of Europe previously too rude for its prevalence; and during the middle ages it was most successfully prosecuted by the monks in the gardens of the monasteries.

The grape, the fig, the melon, and the pomegranate, are among the first fruits of which we find any particular notice in history. The cultivation of the apple, the pear, and some others, is also unquestionably of very great antiquity. Interesting particulars concerning the most important kinds of fruit, will be found under their respective heads.

The cultivation of fruits is generally carried on in connection with that of culinary vegetables, flowers, and other objects of the gardener's care; and the fruit-garden is almost necessarily more or less combined with the kitchen-garden, &c. The term fruit-garden is generally used when the ground between fruit-trees is regularly tilled and made to produce other garden crops; the term Orchard (q. v.), when it is laid down in grass, or cultivated for grain and other agricultural crops. The latter method is practicable only with some, and these the more hardy kinds of fruit-trees.

Fruit-trees, in the open air, are cultivated either as wall-trees, espalier-trees, or standards. The walls intended for fruit-trees are either of brick or stone, the former, however, being preferable, and are generally from ten to fourteen feet high. Walls serve not only for protection from winds, but for the radiation of heat, and thus counterbalance in part the disadvantages of cold climates. The training of wall-trees will be noticed in a separate article. See WALL-TREES. Espaliers (q. v.) serve in an inferior degree the purposes of walls. Walls are sometimes flued and artificially heated, by which means early ripening is secured, and varieties of fruit are produced which could not otherwise in the same locality be grown in the open air. The production of fruits belonging to warm climates is effected in the colder parts of the world by [illegible] of Hothouses (q. v.), in which the trees are [illegible] trained either as wall-trees or on frames [illegible] almost horizontally, both methods being [illegible] adopted in the same hothouse. Standards [illegible] which receive no other training than mere [illegible] or the occasional tying of a principal [illegible] guide it in a particular direction, are further

FRUIT-PIGEON (*Carpophaga*), a genus of *Columbidæ* (q. v.), having the bill considerably depressed at the base, compressed and moderately arched at the tip, the membrane in which the nostrils are pierced little prominent or swollen, the forehead low, and the feathers advancing on the soft part of the bill, the wings moderately long, the feet, and particularly the hinder claw, large, and formed for grasping. During the breeding season, a curious gristly knob grows on the base of the upper mandible of some of the species, and soon after disappears. They are birds of splendid plumage, natives of the forests of India, the Indian Archipelago, the warmer parts of Australia, and the islands of the Pacific Ocean. Their food consists of fruits.

Fruit Pigeon (*Carpophaga Oceanica*).

FRUITS, in Law. The fruits of the soil, in their legal aspects, fall under various categories, and follow different destinations according to their nature, and the situation in which they are placed. If not yet separated from the soil which produced them, they are said to be *pendentes*, and as parts of the soil (*partes soli*), pass to the heir on the death of the ancestor, or are carried by a sale to the purchaser. To this, however, there is an exception in the case of industrial fruits (*fructus industriales*), such as growing corn, and all those other fruits which require yearly seed and industry. These are called in England *emblements*, and 'though still in union with the soil, follow nevertheless, in several particulars, the nature of personal, as distinguished from real estate.'—Stephen's *Com.* ii. 227. The rule is the same in Scotland, but it is strictly construed, and does not include trees or planting, natural grass, or even fruit not yet plucked from the tree. To this again, however, there is an exception in horticultural subjects, in favour of nursery-trees and plants, not of larger or longer growth than such as are usually dealt in by nurserymen. See FIXTURES. Fruits that are separated from the soil (*fructus percepti*), on the other hand, are the property of the possessor who separated them in good faith; of the tenant or former proprietor in the case of a sale; and of the personal representatives of the deceased in case of death, and not of the heir of his real or heritable estate.

The act 7 and 8 Geo. IV. c. 30, 'for consolidating and amending the laws of England relative to malicious injuries to property,' applies to trees, saplings, shrubs, and underwood; to plants, fruits, and vegetable productions in gardens, orchards, nursery-grounds, hothouses, green-houses, or conservatories; and to various kinds of cultivated roots and plants not growing in a garden, orchard, or nursery-ground. The punishments are proportioned to the injury done, whipping in certain cases being added to the statutory punishments in the case of males, by 16 and 17 Vict. c. 99, and 20 and 21 Vict. c. 3. This statute (7 and 8 Geo. IV. c. 30) is limited to England, but there is an Irish statute in some respects corresponding to it (16 and 17 Vict. c. 38). In Scotland, the trees of an orchard fall under the act for preserving planting (1698, c. 16), and several still earlier enactments; and the breaking of orchards is an offence punishable by the sheriff (Ersk. i. 4. 41). See ORCHARD, PLANTATION. Injuries done to trees or other fruits of the soil are punishable at common law, independently of all statutory provisions, as malicious mischief, both in England and in Scotland.

FRUIT-TRADE. The trade in fruit is divided into two distinct branches—the *fresh* and the *dried* fruits. Fresh fruits, such as those which grow abundantly in England, are sold for London consumption almost entirely at Covent Garden Market; the sales at the Borough and other metropolitan markets being comparatively small. There are many fruit-gardens within twenty miles of the metropolis which depend almost wholly on London consumption; but since the extensive spread of railway accommodation, fruit can now be brought up from distant parts of England with great facility; and provincial towns and the metropolis can alike be well supplied. Rapid conveyance and prompt sale and delivery are essential conditions to this kind of trade, owing to the tendency of the fruit to spoil by keeping. The higher the quality of the fruit, the more certain is the sale in London. There are in the island of Jersey pear-orchards, the produce of which is contracted for at very high prices by some of the Covent Garden dealers. The orange and lemon trades are managed in rather a peculiar manner; the produce is brought to England in very small vessels, and is mostly consigned to fruit-merchants in the neighbourhood of Lower Thames Street, who sell it to the fruiterers and the street-dealers, as well as to the markets.

[illegible] comprises raisins, currants, figs, and the like, grown and dried in foreign countries. [illegible] bordering on the Mediterranean, these kinds [illegible] mostly arrive in cases and casks; and the [illegible] connected with them are conducted much [illegible] way as those with what is called colonial [illegible] such as grocery.

[illegible] currants, oranges, and lemons, the [illegible] imported into the United Kingdom in [illegible] were as follows:

[illegible]	£[illegible]243
[illegible]	[illegible]389
[illegible]	1[illegible]123

W[illegible] year, but it was [illegible] branch [illegible] tables [illegible] numbers [illegible] 34,744 [illegible] 19,857 [illegible] pears, [illegible] cwts., prunes, [illegible] cwts., tama[illegible]

Some years ago, statistical papers in the *Chronicle* gave returns concerning the qua fruit sold in Covent Garden and other markets annually, estimated in the usual bushels, cwts., pottles, &c. About the same Mr Braithwaite Poole, goods-manager London and North-western Railway, gave t the amount, estimated in tons, of the fruit to London generally. The sources of info are not very clearly stated in either case; the two accounts are inconsistent one with a they need not be given here.

FRUMENTIUS, ST, apostle of Ethiopia Abyssinians, born in Phœnicia towards the ning of the 4th century. At a very early and another youth, named Œdesius, accom their uncle Meropius, a Greek philosophe Tyre, on a voyage undertaken for mercant according to others, for scientific purposes their return, they landed on the coast of sinia or Ethiopia, to procure fresh water; b savage inhabitants, under the pretext of hostility with the Romans, made an ons upon them, and murdered Meropius and the crew, sparing only the two boys, whom they sitting under a tree and reading. They were as slaves into the service of the king made themselves so beloved that Œdesius raised to the office of cupbearer, while sagacious F. became the king's private and accountant. After the death of the F. was appointed instructor to the young P Aizanes, and in this capacity he obtained a greater influence on the administration of state affairs. He aided the Christian merch who sought these parts, in founding a church, gradually paved the way for the formal introduc of the new creed. In 326, he went to Alexandr Œdesius having returned to Tyre, where he made presbyter—and convinced Athanasius, had recently been nominated Bishop of Alexa of the necessity of appointing a special eccles dignitary for Abyssinia, who should carry out ously the work of conversion. Athanasius, a synod, and with its unanimous approbation, c crated F. himself Bishop of Axum (Auxuma new bishop repaired to Abyssinia, and succe proselytising large numbers. He is also to have translated the Bible into Ethiopi ETHIOPIA. On his subsequent theological tions with Theophilus the Arian—F. himsel in all probability an Athanasian—we cannot here. F. died about 360, and his day is cel by the Latins on the 27th of October, by the on the 30th of November, and by the Abys on the 18th of December.—Socrates, i. 15; *Hist. Eccl.* i. 9; Theodoret, i. 22; Ludolf, *Æth.* iii. 7. 17. &c.

first volumes of this truly national
been repeatedly published, and have
d into almost all European languages:
into English by Schoultz (2 vols.,
and into German by Homberg (2 vols.,
The part devoted to the history of
lphus has also been translated into
r Homberg (2 vols., Leip. 1842 1843),
by Mlle. N. du Puget (Paris, 1839),
and into Dutch by Radijs (Utrecht, 1844); and that devoted to the history of Gustavus Vasa into German by Ekendahl (1831). F.'s *Characteristics of the Period from* 1592 *to* 1600 *in Sweden* obtained a prize offered by the Swedish Academy. Another work, entitled *Om Aristokrat-fordömandet i Svenska Historien* (4 vols. Upsala, 1845–1850), in which he endeavours to clear the Swedish aristocracy from the accusations urged against them by Geijer and others, involved him in a keen controversy with the democratic liberal party in Sweden. F. has also addicted himself to poetry and music; and an opera of his, called *Wermland's Flickan* (or 'The Lass of Wermland'), has proved very attractive to his countrymen, on account of its fine national melodies.

FUAD-MEHMED, Pasha, a Turkish statesman and litterateur, was born at Constantinople in 1814. He was the son of the celebrated poet, Izzet-Effendi-Kitchegizadé, better known under the name of Izzet-Mollah, and nephew of Leila Khatun, one of the very few Turkish poetesses. Having received an education more literary than that of the majority of young men destined for public affairs in Turkey, he began to make himself known as an author, when the exile of his father, who had fallen into disgrace with the Sultan Mahmud, and the confiscation of the paternal property, compelled him to choose a profession. He betook himself to medicine, and studied at Galata-Sérai from 1828 to 1832. In 1834 he was appointed Admiralty physician, and accompanied the grand admiral in his expedition against Tripoli; but on his return to Constantinople, he abruptly forsook medicine, and entered the more unquiet arena of politics. For several years, he employed himself in the study of diplomacy, history, modern languages, the rights of nations, and political economy. In 1840, he became first secretary to the Turkish embassy at London, where his skill and sagacity first made themselves conspicuous. In 1843 he was named second dragoman of the Sublime Porte, and shortly after was chosen to proceed to Spain to felicitate the queen of that country on her accession to the throne. F. was very popular at the court of Madrid. It was almost impossible to believe him to be a Turk. He spoke French marvellously well, made *bon-mots* like Talleyrand, and shewed himself as gallant as an Abencerrage. Curiously enough, although a *Mohammedan*, he obtained, while in Spain, among other honours, the Grand Cord of Isabella the *Catholic*. Here also he composed a poem on the Alhambra, which Turkish critics praise highly for its novel and interesting reflections. On his return to Constantinople, he was appointed to discharge the functions of grand interpreter to the Porte, which brought him into contact with the Duke of Montpensier, who arrived at Constantinople in 1845, and who, on his return to France, invested him with the cross of Commander of the Legion of Honour. In 1850 he went on a mission to St Petersburg, and in 1853 on another to Egypt. On his return from the first of these, he became minister of foreign affairs under the grand viziership of Aali Pasha (August 1852). On the question of the 'Holy Places,' F., by his attitude, and by a brochure very hostile to the pretensions of Russia, entitled *La Vérité sur la Question des Lieux Saints*, gave great dissatisfaction to the czar. In 1854, F. went to Epirus along with Omar Pasha, acting sometimes as a diplomatist and sometimes as a general. In the following year he received the title of Pasha, and was again appointed minister of foreign affairs (From 1861 to 1866 he held the office of Grand Vizier. He died 1869.) To him especially it is said Turkey owes the hatti sherif of 1856, ordering the species is employed in their dyeing black. The genus is of Leonhard Fuchs, one of the botany, born in Swabia in 1501, where he was a professor, in 1565.

LUBLE GLASS is a peculiar prepared by melting together 8 nate of soda, or 10 parts of carbonate 15 of pure quartz sand, and 1 part of is added to facilitate the decom- alkaline carbonate. A black glass is which is not soluble in cold water, about six times its weight of boiling ommenced his experiments on this and has continued and varied them above is, however, we believe, the formula. The practical uses of the to which he especially directed his two—viz. (1), as a varnish, which, l form to stone surfaces, would , and prevent the ordinary effects fluences; and (2) as a means of olours by the process known as At the request of the late Prince chs gave a summary of all that he department in a paper which he Society of Arts in 1859. See

ioned that Professor Kuhlmann of working at the same subject; hed his method of producing a cate; and that our own country- of Inswich, has not only employed of silicate of potash, or of consolidating silicious sand ble, artificial sandstone, capable, being moulded into any desired produced a vitreous varnish, of potash, after which he lution of chloride of calcium: thus formed, which is stated l in protecting the surface of ence. Wood that has been ieties of soluble glass is t quite fire-proof.

FUCACEÆ and WRACK.

term is generally applied to com- production of heat; also, less les such as oil, Paraffine g. Under articles COAL, details of the physical composition of the various observations bear chiefly on application as sources of motive

The two elementary bodies to which we owe the heating powers of all our fuels, natural and artificial, are carbon and hydrogen. Coke, wood charcoal, peat charcoal, and anthracite, contain little or none of the latter element, and may be regarded as purely carbonaceous fuels. But wood, peat, and most varieties of coal, contain hydrogen as well as carbon; and in their combustion, these two substances combine to produce volatile and combustible hydrocarbons, which are volatilised previous to being consumed, while a purely carbonaceous fuel evolves no volatile matter until combustion has been effected.

These hydrocarbons are numerous and varied in composition (see CARBOHYDROGENS); but when combustion is perfect, the amount of heat produced by any hydrocarbon is exactly what would have been produced had the hydrogen and carbon been burned separately. It will be of advantage, therefore, to study these two elementary combustibles in succession, in order to estimate subsequently the combined effect where they come together in the same fuel.

The heating power of a combustible, or the *amount* of heat generated by it, is usually expressed in degrees Fahrenheit on so many pounds' weight of water. But in estimating the *temperature*, or intensity of heat produced, we have to keep in view that different substances have different capacities for heat, that of water being generally assumed as unity. The number expressing this capacity is called the specific heat of the substance. Water 1000, carbonic acid 221, imply that while 1000 units of heat are required to elevate the temperature of water any given number of degrees, only 221 units are required to elevate to the same temperature an equal weight of carbonic acid.

CARBON AS FUEL.—1. *Amount of air required for combustion.*—Burned in air, carbon combines with the oxygen to form carbonic acid (CO_2), mingled with nitrogen, the other atmospheric element. The chemical change may be thus represented, atomically:

			Products of Combustion	
Carbon,		60		
Air 696	Oxygen,	160	Carbonic acid,	220
	Nitrogen,	536	Nitrogen,	536
		756		756

Or, assuming carbon as unity:

Carbon,		1·00		
Air 11·6	Oxygen,	2·67	Carbonic acid,	3·67
	Nitrogen,	8·93	Nitrogen,	8·93
		12·60		12·60

Carbon, therefore, requires about twelve times its own weight of air for perfect combustion.

2. *Amount of Heat produced.*—Andrews found that 1 lb. carbon produced heat equal to 1° F. in 14.220 lbs. of water. Other observations agree very closely. This may be otherwise stated thus: 1 lb. carbon will raise from freezing to boiling point (32° to 212° = 180°) $\frac{14220}{180}$ = 79 lbs. water; from mean temperature to boiling-point (60° to 212° = 152°) $\frac{14220}{152}$ = 93·5 lbs. water; will boil off in steam from mean temperature (60° to 212° = 152°, add latent heat in steam, 965° = 1117°), $\frac{14220}{1117}$ = 12·73 lbs. water; and will boil off in steam from boiling-point (latent heat in steam, 965°) $\frac{14220}{965}$ = 14·74 lbs.

3. *Utmost Temperature or Intensity of Heat from Carbon.*—Here we suppose the combustion effected in a space enclosed by non-conducting material, so that all the heat produced by 1 lb. carbon is

retained by the products of its combustion. Caloric sufficient to raise 14,220 lbs. water 1° F. is thus compressed, as it were, into 12·6 lbs. of carbonic acid and nitrogen. To determine the temperature thus produced, we require to know the specific heat of this gaseous compound, that of water being 1.

3·667 lbs.	carbonic acid.	Specific heat,	·2210
8·933 "	nitrogen.	" "	·2754
12·600 "	products of combustion.	Mean sp. "	·2596

14,220° on water at 1·000 specific heat, will give 54,776° on these products per pound-weight. Distributed over 12·6 lbs., this heat will raise the temperature to $\frac{54776}{12\cdot6} = 4347^\circ$ F., which is therefore the utmost intensity of heat attainable in burning carbon, supposing no loss by absorption or radiation.

4. *Effect of Excess of Air.*—Excess of air has been proved to have no effect on the *quantity* of heat produced where combustion is perfect; but the intensity of *temperature* is diminished. Suppose two equivalents of air admitted; we then have as the products of combustion—

3·667 lbs.	carbonic acid.	Specific heat,	·2210
8·933 "	nitrogen.	" "	·2754
11·600 "	air in excess.	" "	·2669
24·200 "	products.	Mean sp. "	·2631

14,220° on water = 54,048° on this new mixture of gases. But the heat is now diffused over 24·2 lbs. matter instead of 12·6 lbs., $\frac{54048}{24\cdot2} = 2347^\circ$ F.: the utmost temperature produced by carbon burned in two equivalents of air.

The utmost temperatures attainable, with various proportions of air, are given below, and also the appearance which the interior of the furnace would exhibit. Flame at these temperatures will present the same differences in colour.

Weight.		Ratio of Fuel to Air.	Highest Possible Temperature.	Appearance of a Body exposed to such Temperature.
Carbon	Air.			
lbs.	lbs.			
1·	11·6	1 to 1	4347°	Intensely brilliant.
1·	17·4	1 " 1½	2951	Dazzling white.
1·	23·2	1 " 2	2233	Bright ignition.
1·	29·0	1 " 2½	1797	Full cherry red.
1·	34·8	1 " 3	1503	Commencing cherry red.
1·	58·	1 " 5	908	Incipient red.
1·	69·6	1 " 6	758	Black.

5. *Effect of Deficiency of Air.*—If, before reaching the upper layers of carbon or cinder, the air has parted with all its oxygen to form carbonic acid with the production of heat, then the carbonic acid combines with part of the remaining carbon to form Carbonic Oxide, CO (q. v.), but without producing heat. The loss may amount, therefore, to one-half of the fuel: some have stated it as high as three-fourths. If this oxide, when it gets above the fuel, meet with air before cooling, it burns with a pale blue flame, restoring part of the lost heat; but to what extent has not yet been determined.

6. *Effect of Water Present.*—Passing into vapour, water absorbs both sensible and latent heat, and thus diminishes the temperature. Heating power is also lost, as products of combustion are generally passed into the atmosphere at a high temperature.

HYDROGEN AS FUEL. 1. *Air required.*—Hydrogen combines with the oxygen of the air to form vapour of water, mingled with nitrogen:

			Products of Combustion.	
Hydrogen,		1·		
Air (34·8)	Oxygen,	8·	Vapour of water,	9·
	Nitrogen,	26·8	Nitrogen,	26·8
		35·8		35·8

1 lb. hydrogen therefore requires 34·8 lbs while 1 lb. carbon requires only 11·6 lbs.

2. *Amount of Heat Produced.*—The amou heat produced from hydrogen is much g than that from carbon; the caloric from heating 60,840 lbs. water 1° F. Part of th however, latent in the water-vapour, and mu deducted in calculating intensity of heat, and heating effect under all ordinary circumsta This deduction amounts to 9 lbs. water latent = 8685°, leaving 52,155° as the eff heating power of 1 lb. hydrogen.

3. *Utmost Temperature or Intensity of Heat.*— is *less* than in the case of carbon, from the specific heat and greater quantity of the prod We have—

Vapour of water,	9· lbs.	Specific heat,	
Nitrogen, . .	26·8 "	" "	
	35·8 "	Mean sp. "	

52,155° on water will be 124,445° on these produ and $\frac{124445}{35\cdot8}$ lbs. = 3476°, is the utmost pos temperature.

4. *Effect of Excess of Air.*—As in the case of car the intensity of heat is diminished, as under:

Weight.		Ratio of Fuel to Air.	Highest Possible Temperature.
Hydrogen.	Air.		
lbs.	lbs.		
1·	34·8	1 to 1	3476°
1·	69·6	1 " 2	[illegible]
1·	104·4	1 " 3	1591
1·	139·2	1 " 4	[illegible]

5. *Effect of Deficiency of Air.*—No new prod is the result of deficiency of air, as in combustion carbon; the hydrogen simply escapes unconsume

6. *Effect of water-vapour present* is diminution intensity and ultimate loss of heat in application, in the case of carbon.

Temperature of Ignition of Carbon and Hyd —These substances must be themselves h before they can burn. Hydrogen begins to at or below 300°, while carbon requires a red h (800° to 1000° F.), and even at that tem burns very slowly. Consequently, where combined, as in common coal, the te present is often sufficiently high to ig consume the hydrogen, while the carbon unchanged as cinder, or passes away as unconsumed in either case.

All that has been said above, of carbon, as air required, heating power or value, utmost t perature, temperature of ignition, effect of w present, and of excess or deficiency of air, app without modification, to one class of fuels— purely carbonaceous, including anthracite, from coal, charcoal from wood and peat, and cinder of any description of fuel. The bustible ash must be allowed for in cal heating power or value; and also the bodies—nitrogen, sulphur, &c.—the latter of frequently renders the fuel unsuitable for purposes in the arts and manufactures.

Peat, wood, and coal, with the except anthracite, contain hydrogen to an extent exceeding 5 per cent. We have seen tha pared with carbon, hydrogen requires three much air, and generates nearly four times heat, but produces 20 per cent. less inte heat, and ignites at a much lower tem and the combustion of wood, coal, &c., is respects modified according to the pro hydrogen present in them.

wing table shews the composition of , as determined by Playfair and De la Beche. Columns 8 to 12 are added to illustrate the process of combustion.

coal is heated in a retort, it yields volatile ons (q. v.), amounting to 20 to 32 per cent. ht (see column 11). The hydrogen has fuel of six times its own weight of en fresh fuel is added to live coal in the same result ensues; so that in using o 67 per cent. of carbon burn on the grate, o 32 per cent. carbon and hydrogen have urned in the open space above the fuel, or unconsumed.

elements of a hydrocarbon are consumed, eously, but in succession. First, the separated from the hydrogen in light particles, subsequently seen as soot or not consumed); then the hydrogen burns, unicates heat to the carbon particles, appear as flame. The colour of the ates the temperature present; and if the is sufficiently high, the carbon of flame is composed burns also, producing rease of heat. If not, the flame, as it ard, cools, becoming red, dull red, and k and smoky, passing away as such. For bustion of common coal, we therefore nly air in sufficient quantity, but also heat above the fuel. We require a low to separate the carbon from the hydro r temperature to consume the hydrogen; higher to consume the carbon of the ed furnaces, such as those of steam- the current of air supplied continues in quantity, the volatile bodies are t immediately after fuelling; and , for the moment, perhaps four times of air which is passing through. The is in consequence of the want of air, tly unconsumed; and the tempera- ces is frequently too low for the as may be seen from the colour e cold boiler having abstracted the e flame has been subjected to its refer to the article SMOKE, CON- y, for an account of the plans which adopted to secure perfect combustion, prevent smoke. From the principles e should expect most success where the ied by mechanical arrangements as uniformly as the air, and where, in body of the furnace is protected or air from boiler-surface and other cooling necessary to maintain a temperature ient for the thorough ignition of the se-fires, where the heat is lost if not ward into the room, the cinders should the front, and the fresh fuel laid into space behind. The gases rise between being highly heated, form a sheet of flame above and behind the red-hot fuel in front. If, as is commonly done, we throw the fresh fuel on the top of the live coal, we interrupt the process of radiation, and the gaseous part of the fuel is thrown off rapidly into the cool atmosphere above the grate, and does not take fire until a considerable period has elapsed. To our ordinary fire utensils, we might with advantage add one of a rake shape, suited for drawing forward the fuel.

For dimensions of furnaces, &c., see STEAM-ENGINE.

Economy of fuel will be best secured, first, by accomplishing perfect combustion both of the fixed and volatile parts of the fuel; and secondly, by regulating the amount of air, as any excess of this has to be passed on to the chimney at the same high temperature as the true products of combustion.

The abundance or scarcity of fuel has a great effect on the general interests of a country and the comfort of its inhabitants. The wealth and prosperity of Britain must be attributed in no small degree to the abundance of coal in those districts both of England and Scotland in which ironstone is most abundant, and in which, therefore, the coal is required as fuel for smelting it. But even for the most ordinary uses of domestic economy, the scarcity of fuel in some parts of the world causes much hardship to their inhabitants, whilst its abundance in others is one of their greatest natural advantages. Coal, wood, and peat are the three kinds of fuel principally used; coal being indeed the vegetation of former ages—or rather of former geological periods—the product of their sunshine and their showers, treasured up for the present; peat, a recent formation. Coal may be said in general to be of about twice the value of wood as fuel, weight for weight, in its heating power. In those parts of the world in which coal is not found, or to which it cannot be easily—or as yet profitably—conveyed, the preservation of forests is of great importance; and trees are not unfrequently planted, as in some parts of Europe, in hedgerows and otherwise, chiefly in order to provide a supply of fuel. For the same reason, pollarding is resorted to, the branches being used as fuel, and the trunk left to produce new branches. Only some kinds of trees are adapted to this mode of treatment. In some regions, as on some of the steppes of Asia and other treeless plains, the dried dung of herbivorous animals is much used as fuel. In cases of less extreme necessity, all kinds of vegetable refuse are used. Thus, in many parts of the continent of Europe, things are carefully gathered up for fuel which in any part of Britain would most probably be burned on the field, to get them out of the way. But it is not easy to compute the benefit derived by many parts even of Britain, particularly the inland parts, from the recent great increase of the facilities of communication and of the trade in coal.

FUENTE DE OVEJUNA (The Sheep-well), a small walled town of Spain, in the province of Cordova, and 44 miles north-west of the town of that name, is situated on the crest and sides of a conical hill, between two of the upper branches of the Guadiata. At the foot of the hill, and on its western side, are the wells from which this town has derived its name. It has manufactures of linens, woollens, and leather. Coal-seams occur in the vicinity. Pop. about 5500.

FUE'NTES DE ONORO (The Fountains of Honour), a small village of Salamanca, Spain, on the Portuguese frontier, 14 miles west of Ciudad Rodrigo, is well known as the scene of one of the important battles of the Peninsular War, between the English under Wellington, and the French under Massena. Wellington, who had resolved to abide battle, drew up his forces between the Coa and the Agueda, his line extending north and south for about seven miles, and his right wing stretching two miles south of F. de Onoro. On the 3d May 1811, this village was fiercely attacked by a strong body of French troops, who forced the English from the streets, and were not dislodged until the English, reinforced by three regiments, drove them by a terrific charge from their position, with a loss in all of 300 men. On the 5th, the battle proper commenced. The French, much stronger than their enemies both in cavalry and infantry, assailed Wellington's right with overwhelming numbers, and although prodigies of valour were performed by the English—as in the case of Ramsey's brigade of horse-artillery, which cut its way through a solid body of cavalry—their right wing was turned, and their position lost. Never during the war were the English forces more perilously situated. Meanwhile, at F. de O., on which Wellington's *left* wing now rested, a fierce battle was being fought. The three English regiments who had been left in occupation made a desperate resistance against assailing multitudes. The fight lasted here till evening, reinforcements having been brought up on both sides; and the night closed upon the English holding the crags above the town, and the retiring regiments of the French. The loss of the allies amounted to 1500, while that of the French was stated at the time to be nearly 5000, and was certainly greater than that of the allies. Neither army could claim a decided advantage in this battle; but its result was, that on the 10th, the French were forced across the Portuguese frontier; and thus ended the French invasion of Portugal.

FU'ERO, a Spanish word derived from Lat. *forum*, signifies strictly, the seat of justice, jurisdiction. In this last sense, it was transferred to collections of laws, and specially to the civic rights granted by the kings to individual cities, the most famous of which were the fuero of Leon and that of Naxera. As these city charters contained for the most part special liberties, concessions, and privileges, the word fuero became current chiefly in this sense, and was particularly so applied to designate the body of privileges and liberties that made up the constitution of Navarre, and of the three Basque provinces of Biscaya, Alava, and Guipuzcoa. These are the fueros the maintenance of which gave rise to wars in the Basque provinces in 1833. The fueros of other provinces and cities of Spain have been long extinct.

These Basque fueros are grounded on the old laws of the Visigoths, and grew up in the period between the irruption of the Moors into the Spanish peninsula and the consolidation of the Spa monarchy under the House of Hapsburg. The s was the case in the half-Basque province of Nava which formed an independent kingdom under own sovereigns. The fueros are thus the product the ancient Gothic laws—those fertile sources modern rights—and the new circumstances in wh they were placed. They resulted by degrees, here elsewhere, in a struggle between the people and princes; and their development forms an interest chapter in the history of modern constitutionali They were at first only privileges and statut rights granted to single places, and from th were extended to others. By the introduction of representative element of the Cortes, and extens over whole provinces, they were then transformed, virtue of the general law of custom, into consti tional rights of these provinces; and were in ti collected and formally embodied and sanctioned such. It was in this way that the fueros of Navar which had been growing into consistency for ce turies previously, were, in 1236, during the con between King Theobald and his Cortes, colle and recorded, and remain yet under the *Cartulario del Rey Tibaldo.* Ferdinand the C who united Navarre with the crown of [illegible] maintained the fueros, adapting them to [illegible] relation to Castile. Their leading provi [illegible] these: The Cortes, chosen for three years, [illegible] sisting of the three estates of clergy, nobles, a commons, are to meet yearly; and without the consent, no law can be passed, or anything of impor ance undertaken. The government consists of th viceroy, who presides in the Cortes and Great Council the Great Council of Navarre (a body similar to th old French parliaments); and the Contaduria, befor which all accounts of revenue and expenditure mus be laid. There is no custom-house or toll but at th frontier, and except the trifling grant of 176,00 reals, nothing flows into the royal treasury. A these fueros the king must bind himself by a roy oath to maintain.

In the lordship (Señorio) of Bisca [illegible] grew up in the contests of the inh [illegible] their counts. They were first collected [illegible] by Count Juan in 1371, which, after th [illegible] of Biscaya with Castile, was recast (1 [illegible] and confirmed by King Charles I. [illegible] emperor Charles V.). According to [illegible] rights, every new 'Lord'—for only [illegible] ans style the king of Spain as their pri [illegible] years old, must come into the country [illegible] and take the oath to uphold the [illegible] places appointed for that purpose. [illegible] consists of a corregidor, appointed [illegible] and two deputies; these, aided by [illegible] and forming the regimiento, co [illegible] tion. But the supreme power [illegible] Assembly (Junta General), whi [illegible] the tree at Guernica, and [illegible] the lordship, and app [illegible] dores. Justice is ad [illegible], in the first by the lieutenants ([illegible] of the corr [illegible] the second, by the corr [illegible] and deputies, the third, by the royal [illegible] at Valladolid. [illegible] privileges are, that every [illegible]cayan of [illegible] counted noble; that exce [illegible] the [illegible] to be no royal governing board [illegible] Biscayans are not bound to [illegible] in [illegible] army, nor to receive Spanish [illegible] Alava and Guipuzcoa are [illegible] character, but differing in d [illegible] were almost entirely abolishe [illegible] were restored by Queen Isabella [illegible] SPAIN.

Algiers in 1535, they received the right of coining money. Antony F., at his death, left six millions gold crowns in ready money, besides jewels and possessions in all parts of Europe and in both Indies. It is of him that the Emperor Charles is said to have remarked while being shewn the royal treasury in Paris: 'There is a linen-weaver in Augsburg that could pay all that out of his own purse.'

The Emperor Ferdinand II. raised the splendour of the House of F. still higher while confirming the imperial letter of Charles, by conferring great additional privileges on the two oldest of the family, Counts John and Jerome. The Fuggers continued still as nobles to carry on their commerce, and further increased their immense wealth. They attained the highest posts in the empire, and several princely houses prided themselves on their alliance with the House of Fugger. They possessed the most extensive libraries and collections of objects of art, maintained painters and musicians, and liberally encouraged art and science. Their houses and gardens were master-pieces of the architecture and taste of the times. There is thus nothing incredible in the story that Antony F., on one occasion when Charles V. was his visitor, lighted a fire of cinnamon wood with the emperor's bond for money lent him.

While thus indulging in splendour, they were not less bent on doing good. Ulrich, George, and Jacob, the sons of the beneficent Jacob, bought houses in one of the suburbs of Augsburg, pulled them down, and built 108 smaller houses, which they let to poor citizens at a low rent. This was the origin of the 'Fuggerei,' which still remains under the same name, with its own walls and gates. Many other benevolent institutions were set on foot by Antony F. and his sons. It is questionable if we are to rank among their benefactions their calling the Jesuits to Augsburg, and giving them buildings and revenues for a college, church, and school. The race is still continued in the two principal lines of Raimund and Antony, besides collateral branches. The domains are chiefly in Bavaria. A collection of portraits of the most important members of this great house, executed by Domin. Custos of Antwerp, appeared at Augsburg (1593 et seq.). This collection (increased to 127, with genealogies written in Latin) was republished by the brothers Kilian (Augsburg 1618); and in 1754, a new edition of the work, still further improved, and containing 139 portraits, was published at Ulm, under the title *Pinacotheca Fuggerorum*.

FUGITATION. A sentence of fugitation in Scotland corresponds to outlawry in a criminal process in England, and is pronounced where a person fails to appear to answer to a criminal prosecution against him. Amongst other consequences, it entails the escheat of his whole movable property to the crown. See ESCHEAT.

FUGITIVE SLAVE LAW. Slaves being regarded as property, things and not persons, as the Roman law puts it, the existence in every state in which slavery exists of a law recognising the right of the master to reclaim his property follows as a logical consequence. Accordingly, the constitution of the United States of America having recognised slavery, or 'service,' as it was gently termed by American writers, necessarily used to contain a number of enactments for its enforcement. By art. 4, s. 2 of that document, it was declared that persons held to service or labour in one state, under the laws thereof, and escaping into another, should be delivered up, on claim of the party to whom such service or labour might be due. In furtherance of this provision, the laws of New York provided for

the arrest of such fugitives, on *habeas corpus*, founded on due proof, and for a certificate in favour of the right of the claimant, and delivery of the fugitive to him, to be removed. This obsolete law, as narrated in the latest edition of Kent, seems to have been to the following purport: The act of 1793, providing for the reclamation of fugitives from justice and from service, had, so far as relates to the latter, been amended, and to a considerable extent superseded, by the act of September 18, 1850. The judicial duties imposed by the latter act were to be performed by the United States commissioners, who might have the power of arresting or imprisoning for offences against the United States, by the judges of the circuit and district courts of the United States, and of the superior courts of territories, and by such special commissioners as the respective courts might appoint. It was the duty of all United States marshals to obey and execute all warrants and process of such judges and commissioners; and after the arrest of any fugitives, such officers were liable for an escape with or without their assent. When any fugitive escaped into another state or territory, the owner, or his duly authorised agent, might pursue and personally arrest said fugitive, or might demand a warrant and arrest from the officer having due authority. The fugitive was then to be taken before a commissioner or judge, whose duty it was to hear and determine the complaint in a summary manner. Should he have been satisfied of the validity of the claim and the identity of the slave, it was his duty to deliver to the claimant a certificate of the proceeding had, with authority to remove the fugitive to the place from which he fled. The testimony of the fugitive was not admissible. Any assistance rendered to a fugitive to enable him to escape from the claimant, or any obstruction offered to his arrest, was penal, and also subjected the party to damages at the suit of the owner. All citizens of the United States were required, when called upon, to render the officers personal assistance in the performance of their duties. These provisions applied to all the states previously to the war, whether slavery was recognised by their special laws or not; the principle being, that 'the constitution and laws of the United States secure the right to reclaim fugitive slaves against state legislation.' In some of the slave-holding states it was held, that if a slave from such a state went lawfully into a non-slave-holding state, and acquired a domicile there with his master, or was emancipated there, he became emancipated, and ceased to
be a slave on his return; but if he were carried
for a temporary purpose, and returned, his sta
slavery was resumed. These provisions did not
to the fugitive slave (Kent, *ut sup.* ii. p. 297).

FU'GLEMAN, (properly, *Flugelman*, from
German *flügel*, a wing), an intelligent soldier p
in front of a line of men at drill, to give the
and an example of the motions in the manual
platoon exercises. He originally stood in fro
the right wing, and hence the name.

FUGUE, in Music, is the name of a compo

or FUH-HE-SHE, the first of the s of China that flourished in the period. He instructed the people in ring cattle, and invented the *pă-kwá*, inations of four strokes, to express the ature. His chief invention, however, tters, by drawing up the two linear Ho-too and Lo-shoo, which he copied from the back of a dragon rising from the deep. According to another account, knotted cords, 20 inches long, were used for writing, till Tsang-ke, the minister of F., conceived the idea of characters from seeing the footprints of birds on the sands. F. instituted marriage, invented the musical instrument called *kin*, and taught the art of fishing. It is clear that he personifies a condition of society. He had a head with projections like the horns of an ox, and the body of a dragon.—San-tsze-king, l. 21, 22; Kang-keen-e-che-luh, i. p. 6; Gutzlaff, *Sketch of Chinese History*, i. p. 119.

FUH-KEEN, or **FU-KIAN** (Happy Established, or The Consummation of Happiness), one of the eastern maritime provinces of China. It lies to the south of Che-keang, between the parallels of 23° 35′ and 28° 47′, and is backed by the great southern range of mountains that separates South-eastern China from the inland provinces. F. belongs to the hilly portion of China proper. It is a black-tea district, and produces barley, wheat, rice, tobacco, yams, and other Chinese vegetables. The principal fruits are the orange, li-chee, olive, plum, pomello (a fruit of the sub-acid order, somewhat like an orange), plantain, and mulberry. On its coast are situated the ports of Fu chow (q. v.) and Amoy, or Hia-mum (the gate or harbour of Hia), opened by the treaty of Nankin, 29th August 1842. See

CHINA. The island of Formosa and the Pang-hoo group are included in this province. Area, 53,480 square miles; pop. 38,888,432.

FÜHNEN (Dan., *Fyen*), the largest of the Danish islands after Seeland, is bounded on the W. by the Little Belt, which separates it from Jutland and Slesvig; on the N. by the Odensee Fjord; on the E. by the Great Belt; and on the S. by the Little Belt, and by the small island of Langeland, which is incorporated with it in one circle, or *stift*, of the kingdom. The area of this stift is 1302 square miles; the population (1870) was 236,311. The coast is generally rugged, and much indented with bays or fjords; but the interior is flat, except towards the south and west, where there is a range of hills rising to about 500 feet. The land, which is well watered by several small streams, is fruitful and well cultivated, producing abundant crops of cereals. Barley, oats, buckwheat, rye, flax, and hemp are grown in larger quantities than are required for home consumption. Honey is also largely exported. The F. horses are in great request, and large numbers of these animals, and of a fine breed of horned cattle, are annually sent out of the island. The province of F. is divided into the two bailiwicks of Odensee and Svendborg. The principal towns are Odensee (q. v.), Svendborg (q. v.), and Nyborg (pop. 4812), a fortified town on the east coast, and the most direct port of communication with Seeland, and memorable as having been the seat of the annual Danehof, or meeting of the States, instituted in 1354 by Valdemar IV., and for the victory gained in 1659 by the Danes and their allies over the Swedes.

FULAHS [properly, *Fúlbe* (sing. *Púllo*), called also Féllani (sing. Baféllanchi), Felláta, and Fullán], the name of a widely spread negro people in Upper Súdán, regarding whose origin there is much diversity of opinion. M. Eichwaldt (see *Journal de la Société Ethnologique*, 1841, vol. i. p. 2, et seq.) has endeavoured to connect them with the Malays in the far East, but, according to Dr Barth, 'none of his arguments are of any consequence.' Yet Dr Barth himself is of opinion that 'their origin is to be sought for in the direction of the East; but this,' he adds, 'refers to an age which for us is enveloped in impenetrable darkness.' The F. first emerge into the light of history about the beginning of the 14th c., when, as we learn from Ahmed Bábá's *History of Súdán*, two members of the tribe went on a religious mission from Melle, on the borders of Senegambia, to the king of Bórnu. The importance of this incident lies in the fact, that it shews that in the dawn of their history—as has invariably been the case in later times—the course of the tribe was from *west to east*, and also, that at the early period referred to, they were distinguished for that religious learning which still characterises them. After the 14th c., successive swarms of F. appear to have left the kingdom of Melle, or the mountainous region of Fuládu, and to have spread themselves over the greater portion of Súdán, 'absorbing and incorporating with themselves different and quite distinct national elements, which have given to their community a rather varying and undecided character.' Hence originate the conflicting accounts of travellers, some of whom speak of the F. as differing little from the negroes; others, as having their features and skulls cast in the European mould; while Bowen describes those of Yoruba as being some black, some almost white, and many of a mulatto colour, varying from dark to very bright. Many other tribes, which have not been quite absorbed by the F., are yet so far blended with them, that they have lost their native idiom altogether, and speak the language of the predominant race, which is termed the Fulfúlde. The F. are not all under one ruler; they are a race, not a *nation;* and have founded many kingdoms, such as those of Sókoto, Gando, Timbo, &c. The endless tribes belonging to their stock are generally divided into four groups or families, the Jel, the B'aá, the Só, and the Beri. Most of them became converted to Mohammedanism about the middle of the 18th c., and in 1802, under the Imám Othman, commenced a religious war on the surrounding pagans, which terminated prosperously in the establishment of the great Fulah empire of Sókoto. Othman died in a sort of fanatical ecstasy or madness in 1818. The F. are industrious and inclined to trade; they work iron and silver, manufacture with great neatness articles in wood and leather, and weave various durable fabrics. They are by far the most intelligent of the inhabitants of Súdán, and have, besides mosques, schools in almost all their towns.

FU'LCRUM, in Mechanics, is the prop or fixed point on which a lever moves. See LEVER.

FULDA, a town of Germany, in the Prussian province of Hesse-Nassau, 54 miles south of Cassel, is pleasantly situated on a rising-ground on the right bank of the Fulda, a considerable stream, which, rising from the western base of the Rhöngebirge, in Bavaria, flows northward through Hesse-Cassel, and unites with the Werra on the Hanoverian border, after a course of 110 miles. It is a pretty town, surrounded by old walls, and has a market-place, two squares, and eight suburbs. One of the chief buildings is the cathedral, the fourth church that has been built on this site. It is a handsome modern structure, and covers the shrine in which the body of St Bonifacius was deposited after his murder by the Frisians in 754. The other notable structures are the palace, formerly the residence of the prince-bishops of F.; the church of St Michael, founded in 822; a gymnasium, schools of art and manufactures, and a public library. F. has acquired a reputation for its linen manufactures; it has also extensive establishments for the manufacture of vinegar and beer; with dye-works, tanneries, and weaving. Pop. (1871) 9490, mostly Roman Catholics. The district of which F. is the capital forms part of what was formerly the grand-duchy of Fulda. This territory was incorporated with the grand-duchy of Frankfurt by Napoleon in 1810, and ceded to Prussia in 1815, but immediately afterwards was made over to Hesse-Cassel (q.v.).

FU'LGORA. See LANTERN-FLY.

FU'LGURITES (Lat., *fulgur*, lightning), tubes formed of vitrified sand, which are found in sand-banks, and in soils consisting chiefly of siliceous sand, and are attributed to the action of lightning melting and vitrifying the sand. They were first discovered in 1711 by the pastor Herman, at Massel, in Silesia, and have since been found in many places; but their origin was first pointed out by Dr Hentzen in 1805. They are from a quarter of an inch to two inches and a half in diameter, their internal surface of a perfectly glassy substance, hard enough to scratch glass, and to give fire with steel. They are usually, but not always, placed vertically in the sand, become narrower downwards, and sometimes divide and subdivide into branches.—The effects of lightning seem to be exhibited also in some places on rocks by vitrification and the production of a sort of enamel, sometimes assuming the form of beads.

FULHAM, formerly a village, but now a suburb of London, in the south of Middlesex, on the left the Thames, six miles south-west of St

rticles on literature and art, which have
ared in a collected form under the title of
Literature and Art (London, 1846). In
published *Woman in the Nineteenth Cen-*
h she very ably discusses the nature
of woman, and claims for the sex rights
o been long denied it. In 1846, she
to England, where she made the acquaint-
, for whom she had long entertained
m. At Paris she gained the friendship
e Dudevant, better known by her pseu-
Georges Sand. Proceeding next to Rome,
ame in contact with the Marquis Ossoli,
to whom she was afterwards married in December 1847. She took an active share in the political questions that agitated those times. In 1849, during the siege of Rome, she took the charge of an hospital; and viewed with feelings of pain the downfall of the new and ephemeral Roman Republic. In 1850, she set out on her return journey to America, accompanied by her husband and newly-born infant; but just as they came within sight of New York, on the 16th of July, a hurricane burst upon the devoted ship which carried them, and the three perished in the waves. Her memoirs were published by Emerson and Channing under the title of *Memoirs of Margaret Fuller, Marchesa Ossoli* (London, 1852).

FULLER, Thomas, D.D., an eminent English historian and divine, was born in 1608 at Aldwinkle, Northamptonshire, of which parish his father was rector. He was educated at Queen's College, Cambridge, and greatly distinguished himself by his application to study. He took the degree of A.B. in 1624, and that of A.M. in 1628. He stood so high in the estimation of his college that, before he was 23 years of age, he was appointed to St Benets, Cambridge, and acquired great popularity as a preacher. Soon after, he was collated to a prebend in Salisbury Cathedral, and obtained a fellowship in Sidney Sussex College. His first publication was a poem, entitled *David's Heinous Sin, Hearty Repentance, and Heavy Punishment* (1631, 8vo). He was next presented to the rectory of Broad Windsor, Dorsetshire; published his *History of the Holy War* at Cambridge in 1639; and in 1640 removed to London, where he was chosen lecturer at the Savoy Church in the Strand. The same year, he was a member of the Convocation at Westminster, and one of the select committee appointed to draw up new canons for the better government of the church. During the civil war he adhered firmly to the royal cause; and shared in its reverses. In 1646, however, he was chosen lecturer, first, at St Clement's Lane, Lombard Street, and afterwards at St Bride's. About 1648, he was presented to the living of Waltham, in Essex. In 1650, he published a geographical account of the Holy Land, entitled *A Pisgah Sight of Palestine and the Confines thereof* (folio, with maps and views), and *Abel Redivivus*, a collection of lives of modern divines. In 1655, he published at London *The Church History of Britain, from the Birth of Jesus Christ until the year* 1648 (folio). In 1658, he received the living of Cranford, Middlesex, and at the Restoration he was reinstated in his prebend of Salisbury, of which he had been deprived by the Parliamentarians. He was also appointed chaplain extraordinary to the king, and created D.D. at Cambridge by royal mandamus. He died August 16, 1661. His principal work, *The Worthies of England*, was published at London in 1662 (folio). Valuable for the information it contains on provincial history, it abounds in biographical anecdote, witty remark, and acute observation on men and manners. A new edition, with his life prefixed, appeared in 1810 (2 vols. 4to). His *Holy and Profane States* were republished in America in 1831. Quaint humour is one of F.'s peculiar characteristics; but his writings are no less remarkable for wisdom, imagination, and, when occasion demands, even for pathos. 'Next to Shakspeare,' says Coleridge, 'I am not certain whether Thomas Fuller, beyond all other writers, does not excite in me the sense and emulation of the marvellous. . . . He was incomparably the most sensible, the least prejudiced great man, in an age that boasted of a galaxy of great men.'

FULLER'S EARTH, a mineral consisting chiefly of silica, alumina, and water, with a little magnesia, lime, and peroxide of iron. The silica is about 50, the alumina 20, and the water 24 per cent. of the whole. It is regarded as essentially a hydrous bisilicate of alumina. It occurs in beds, associated with chalk, oolite, &c.; is usually of a greenish brown or a slate-blue colour, sometimes white, has an uneven earthy fracture, and a dull appearance; its specific gravity is from 1·8 to 2·2; it is soft enough to yield readily to the nail; is very greasy to the touch; scarcely adheres to the tongue, falls to pieces in water, but does not become plastic. It has a remarkable power of absorbing oil or grease; and was formerly very much used for fulling cloth (see WOOLLEN MANUFACTURE), for which purpose it was considered so valuable, that the exportation of it from England was prohibited under severe penalties; it is still used to a considerable extent. The annual consumption in England is said to have at one time exceeded 6000 tons. It is found at Nutfield, near Reigate, in Surrey, in cretaceous strata; where there are two distinct beds, the upper one of a greenish colour, and 5 feet thick, resting on the other, which has a bluish tint, and is 11 feet thick. It is also found in Bedfordshire, Nottinghamshire, and Kent; and on the continent in Saxony, Bohemia, and near Aix-la-Chapelle. There is a considerable deposit of it at Bath, where the group of associated blue and yellow clays and marl has received the name of 'the Fuller's Earth Series.' It is also found at Maxton, in Scotland.

FULMAR or **FULMAR PETREL** (*Procellaria* or [illegible]), a genus of birds generally referred to the gull family ([illegible]), and containing some of the most strictly oceanic birds. See PETREL. The [illegible] not longer than the head, large, strong, and [illegible], the upper mandible suddenly hooked at the point, the lower mandible with the tip [illegible] downwards, the tips of both mandibles appearing as separate pieces firmly joined to the straight part of the bill, which is marked by [illegible]; the nostrils enclosed in a [illegible] the extremity, and extending along the [illegible] of the upper mandible. The tarsi are compressed, [illegible] a mere claw.

[illegible]

seas, in which its numbers are prodigious; breeds on the rocky shores of the Faröe Islands, Iceland, Greenland, Spitzbergen, &c., on the grassy shelves of the precipices, making a slight nest or a mere excavation, in which it lays one egg. It is rarely to be seen on the southern coasts of Britain, but more frequently in Orkney and Shetland, where, however, it is said never to breed, although it breeds in great numbers in St Kilda and the adjacent islets of Borrera and Soa. It frequents these [illegible] in vast numbers, and is of great importance to the inhabitants of St Kilda, who esteem its eggs above those of any other bird, and seek them in the most perilous manner, descending by ropes from the summit of the precipices. The fulmars are also valued for their feathers, for their down, and for their oil, which is one of the principal products of St Kilda, and is obtained from their stomachs. The old are said to feed the young with it, and when they are caught or assailed, generally lighten themselves by disgorging it. It is amber-coloured, and has a peculiar and very disagreeable odour. Fulmars feed on all animal substances which come in their way, giving an evident preference to fat, and delighting in the blubber of whales. They pursue whales to prey on the cirrhopods which are attached to them, or imbedded in their skin. [illegible] them soon gather around a dead whale, and they are so bold as to advance within a few yards of the men who are cutting it up. When food is abundant, they often glut themselves till they are unable to fly. They follow the greasy track of a whaler, and, indeed, some of them are always in attendance on ships immediately after they pass north of the Shetland Islands, ready to seize any garbage that may be thrown overboard. Sailors often amuse themselves in catching them by means of lines and hooks baited with fat.

Another species of F. [illegible] the Pacific Ocean, and the M[illegible] of sailors, a large bird of the southern seas, is sometimes referred to the same genus.

FULMINATE OF MERCURY, or **FULMINATING MERCURY** [illegible], is prepared by dissolving 3 parts of mercury in [illegible] of nitric acid of specific gravity [illegible], without the application of heat, in a flask capable of holding 18 times the bulk of the acid. The solution is then to be poured into a large vessel containing 17 parts of alcohol of specific gravity [illegible]

FULMINATE OF SILVER, or [illegible] is prepared [illegible] the same manner as the fulminate of [illegible]

received a patent from the legislature)
pretty general use upon the rivers of the
les. Although F. was not the first to
to navigation, as a steam vessel had

been tried upon the Forth and Clyde Canal as early as 1789, yet he was the first to apply it with any degree of success (see STEAM-NAVIGATION). His reputation was now firmly established, and he was employed by the United States government in the execution of various projects with reference to canals and other works. In 1814, he obtained the assent of the legislature to construct a steam-frigate, which was launched in the following year. Though the labours of F. were attended with such great success, various lawsuits in which he was engaged in reference to the use of some of his patents, prevented him from ever becoming wealthy; and anxiety, as well as excessive application, tended to shorten his days. His death in 1815 produced extraordinary demonstrations of mourning throughout the United States. F. had married, in 1806, a niece of Robert Livingston, U. S. minister in France.

FUM, or, more properly, **FUNG** the first being the Portuguese pronunciation of the word; the Chinese Phœnix one of the four symbolical animals supposed to preside over the destinies of the Chinese empire. Its appearance indicates an age of universal virtue, the influence of which has extended throughout creation. It is supposed to originate from the element of fire, and to be born in the Tan-heuě, or Hill of the Fiery Halo of the Sun; to have the forepart of a goose, hind-quarters of a stag, neck of a snake, fish's tail, fowl's forehead, down of a duck, dragon's marks, the back of a tortoise, face of a swallow, and beak of a cock, with beak, claws, and feathers of various colours, red crest, and golden beak. It is about six cubits high, and comes from the East. In mystical language, it is called the Leih-kwan, or 'mandarin of time,' and it is said to have a forehead like heaven, eyes like the sun, back like the moon, wings like the wind, feet like earth, and a tail like the planets. On its body are inscribed the five cardinal virtues. According to some authors, it only perches on the woo-tung tree, and eats the seeds of the bamboo; others describe it as swallowing small carp. Other accounts say it eats no living insect, and treads on no growing plant. Its voice is said to be like a flute, drum, or even thunder. When seen, it is followed by birds. According to Chinese history, it has occasionally appeared; and a celebrated female flute-player, named Lung-yu, is said to have enticed it from heaven with her music, and then fled away with it. Like the phœnix of the Egyptians and roc of the Arabs, the bird may have had a historical origin, subsequently disfigured by fiction. It is often represented on Chinese works of art, under the form of a gallinaceous bird, and is embroidered on the dresses of mandarins of a certain rank. It is mentioned by some modern English poets.—Kidd, *History of China*, p. 267; Ching tsze-tung, 172 sect.; Yuen-keen luy han, 148 sect.

FUMAGE, in the Law of England, was properly smoke-farthings, or a customary payment for every house that had a chimney or fire-hearth. This tax is mentioned in Domesday as paid by custom to the king for every chimney in the house. Edward the Black Prince is said to have imposed a tax of a florin for every hearth in his French dominions. The first statutory enactment on the subject in England is by 13 and 14 Car. II. c. 10, whereby a tax of 2s. on every hearth in all houses paying to church and poor was granted to the king for ever. This tax was abolished 1 William and Mary, st. 1. c. 10.

FUMARIACEÆ, a natural order of exogenous plants; herbaceous, with a watery juice; their leaves alternate, much divided; the calyx of two deciduous sepals; the corolla of four very irregular petals; the stamens sometimes four and distinct, more generally six and in two bundles; the ovary free, one-celled, one-seeded, or many-seeded; the seeds having large albumen. The F. are regarded as in their botanical characters approaching most nearly to the *Papaveraceæ* (Poppy, &c.); but their general aspect is very different, and they do not possess the same powerful properties. Both the foliage and flowers of some have considerable beauty. *Dielytra spectabilis* is a well-known favourite in gardens and green-houses. More than one hundred species are known, mostly natives of temperate climates in the northern hemisphere. Several species of *Fumaria* and *Corydalis* are natives of Britain. The COMMON FUMITORY (*Fumaria officinalis*) is a very frequent weed in gardens and cornfields, but of rather delicate and beautiful appearance. It is annual, and easy of extirpation, where it springs up in excessive abundance. It was formerly much employed in medicine, having a high reputation as a tonic and diaphoretic, and although disused in Britain, is still esteemed in France as a remedy in scorbutic affections, chronic eruptions, &c. Some of the other species of fumitory possess similar properties. The leaves have an intensely bitter saline taste.

Common Fumitory (*Fumaria officinalis*).

FUMA'RIC ACID, known also as Boletic Acid ($2HO,C_8H_2O_6$), is of frequent occurrence in the vegetable kingdom. It was first obtained by Braconnot from a species of boletus, and has since been found in many other fungi, in numerous lichens, in various species of Fumaria, in Corydalis bulbosa, &c.

Fumaric acid may also be obtained, in association with malæic acid, by heating Malic Acid (q. v.) to 350° F.

It crystallises in prisms, which have a very acid taste, are only slightly soluble in water, but dissolve readily in alcohol and ether. At a temperature of 392° F., it volatilises without fusing, and is converted into the malæic acid already mentioned, which possesses the same composition as fumaric acid, but different properties. If malæic acid is exposed for a long time to a temperature of 266°, it again passes into fumaric acid, so that these acids are mutually convertible.

Kekulé has recently shewn (*Annalen d. Chemie*, 1861) that both fumaric acid and malæic acid combine directly with bromine, and produce crystals of dibromo-succinic acid; and further, that acid be dissolved in water, and digeste amalgam of sodium, the nascent hydrogen decomposed water combines with the converts it into succinic acid. Its comp of no special interest.

FU'MIGATING PA'STILS are co various ingredients, which, by their s combustion, evolve agreeable odours. The recipe for their composition is given in the berg Pharmacopœia: Take of benzoin balsam of Peru, each 16 parts; of yello wood, 4 parts; of labdanum, 1 part; from lime-tree wood, 96 parts; of nitrate 2 parts; and of mucilage of tragacanth, form the mixture into a paste, from whi pastils are to be made by a small mould.

The 'Ribbon of Bruges' is also em aromatic fumigation in the same manner It is prepared as follows: Dissolve two nitrate of potash in a pint of water; in steep good undressed cotton-tape, and ha dry. Prepare a tincture composed of s pint; musk, half an ounce; otto of roses, o benzoin, four ounces; myrrh, half an root, half a pound. When this tinc for a month, steep the prepared tape when dried is fit for use. L it the flame; and as it smoulders, a will rise into the air. For f on this and allied subjects, see *Perfumery*.

FUMIGA'TION (Lat. *fumigatio*, fr smoke), the cleansing or medicating of the apartment by means of vapours, employ for the purpose of detaching infectio from clothing, furniture, &c. See C INFECTION. Most of the methods of formerly employed have little real valu to be looked on chiefly as grateful to t as, for instance, the burning of frankinc phor, &c. The really active processes a under the article DISINFECTANTS.

FUNCHA'L, the capital and the the island of Madeira (q. v.), is situated side of the island, and consists chiefly extending for about a mile along the sh numerous streets and lanes at right an main street, and leading up the hill the town. Its roadstead is open, and its rocky and uneven. F. has a cathedral, churches, and small convents, and is de four forts. From it all the produce of th exported. Pop. 30,000.

FUNCTIONS, a mathematical two or more variables are combined in an equation, and are such that a c of one implies a corresponding cha one or more of the others, then suc said to depend on, and to be other; and the expression of the ence is said to be a *function* If such an expression involves but is said to be a function of one variabl are involved, to be a function of two and so on. Thus sin x, e^{ax}, log. x, $\sqrt{a}$ functions of one variable—viz. of x; e^{ax} $(ax + by)$, x^y, are functions of two variable so xyz, $x^2 + y^2 + z^2$ are functions of three and so on. Functions are denoted by th F, f, ϕ, ψ, &c. Thus F(x) means a funct variable, x, combined with constants or case may be; $\psi(xyz)$ a function of three These functional symbols are *general*,

UNCTIONS in the *Encyclopædia Metro-*

D, FUNDING SYSTEM. Fund (Lat. *fundus*, ground, foundation) means a supply of money or a source whence money may be obtained. When we speak of 'the funds' in this country, we mean that great organisation for buying and selling the right to become a public creditor, and receive a share of the interest of the national debt. See DEBT, NATIONAL. When money has in this country been borrowed for public purposes, and it has been found that it cannot be repaid as a temporary loan, the resolution to hold it as a perpetual loan at a certain interest has been called 'funding' it; and hence we read from time to time that certain obligations were converted from floating into funded debts.

FUND, SINKING, a plan pursued for a considerable period for the purpose of collecting money for the payment of the national debt of Great Britain. It was begun in 1716 by Sir Robert Walpole. Certain taxes which had previously been laid on for limited periods were then rendered perpetual, for the purpose of paying the interest of the funded debt. They produced more than enough for this purpose, and the surplus was laid aside, that it might accumulate into a fund for extinguishing the debt. It appeared to operate well, since, in 1728, after it had existed for twelve years, debt was wiped off to the extent of £6,648,000. It was not observed that, during the wiping off, new debt had been created to about the same extent, so that the nation was just in the position in which it would have been had it neither borrowed nor repaid. It is supposed that Sir Robert may have seen the fallacy of the sinking fund, since in 1732 he took half a million from it to meet the expenditure of the year, instead of raising a new loan. It was in 1786, however, that the system was established on a great scale by the younger Pitt, who, notwithstanding his great practical abilities, was entirely misled by the theories of Dr Price in his work on Annuities. The system continued to be conducted on an enormous scale, until another student of economy and figures conclusively proved it to be useless; this was accomplished in 1813 by Dr Hamilton, in his *Inquiry concerning the Rise and Progress, the Redemption and Present State, and the Management of the National Debt of Great Britain.* The fallacy which Dr Hamilton shewed to pervade a sinking fund may be best explained by a simple example. Suppose that one requires to borrow £100, and lays by £5 a year as a fund to pay it up with. Accumulating at compound interest, this fund will pay back the loan in about fifteen years. The borrower will, however, gain no more by the process than if he paid the £5 a year to his creditor, for his debt would be diminishing to precisely the same extent as the fund to pay it off would be increasing. Suppose that while requiring only £100, the borrower raises £200, and lends out one of them, accumulating the interest until the whole amounts to £200; the borrower will no doubt be receiving interest on £100, but he will be at the same time paying interest on £200; and he would repay his debt at the same cost and with more simplicity if, instead of borrowing the second hundred at 5 per cent., he paid over £5 a year to his creditor. In these instances, nothing is lost by the sinking fund. But suppose that in the last case the creditor had agreed to lend the £100 at 5 per cent., but in consideration of the greater risk, would not lend the £200 at less than 6 per cent., while the borrower can only get 5 per cent. for the half which he relends here the transaction would cause a dead loss of £2 a year over the plan of repaying by instalments. This was exactly the case with the British sinking fund. The more money the chancellor of the exchequer wanted, the higher were the

absorb oxygen, and give out carbonic
some naturalists have proposed to

constitute for them a distinct kingdom of nature intermediate between the animal and the vegetable.

Fungi are very various in size, many being scarcely visible without a microscope, whilst others are some feet in diameter. Even the same species, however, often exhibits great variety, not only in size, but in other particulars, according to the different circumstances of its growth, causing great difficulty to the botanist, whilst further difficulty arises from the modifications of imperfectly developed mycelium, of which many spurious genera have been constituted. A great resemblance in general appearance to fungi is sometimes exhibited by diseased portions of leaves, &c., and by the secretions caused by the attacks of insects.—When the spore (seed) of a fungus germinates, it sends out radiating filaments, which generally branch and interlace, and portions of this mycelium removed to another favourable situation, grow there, so that fungi are propagated by this means as higher plants are propagated by their tubers or by the division of their roots. The fungi of simplest structure or lowest organisation consist of nothing more, when they have reached their fullest development, than masses of spheroidal cells, spores, breaking up into a fine powder, as in some of the small parasitic species which are very injurious to corn. Sometimes these cells are united into jointed threads. In species of rather higher organisation, the plant consists of jointed threads, but the spores are formed in the enlarged terminal joints, and are dispersed by their bursting. In the higher kinds, the spores are produced in or on peculiar organs of extremely various shape and character. In some, as puff-balls, the whole interior of the plant is filled with the fructification. In agarics, boleti, morels, &c., the fructification takes place on a particular membrane, a part of the external surface of the plant, called the *hymenium*, variously situated (in agarics on the under side of the *pileus* or cap), the extent of which is often greatly increased by wrinkles, plates or *gills*, pits, pores, &c. These form the highest division of fungi, called *Hymenomycetes*, in the system of Fries, the greatest continental authority in mycology, as this department of botany is sometimes termed. Berkeley, who, without any near rival, occupies the first place among the mycologists of Britain, divides fungi into two 'classes;' the first class not having the spores enclosed in tubular sacs (*asci*) or vesicles, and containing the 'orders' *Hymenomycetes* (agarics, boleti, &c.), *Gasteromycetes* (puff-balls, &c.), *Coniomycetes* (rust, smut, &c.), *Hyphomycetes* (mould, mildew, *botrytis*, *oidium*, &c.); the second class containing two orders, *Ascomycetes* (morels, truffles, &c.), in which the spores are definitely arranged in *asci*, and *Physomycetes* (some kinds of mould, plants which grow on fermenting substances, and some of the minute pests of cultivated plants) in which the spores are in vesicles without definite arrangement.

Fungi generally grow in damp situations, but there are many which occur chiefly on dry soils or on dry substances; and some appear in their greatest perfection in the finest summer weather, although many are most abundant in the colder and moister seasons of the year. It has been commonly asserted that they abound more in the colder parts of the world than within the tropics, but it is not improbable that this opinion has its origin merely in imperfect observation of tropical species. The extreme rapidity of their growth, the briefness of their whole existence, the readiness with which they pass into decomposition, and the difficulty of preserving most of them in a form fit for examination, have been great obstacles to their scientific study. It is known, however, that some species are of very wide geographic distribution, whilst others are comparatively very limited. Some species grow in earth, others in various kinds of putrescent or fermenting animal or vegetable matter, many in decaying parts of trees or on dead wood, others on diseased animal and vegetable tissues, &c. It appears to be the office of many of them to hasten the decomposition of animal, and more particularly of vegetable substances. Some of the minute kinds appear to be the cause of disease in the higher kinds of plants which they attack, and are formidable to the farmer and the gardener. Some are in like manner destructive to animal life, as in the case of the Muscardine (q. v.) or Silk-worm Rot, and certain species of *Sphæria* which grow from living caterpillars. See ENTOPHYTES.

Some fungi are remarkably phosphorescent. Thus the undeveloped mycelium of some kind produces a very beautiful luminosity in some German coal-mines; and a species of agaric (*Agaricus Gardneri*), growing on palms in Brazil, shines brightly in the night. *Agaricus olearius*, a native of the south of Europe, is also luminous.

The chemical examination of fungi yields in large quantity a substance called *Fungine*, which, however, is now regarded as consisting of cellulose and fatty matter, several other nitrogenous substances, an acid called *Fungic Acid*, a kind of sugar, &c. The poisonous properties of some are ascribed to an alkaloid called *Amanitine*. Others appear to owe their poisonous character to an acrid volatile substance. Many of the smaller fungi are important because of the injury which they cause to crops, timber, &c. A few species are used in medicine, of which the only one really important is Ergot of Rye. One or two are used as tinder (see AMADOU), Moxa (q. v.), &c. The smoke produced by burning the dust (spores) of ripened puff-balls has anæsthetic properties, and is used for stupifying bees. *Polyporus squamosus* cut into slices makes the best of razor-strops. But the chief economical use of fungi is for food, and in the manufacture of the sauce called Ketchup (q. v.).

Edible Fungi.—Many fungi of the sub-orders *Hymenomycetes*, *Gasteromycetes*, and *Ascomycetes* are edible; and some of them are much esteemed as delicacies, whilst in many countries they constitute an important part of the food of the people. In Britain, very few are used, many of those species which are most esteemed on the continent of Europe being utterly disregarded, and indeed classed in popular estimation with toad-stools as poisonous. The truth appears to be, not that the greater number are poisonous, and only a few edible, but that the noxious species are comparatively few, the principal danger arising from the similarity of some of the poisonous and some of the edible agarics, and from the liability of some of the edible species to acquire poisonous properties in particular situations and circumstances. This is notably the case with the common mushroom (*Agaricus campestris*), which is far more generally used in Britain than any other edible fungus, but of which some varieties are unsafe, apparently in consequence of the circumstances of their growth. From the markets of Rome, and other cities of Italy, where numerous species of fungi are extensively sold, this species is rigorously excluded. So important an article of food are fungi in Italy, that in the market of Rome alone they are supposed to be sold to the value of about £4000 a year. For weeks, both in spring and in autumn, fungi form the principal and almost the sole food of multitudes of the poor in Italy, Germany, and France; and besides those which are eaten fresh, great quantities are used dried or preserved in oil, vinegar, or brine. The soaking of fungi in vinegar or brine takes away the acrid qualities of some which are dangerous when fresh, and renders

them perfectly safe. So valuable are fungi e
that some species are frequently cultivate
cultivation of the Common Mushroom (

object borrowed, but its equivalent.
nature, from the fact that they were
for another (*funguntur*), were called
other class of movable objects, again,
Roman contract of *commodatum*, or
so called, applied, were transferred to
on condition that he should return
l objects to the lender.

(Lat. a mushroom) is a term applied
and surgery with several significations.
xcrescence from a surface of skin, or
ane, or even from deeper parts, is
d a fungus, more especially if it have
m-like character, and a broad short
n the pedicle is long and narrow, it is called Polypus (q. v.). The growths to which the term fungus is chiefly applied are those which have the characters of Cancer (q. v.); especially *fungus hæmatodes*, a very dangerous variety. But fungus has yet another application in pathology, to those minute incrustations and alterations of the skin which are dependent upon the growth of vegetable parasites, as Favus, Ringworm (q. v.), &c.

FUNNEL (Lat. *fundo*, to pour), in steam-vessels, is the iron tube designed to convey away above the deck the smoke and gases set at liberty during the combustion of fuel in the boiler-flues, and also, from its height, to afford a sufficient draught to the furnaces. In large ships, the funnel is of great size; and in men-of-war, usually telescopic, so that, by simple mechanism, it may be withdrawn during an action from the chance of injury by cannon-shot.

FUNNEL, a conical vessel terminating in a tube, and used for pouring liquids into narrow-mouthed vessels, and in laboratories for filtering. See FILTER. For common purposes, they are made of tin-plate or copper, but when for corrosive liquids, they are made of glass or earthenware. In some parts of Great Britain, as in the midland counties of England, a funnel is called a 'tun-dish;' in other parts, a 'filler.'

FUR is the term applied to the incrustation which is formed in the interior of vessels (tea-kettles, boilers of steam-engines, &c.) when calcareous water has been for a considerable time boiled in them. Many spring waters contain carbonate of lime held in solution by carbonic acid. When this water is boiled, the acid is expelled, and the carbonate is deposited, often in association with a little sulphate, forming a lining more or less coherent upon the sides of the vessel. In steam-boilers, this may be prevented by the addition of a small quantity of sal-ammoniac (hydrochlorate of ammonia) to the water; double decomposition takes place, carbonate of ammonia being formed and volatilised, while chloride of calcium remains in solution.

FUR AND FURRIERY. The skins of animals, having hair or fur as a coating, have been used in Europe as an article of clothing for many centuries. Since European countries, however, have become more and more cleared and inhabited, fur-bearing animals have nearly disappeared; and the supply is now chiefly obtained from other regions, especially North America.

All the chief fur-bearing animals will be found described under their proper headings: we shall do little more here than barely enumerate them. *Ermine* fur is of a pure white, except the tip of the tail, which is black. The spotted appearance of this fur is not natural; it is produced by sewing the black tail-tips on the white fur at certain spots. *Stoat* fur is a kind of inferior ermine. *Sable* fur, obtained chiefly from Northern Russia and Siberia, is valued in proportion to the darkness of its colour. *Marten* fur, especially that of a rich dark-brown olive colour, is much sought for. *Fiery-fox* fur, brought chiefly from the north-eastern part of Asia, is admired both for its brilliant fiery colour and for its fineness. *Red-fox* fur, differing in some particulars from the kind just named, is much sought after by the Chinese for trimmings, linings, and robes. *Silver-fox* fur has a peculiar lustrous silver-gray colour. *Nutria* fur, belonging to the animal called the *coypou*, is brought largely from South America, chiefly as a cheap substitute for beaver. *Sea-otter* fur has been known in Europe about a century and a half, being obtained from the otters which frequent the seas washing the Asiatic shores of the Russian dominions; it varies from a beautiful brown to jet-black, and is very fine, soft, and glossy. *Seal* fur is obtained from the seals frequenting various coasts, chiefly in the Southern Ocean. *Beaver* fur was once much in request for the manufacture of hats; but the growing scarcity of the animal, and the substitution of silk hats for beaver hats, has lessened its importance. The fur of various other animals is similarly valued, either for its warmth or its beauty; such as that of the *bear*, *racoon*, *badger*, *minx*, *lynx*, *musquash* or *musk-rat*, *rabbit*, *hare*, *squirrel*, and *chinchilla*.

For manufacturing purposes, furs are classified into *felted* and *dressed*. Felted furs, such as beaver, nutria, hare, and rabbit, are used for hats and other felted fabrics, in which the hairs or filaments are made so to interlace or entangle as to form a very strong and close plexus. The quality of the fur is better when the skin is taken from the animal in winter than in any other season, giving rise to the distinction between 'seasoned' and 'unseasoned' skins. The removal of the fur from the pelt is a necessary preliminary to the preparation of fur for felting purposes. In many kinds of skin, such as that of the hare, the fur is of two kinds—a close short layer of felting fur next the pelt, and longer outer hairs of unfelting fur. The removal of these two is effected separately. The long hairs are cut off by a kind of shears; and the true fur is then removed by the action of a knife, bearing some resemblance to a cheese-cutter, requiring much care in its management. In some sorts of skin, the long hairs are removed by pulling instead of shearing; in others, the greasiness of the pelt renders necessary a cleansing process before the shearing can be conducted, with the aid of soap and boiling water; and in others, both pelt and fur are so full of grease as to require many repetitions of cleansing. For beaver skins, a machine of very beautiful construction is employed in cutting the fur from the pelt. When the coarse hairs have been removed to form a stuffing for cushions, the skin is placed in a machine containing a broad keen blade equal in length to the width of the skin. This blade has a peculiar reciprocating movement given to it, producing a kind of chopping effect on any substance to which it is applied, by coming nearly in contact with another blade placed parallel with it. The skin is guided between rollers into the space between the two blades; and then the action of the upper blade crops off the fur from the pelt in a very complete manner every particle being removed, and yet the pelt is not cut. The fur falls upon an endless apron, which carries it to a chest, or trunk, containing a blowing-machine; this machine separates the fur into three or four qualities, by blowing to the furthest distance the lightest and most valuable filaments, leaving the heavier and coarser to be deposited sooner.

Furs have their felting property sometimes increased by the process of *carroting*, in which the action of heat is combined with that of sulphuric acid. The chief employment of felted furs is described under HAT MANUFACTURE.

Dressed furs are those to which the art of the *furrier* is applied for making muffs, boas, and fur-trimmings to garments. The fur is not separated from the pelt for these purposes; the two are used together; and the pelt is converted into a kind of leather to fit it for being so employed. The fur-hunters always exercise great care in drying the skins after removing them from the animals, seeing that any putrefactive action would ruin the fur. When brought to England, the skins undergo certain cleansing processes. They are steeped and scoured in a bath of bran, alum, and salt, to remove greasiness from the pelt; and then in a bath of soap and soda, to remove oiliness from the fur. When thoroughly washed and dried, it is found that the pelt, by the action of the alum, has been converted into a kind of *tawed* or kid leather.

When the skins are cleansed and dried, they are made up into garments and trimmings by sewing through the pelt. The skins, however, are very irregular in shape, and often differ much in colour in different parts; they require to be cut up into pieces, matched according to tint, and sewn together edge to edge. This requires much skill, especially where the furs are of a valuable sort. A fur garment or trimming, appearing to the eye as if it were one uniform piece, is thus generally made up of many curiously shaped pieces. The shaping for use, and the lining with silk and other materials, call for no description.—The great source of furs is the Hudson's Bay Territory (q. v.).

FURFU'RAMIDE, FU'RFURINE, AND FUR-FUROL. When starch, sugar, or bran is acted upon by dilute sulphuric acid and peroxide of manganese, the distillate contains not only Formic Acid (q. v.), but a small quantity of an essential oil, which, after being purified by redistillation, is colourless, has a fragrant odour somewhat resembling that of bitter almonds, and when dissolved in cold sulphuric acid, forms a beautiful purple liquid. This oil is termed Furfurol, and its composition is represented by the formula $C_{10}H_4O_4$.

If furfurol be treated with ammonia, it is converted into Furfuramide ($C_{30}H_{12}N_2O_6$), which occurs in colourless crystals, insoluble in water, but soluble in alcohol, and perfectly neutral.

If furfuramide is boiled with a solution of potash, it dissolves, its elements assume a new arrangement, and the solution on cooling deposits long silky needles of a powerfully alkaline base, Furfurine, which is isomeric with furfuramide. It is dissolved by dilute acids, and completely neutralises them; and on adding ammonia to these solutions, the alkaloid is precipitated unchanged. It was discovered by the late Professor Fownes; and as the first vegeto-alkali artificially formed, its production was regarded as a great step in organic chemistry.

FURIDPU'R, a town of Bengal Proper, capital of a district of the same name, stands on the right bank of the Ganges, here called the Podda, in lat. 23° 36′ N., and long. 89° 50′ E. It is 115 miles to the north-east of Calcutta. Excepting the public establishments, which it possesses as the capital of the district of its own name, the place is mainly a scattered series of native villages; and, in fact, it claims notice chiefly as having at one time been a nest of river-pirates.

FURIDPU'R, or DACCA JELALPU'R, the district mentioned in the preceding article, stretches in N. lat. between 23° 3′ and 24° 5′, and in E. long. between 89° 30′ and 90° 15′, containing 1538 square miles, and 1,012,589 inhabitants. It is everywhere intersected by branches or feeders of the Ganges, which, as the surface barely rises above the level of the sea, are all, unless in the dry season, well adapted to navigation. The soil is in general rich; and the climate, more particularly from the beginning of March to the middle of June, is excessively hot.

FURIES. See EUMENIDES.

FURLONG (the length of a furrow), a measure of length, the eighth part of a mile or 220 yards. See YARD.

FURLOUGH, a military term signifying l of absence. Non-commissioned officers and pri soldiers on furlough must be provided with a or they are liable to be seized and de deserters.

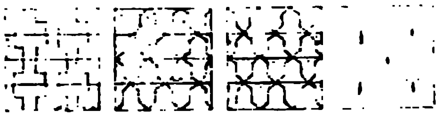
ABAD (Happy Residence), a city q. v.), stands near the right bank in lat. 27° 24′ N., and long. 79° 40′ E. e, cleanly, and healthy place, 570 level of the sea, with a considerable population of (1871) 73,110. Inde- position on the grand artery of is within 20 miles of the great utta and Delhi. Here Lord Lake of Holkar in 1805.

ABAD, the district of which the name is the capital, in the N.-W. hes in N. lat. between 26° 46′ and E. long. between 78° 57′ and 80° 2′. With a population of (1871) 918,784, it contains only 1702 sq. m., scarcely one-twelfth of the area being beyond the limits of the Doab. The commercial crops are principally cotton, tobacco, and indigo.

FURS, in Heraldry. Shields being often covered with the skins of wild animals, on which the fur was left, there came to be certain kinds of fur which were used in coat-armour, as well as in trimming and lining the robes of knights and nobles, and the mantles which were represented as surrounding their shields. The principal heraldic furs are—1. Ermine of which the field is white, and the spots black; 2. Ermines of which the field is black, and the spots white; 3. Erminois which has the field gold, with black spots; 4. Vair, which consisted of pieces of the shape of little glass pots (Fr. *verres*, of which the word is a corrupt spelling). It is said that the furriers used such glasses to whiten furs in, and because they were commonly of an azure (blue) colour, the fur in question came to be blazoned *argent* and *azure*; whilst counter-vair, in which the cups are represented as placed base against base, in place of edge to base, as in vair, was *or* and *azure*.

FURS.



Potent. Counter-vair. Vair. Ermine.

5. Potent and counter-potent, which are supposed to resemble the heads of crutches, placed differently, but having the same tinctures—viz., azure and argent.

FÜRST, JULIUS, a distinguished orientalist of Jewish parentage, was born 12th May 1805, at Zerkowa, in the grand-duchy of Posen, Prussia, where his father was Lecturer on Circumcision in the synagogue. F. was educated for the rabbinical profession, and displayed at a very early age a most remarkable power of acquiring knowledge. He studied at Berlin, where the German philosophy made sad havoc of his previous convictions. The conflict in his mind between science and rabbinical lore ended, in 1829, in the defeat of the latter, and F. immediately proceeded to Breslau, where he continued his oriental, theological, and antiquarian studies, which were completed at Halle in 1831, under Gesenius, Wegscheider, and Tholuck. In 1833 he went to Leipsic, where he became professor in the university in 1864. Among his numerous and valuable writings may be mentioned *Lehrgebaude der Aramaischen Idiome* (System of Aramaic Idioms, Leip. 1835), a work which brought the Semitic languages within the sphere of comparative grammar, then in its infancy, and which, besides, sought to establish a system of analytico-historic investigation in regard to these languages themselves; *Perlenschnure Aramaischer Gnomen und Lieder* (Pearl-strings of Aramaic Gnomes and Songs, Leip. 1836), with elucidations and glossary; *Concordantiæ Librorum Sacrorum Veteris Testamenti Hebraicæ et Chaldaicæ* (Concordances of the Sacred Books of the Old Testament in Hebrew and Chaldee, Leip. 1837—1840), a work of indefatigable industry and careful research, which has obtained for its author a great reputation both in Germany and other countries; *Ari Nohem* (Leip. 1840), a polemical treatise on the genuineness of the Sohar and the worth of the Cabbala; *Die Sprüche der Vater* (The Sayings of the Fathers, Leip. 1839); *Die Israelitische Bibel* (The Hebrew Bible, Berlin, 1838), translated into

German from the original, by himself, in conjunction with other scholars; *Der Orient; Berichte, Studien und Kritiken für Jüdische Geschichte und Literatur* (The East; Notices, Studies, and Criticisms in connection with Jewish History and Literature, Leip. 1840); *Die Jüdischen Religionsphilosophen des Mittelalters* (The Jewish Religious Philosophers of the Middle Ages, Leip. 1845); *Geschichte der Juden in Asien* (History of the Jews in Asia, Leip. 1849); *Bibliotheca Judaica* (1849—1853); *Hebräisches und Chaldäisches Handwörterbuch* (Hebrew and Chaldee Manual, Leip. 1851—1854); and an edition of Winer's *Chaldee Reading-Book* (1864). He died in 1873.

FÜ'RSTENWALDE, a small walled town of Prussia, in the province of Brandenburg, on the right bank of the Spree, 30 miles east-south-east of Berlin. It has a brick church of the 14th c., the *Marienkirch*, which contains a fine Gothic *Sacramentshäuschen* (or pyx for keeping the host), built of sandstone, and dating from 1510. F. manufactures linens and woollens, and carries on some trade by river. Pop. (1871) 8197.

FÜRTH, a flourishing manufacturing town of Bavaria, in Middle Franconia, is situated at the confluence of the Rednitz and the Pegnitz, about 5 miles north-west of Nürnberg, with which it is connected by a railway, laid out in 1835, and the first that was completed in Germany. It has numerous churches, synagogues, a town-hall, theatre, &c. It is the most industrious and most prosperous manufacturing town of Bavaria; its mirrors, chandeliers, snuff-boxes, lead-pencils, its brass and wood wares, and its articles of dress, are famous. The making of metallic leaf, and the manufacture of articles in bronze, are most important branches of industry. F. also produces pinchbeck rings, watch-keys, brass nails, spectacles and optical instruments, in great abundance. An annual fair, lasting fourteen days, takes place at Michaelmas. Pop. (1871) 24,569, of whom 4000 are Jews, and the rest Protestants. F. first appears in history about the beginning of the 10th c., when it belonged to the archbishops of Bamberg. Subsequently it acknowledged the authority of the Burgrafs of Nuremberg. In 1634, during the Thirty Years' War, the Austrian Croats burned it to the ground. In 1680 a great fire almost laid it in ashes again. It first began to attain importance as a seat of manufactures in the latter half of the last century.

FURY AND HECLA STRAIT, lying in lat. 70° N., and long. from 82° to 86° W., separates Melville Peninsula on the south from Cockburn Island on the north, and connects Fox's Channel on the east with the Gulf of Boothia on the west. It is of no value whatever as a means of communication, nor is ever likely to be so, its western entrance having been ascertained by Captain Parry, who discovered it, on his second voyage, to be impenetrably closed from shore to shore by the accumulated ices of many years. It is traversed from west to east by a strong current, which passes down Fox's Channel into Hudson's Strait.

FURZE (*Ulex*), a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, distinguished by a two-leaved calyx with a small scale or bractea on each side at the base, stamens all united by their filaments, and a turgid pod scarcely longer than the calyx. The COMMON F. (*U. Europæus*), also called WHIN and GORSE, is a shrub about two or three feet high, extremely branched; the branches green, striated, and terminating in spines; the leaves few and lanceolate; the flowers numerous, solitary, and yellow. It is common in many of the southern parts of Europe and in Britain, although it does not reach any considerable elevation on the British mountains, and often the frost of severe winters; where seasons its flowers may be seen all winte there is an old proverb, 'Love is out of seaso the furze is out of blossom.' It is scarcely in any of the northern parts of Europ Linnæus is said to have burst into exclamat grateful rapture when he first saw a commo with F. bushes glowing in the profusion rich golden flowers. F. is sometimes plan hedges, but is not well suited for the purpo pying a great breadth of ground, and not acquiring sufficient strength; besides, it do when cut, tend to acquire a denser habit. useful as affording winter food for sheep, and account is burned down to the ground by farmers when its stems become too high and so that a supply of green succulent shoots secured. In some parts of Wales, F., chopp bruised, forms the principal part of the winter of horses. In some places, it is sown to yield food for sheep or other animals, but is prefer other green crops only on dry sandy soils, they could not be advantageously cultivat is most extensively cultivated in Flanders. chopped and bruised by means of a mal end of which is armed with knife-blades; means of a simple machine, called a gorse-m double-flowering variety is common in garde very beautiful variety, called IRISH F., b originally found in Ireland (*U. strictus* of botanists), is remarkable for its dense, c and erect branches. A dwarf kind of F. (*U.* occurs in some places, and is perhaps also a variety; if so, there is only one species known

In fox-hunting countries, F. is encourag account of the excellent *cover* it affords. It a favourite cover for rabbits.

FUSE, FUSEE, a tube of wood or metal forated down the side with a vertical row of and used for firing shells. The tube is filled a composition of nitre, sulphur, and gunpo which will burn gradually. The distance be each hole representing a second, the rang time of flight are computed, and that hole i open which will communicate the fire in the f the loaded shell at the moment the latter to the ground after being discharged. Of course, combustion reaches this aperture, the sh burst by the explosion of the contained gunpo and scattered around in numerous fragments. constructed on a similar principle are us exploding military mines (q. v.).

FUSEL or FOUSEL OIL, known POTATO SPIRIT, is a frequent impurity in distilled from fermented potatoes, barley, to which it communicates a peculiar and odour and taste, and an unwholesome Being less volatile than either alcohol or accumulates in the last portions of the liquor. According to Liebig, it is principall in the fermentation of alkaline or neutral while it never occurs in acidulous fermenta which contain tartaric, racemic, or citric mainly consists of a substance to which have given the name of amylic alcohol, w position is represented by the formula HO.C It is a colourless limpid fluid, which has ent and oppressive odour and a burn is only sparingly soluble in water, but with alcohol, ether, and the essential oi proportions. Any spirit which produces a appearance, when mixed with four or fiv volume of water, may be suspected to co

Fusel oil is principally sold in this c

f yielding pear essence for the so-called drops; it has likewise been patented as lar quinine; and according to Liebig, it is loyed in lighting distillery buildings.

H—RY, the second son of John Caspar a portrait-painter, and author of -s *Painters*, was born at Zurich d in his native town and at Berlin, —vater in 1761, and then went to by Reynolds's advice, he devoted In pursuance of this object, he r in 1770, where he remained for in particular the works of in 1778 returned to England. elected a member of the Royal , nine years later, he became pro-g. He died at Putney Hill, near April 1825, and was buried beside Joshua Reynolds, in St Paul's. His le works are 'The Ghost of Dion,' 'Lady Macbeth;' 'Hercules and the des;' and his 'Milton's Gallery,' designs from *Paradise Lost*. F.'s bold, but coarse; he had more and his execution was often spas-treme. His art-criticism, however, ranks among the best in the lan-works, with a narrative of his by Knowles (3 vols, London,

'Y. With few exceptions, all solids a high temperature without under-al change, may be melted. Many sub-h are popularly regarded as infusible le, platinum and flint—readily fuse ydrogen blow-pipe, or between the erful galvanic battery; even carbon lly fused by the last-named means. ny substances which cannot be melted are decomposed by the action of heat. many other organic compounds are certain gases, which escape, and fixed salts, which are left. Simi-e of lime (chalk) is decomposed into and lime at a temperature below If, however, we prevent the gas by confining the carbonate of lime closed gun-barrel, it can be melted heat.

ler of Fusibility of the Metals' his *Elements of Chemistry*, 2d

TAL. Fusible metal is composed muth, 1 of lead, and 1 of tin. It F. becoming pasty before it completely ds in a very anomalous manner; es regularly from 32° to 95°; it dually to 131 ; it then expands hes 176°, and from that point till nsion is uniform. The faculty of ools, while still in a comparatively he alloy very serviceable to the lows it to test the accuracy of h faithfully reproduced in of oy. The proportions of times varied, and another table in FUSING AND

a spindle) is represented and more acute than a

were formerly soldiers armed with ket than the rest of the army; regiments of foot carry the improved rifle. Fusilier is therefore simply a historical title borne by a few regiments—viz., the Scots Fusilier Guards, the 5th Northumberland, 7th Royal, 21st North British, 23d Welsh, 87th Irish, 101st and 104th Bengal, 102d Madras, and 103d Bombay Fusiliers.

FUSING AND FREEZING POINTS are terms applied to the temperature at which solids assume the liquid form, and liquids become solid. The following table gives some of the best determinations of the fusing-point:

Mercury, . . .	−39°	Alloy (1Sn,2Bi), .	286°
Oil of vitriol, .	−30°	„ (3Sn,2Pb),	383°
Bromine, . .	9°·5	Tin, . . .	451°
Oil of turpentine,	14°	Bismuth, . .	512°
Ice, ...	32°	Nitrate of soda, .	591°
Lard, . . .	91°	Lead, . . .	620°
Phosphorus, . .	111°·5	Nitrate of potash, .	642°
Potassium, . .	136°	Zinc, . . .	773°
Yellow wax, . .	143°·6	Antimony, (about)	900°
Stearic acid, .	158	Silver, . .	1773°
Sodium, . . .	207°·7	Copper, . . .	1996°
Fusible metal (5Pb,3Sn, 8Bi), ...	212°	Gold, . . .	2016°
Iodine, . . .	226°·4	Cast iron, . .	2786°
Sulphur, . . .	239°	Wrought iron, higher than . . .	3280°

We see from this table that alloys may have a fusing-point far below that of any of the metals which enter into their composition. Similarly, mixtures of various silicates fuse at a temperature far below that which is required to melt any one of them, and the same remark applies to mixtures of various chlorides, carbonates, &c.

Most solids, when heated to their fusing-point, change at once into perfect liquids; but some—as, for example, platinum, iron, glass, phosphoric acid, the resins, and many others—pass through an intermediate pasty condition before they attain perfect fluidity, and, in these cases, it is difficult, if not impossible, to determine the exact fusing-point. This intermediate condition is termed *vitreous fusion*, because it is a characteristic property of glass. It is in this intermediate state that glass is worked, and iron and platinum forged.

As a general rule, the freezing-point is the same as the fusing-point—that is to say, if a substance in the liquid form be cooled below the fusing-point, it again becomes solid; but there are cases in which we can cool a liquid several degrees below its fusing-point; thus, by keeping water perfectly still, we can cool it to 5°, or even to 1°·4 before it freezes. If, however, we drop a solid body into water in this condition, or if we shake the vessel containing it, congelation begins at once, and the temperature rises to 32°. This phenomenon is exhibited to a still greater degree in viscid fluids, like the oils. It is well known that the freezing-point of water is depressed by the presence of salts. Thus, sea-water freezes at about 26°·6, and a saturated solution of common salt must be cooled as low as 4° before freezing. Despretz has given the freezing-points of various saline solutions at different degrees of concentration in the fourth volume of the *Comptes Rendus*, p. 435.

FUSTIAN, a cotton fabric having a pile like velvet, but shorter, and which is manufactured in nearly the same manner as velvet—viz., by leaving loops standing upon the face of the fabric, and then cutting them through so as to form upright threads, which are afterwards smoothed by shearing, singeing, and brushing. See VELVET.

FUSTIC, a name given to two kinds of dye-wood used for producing a yellow colour, and with chemical additions, other colours, such as brown, olive, and green. The name seems to be derived from the French *Fustet*, the name of the Venice Sumach (*Rhus cotinus*, see SUMACH), a shrub found in the

alleled sufferings of the hapless fugitives
omen, and children. Pop. (1871) 10,335.

FPU'R, a town in the district of Saugur,
commissionership of the Central Prov-
ds on the Unjon, a tributary of the Ner-
out 20 miles from the point of junction,
22° 38' N., and long. 78° 38' E. It is
importance, as being the residence
ajahs.

DEBT is a debt wherein the obliga-
the time for payment is fixed and
day for performance has not arrived.
debt, it was said in the civil law *dies cedit*
venerit; and it was distinguished from
debt, i.e., a debt payable on the per-
a condition which was uncertain, in
as said *dies nec cedit nec venit*. Thus, an
to pay six months hence is a future debt;
ion to pay 'if my ship returns from Spain,'
nt. In the event of the death or bank-
a person having large commercial trans-
is often of great importance that the right
lers of such securities should be accurately
Rome, on the death or bankruptcy of
a creditor holding a claim for a future
entitled to payment, deducting a per-
portionate to the date at which his debt
le; but a contingent creditor only received
for payment in case his debt should
yable. This general principle has been
into the legal systems of modern states.
d and in France, the rights of creditors
ims not immediately payable are based
ule of the civil law. In England, a future
rder to found a valid claim, must be in
it may be constituted by bond, bill, or
r security. By common law, such a
not be enforced until the actual time
has arrived; and formerly, in case of
a creditor on a debt of this kind was not
ist in his claim. At the same time,
discharge was held not to release
bt which had not been admitted to
process; and hence debtors were some-
rated for years on debts which they
unable to discharge. See IMPRISON-
ENT. This state of things was pro-
manifest injustice on both debtor and
on the latter, by excluding him from
his claim at a time when he might have
payment; on the former, by
his default when he was deprived
of making any return. The subject
discussed in parliament before a
pplied. At last, by 6 Geo. IV. c. 16,
enacted that, in cases of bankruptcy,
t was not immediately payable, the
be entitled to prove his debt, and receive a dividend, deducting interest at 5 per cent. for the period which was to elapse before the date when the debt was payable in due course. By s. 56, debts payable on a contingency might be valued, and a dividend paid on the estimated value. Similar provisions were inserted in the 12 and 13 Vict. c. 106, ss. 172 and 177. By the last bankruptcy act, 24 and 25 Vict. c. 134, s. 153, it is enacted that a person having a claim for unliquidated damages, which are of the nature of a future debt, may have his claim assessed by a jury either in the court of equity, or before a common-law judge, or, in case of agreement between the parties, by the court without a jury.

By the common law of Scotland, the rule of the civil law, as to the rights of creditors having a future claim, has always been recognised. In the event of bankruptcy, creditors in both future and contingent debts are allowed to rank, but the latter only to the extent of receiving a security until the condition is purified. But by 19 and 20 Vict. c. 79, s. 53, which is now the ruling statute as to bankruptcy in Scotland, contingent creditors may have their debts valued, and may vote in the Sequestration (q. v.), and draw dividends proportionate to the valuation. It is also enacted, s. 14, that all creditors whose debts are not *contingent* may concur in the petition for bankruptcy. But the Scotch law affords to future debtors a further privilege, unknown to the system of the sister-country—viz., that of arrestment in security, whereby a creditor having a future claim is enabled, in case his debtor seem to be wilfully diminishing his means of discharging his debt, to attach the goods of the debtor as a security for the payment of his debt. See ARRESTMENT.

FYNE, LOCH, an arm of the sea running north and north-east from the Sound of Bute, in the south of Argyleshire, to beyond Inverary, in the north, and is bounded by the district of Cowal on the E., and by those of Argyle, Knapdale, and part of Cantire on the W. It is 43 miles long, 2 to 10 miles broad, and 40 to 70 fathoms deep. Its shores are deeply indented, and bordered by low bare hills, which rise higher and are wooded near Inverary. On the west side, it sends off a small branch leading to the Crinan Canal. Loch F. is celebrated for its herrings.

FYZABA'D, a rapidly decaying city of Oude, stands on the right bank of the Ghogra, here a navigable river, in lat. 26° 47' N., and long. 82° 10' E. Originally an appendage, as it were, of Ayodha or Oude, the ancient capital from which the country took its name, F. became, in 1730, itself the seat of government. But in 1775, immediately after the annexation of part of Rohilcund (see FUTEHGUNGE), it was supplanted by Lucknow, which lay about 90 miles to the west, in the direction of the newly acquired territory. Pop. (1871) 37,804.

ral way to designate every kind of indirect ut more especially the tax upon salt. This , first established in 1286, in the reign of pe IV., was meant to be only temporary, as declared perpetual by Charles V. It in the different provinces. Those that were heavily taxed were called *pays de grande* , and those that were least heavily taxed, *pays ite gabelle*. It was unpopular from the very nd the attempt to collect it occasioned fre- disturbances. It was finally suppressed in The name *gabelous* is, however, still given by n people in France to tax-gatherers.

ON (Ital. *gabbia*, related to Lat. *carca*, a hollow cylinder of basket-work, employed l or temporary fortification, and varying in a diameter of 20 inches to 6 feet, with a of from 2 feet 9 inches to 6 feet. In con- t, stout straight stakes are placed upright and in a circle of the required diameter, n wattled together with osiers or green as the formation of baskets. The appa- aised, when completed, from the ground, the ends are fastened, and the gabion is ready to be rolled to any place where it is desirable to form a breast-work against the enemy. Placed on end, and filled with earth, a single row of gabions is proof, except at the points of junction, against musketry fire, and by increasing the number of rows, any degree can be obtained. The gabion has of being highly portable, from its ith its aid a parapet can be formed earth, and therefore in less time, than allowance has to be made for the sides, which are necessarily present hen walls. The *sap-roller* consists ic gabions, one 4 feet, the other 2 meter, with the space between of pickets of hard wood. In , these serve as substitutes for

shion.

abions are gabions rammed full of broken small wood; being light in weight, ed before soldiers in the trenches, and not a very efficient, protection

nnade is a line of gabions thrown up by as a defence, after being driven back from solid positions. In carrying a well- gabionnade after gabionnade has be stormed before the besieged can be o surrender.

the triangular part of an exterior wall ng between the top of the side-walls and es of the roof. The whole wall of which forms the top is called a gable-end; party- walls which separate two contiguous which belong equally to both houses, Scotland 'mutual gables.'

is one of the most common and e features of Gothic architecture. The classic buildings had *Pediments* (q. v.), ed the slope of the roofs, but these low in pitch. In medieval architecture, very angle are used with the utmost and when covered with the moulded and copes of the richer periods of the style, at variety and beauty of outline. or small gables, are used in great profu- more decorative parts of Gothic archi- as canopies, pinnacles, &c., where they are introduced in endless variety along with tracery, crockets, and other enrichments.

The towns of the middle ages had almost all the gables of the houses towards the streets, producing great diversity and picturesqueness of effect, as may still be seen in many towns which have been little modernised. The towns of Belgium and Germany especially still retain this medieval arrangement. In the later Gothic and the Renaissance periods, the simple outline of the gable became stepped and broken in the most fantastic manner. See CORBIE STEPS.

In Scottish law, a mutual gable or party-wall, though partly built on the adjoining property, belongs to the builder, and he can prevent his neighbour from availing himself of it for the support of his house, until he has paid half the expense of building it. For the law of England on this subject, see PARTY-WALL.

GABOO'N RIVER, THE, takes its rise in the Crystal Mountains, a chain in Western Africa, running almost directly east and west, parallel to, and about 80 or 100 miles distant from, the coast. Flowing first in the direction of north to south, it afterwards curves toward the north, and empties itself into the Atlantic in lat. about 0° 30′ N., and long. 9° 10′ E. Its mouth forms a bay of some 10 or 12 miles in length, with a breadth varying from 7 to 15 miles. The total length of the river is said to be about 120 miles. The G. is deep and sluggish, the mass of its waters being tidal; 60 miles from its mouth the tide rises to a height of from seven to nine feet. The climate is unhealthy; but the profits of the trade in ivory, which is obtained abundantly in the territories through which the river flows, induced a French colony to settle and build a fort at the mouth of the river in 1842 or 1843. In the same year, an American mission, which still continues in active operation, was established at Baraka, about eight miles up the river. The Gaboon country, besides ivory - of which, when the home demand is brisk, it yields about 80,000 pounds annually—produces bar-wood, a dye-wood from which a dark-red dye is obtained, ebony, and copal of inferior quality. The banks of the river, from its source to the ocean, are occupied by about a dozen tribes, chief of which is the Mpongevé, who hold its mouth. This division of territory renders the ivory much more costly than it otherwise would be, the first owners in the interior not being allowed to take it direct to the white trader at the coast, but compelled to transmit it through the hands of the intervening tribes, each of whom makes a profit.

GABRIEL (Heb. the man or mighty one of God) is, in the Jewish angelology, one of the seven archangels. He appears in the book of Daniel as the interpreter of the prophet's vision (chap. viii.), and announces the future appearance of the Messiah (chap. ix. 21 - 27). In the New Testament, he reveals to Zacharias the birth of John the Baptist (Luke, i. 11), and to the Virgin Mary the birth of Christ (Luke, i. 26). According to the Rabbins, he is the angel of death for the people of Israel, whose souls are intrusted to his care. The Talmud describes him as the prince of fire, and as the spirit who presides over the thunder and the ripening of fruits. When Nebuchadnezzar besieged Jerusalem, G. is believed to have entered the Temple, by command of Jehovah, before the Assyrian soldiery, and burned it, thereby frustrating their impious intentions. G. has also the reputation among the Rabbins of being a most distinguished linguist, having taught Joseph the 70 languages spoken at Babel, and being, in addition, the only angel who could speak Chaldee and Syriac. The

Mohammedans hold G. in even greater reverence than the Jews, and regard him as the chief of the four most favoured angels who form the council of God; he is called the spirit of truth, and is believed to have dictated the Koran to Mohammed.

GACHARD, Louis Prosper, principal archivist of Belgium, was born in France about the year 1800. He was originally a compositor; but having removed to Belgium, he took part in the revolution of 1830, and was naturalised in 1831. In the same year he was appointed to the useful and honourable post which he still retains (1873). G. has spent much time in examining the documents relating to Belgian history, which are to be found in the national archives and in those of Spain. His principal writings are, *Analectes Belgiques* (1830); *Documents Politiques et Diplomatiques sur la Révolution Belge de* 1790 (1834); *Mémoires sur les Bollandistes et leurs Travaux depuis* 1773 *jusqu'en* 1789 (1847); *Correspondance de Guillaume le Taciturne* (1847—1851); *Correspondance de Philippe II., sur les Affaires des Pays-Bas* (1848—1851); *Correspondance du Duc d'Albe sur l'Invasion du Comte Louis de Nassau en Frise* (1850); *Retraite et Mort de Charles-Quint* (1854), and *Relation des Troubles de Gand sous Charles-Quint* (1856). Prescott speaks highly of his history of Charles V. In 1859, G. published historical documents bearing unfavourably upon the characters of Counts Egmont and Horn, which had the effect of stopping the erection of a monument to them. He issued, in 1863, *Don Carlos et Philippe II.*; in 1866, *Actes des Etats Généraux des Pays Bas*; in 1867, *Correspondance de Marguerite d'Autriche avec Philippe II.*; and, in 1869, *Jeanne la Folle.* In the same year, G. published *La Bibliothèque des Princes Corsini à Rome.*

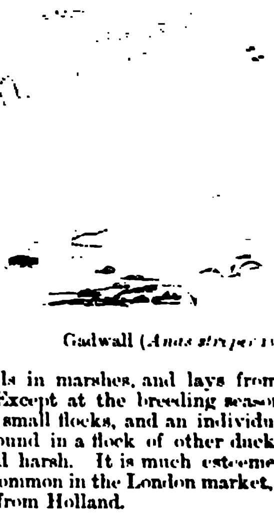
GAD, the first-born of Zilpah, Leah's maid, was the seventh son of Jacob. His name is differently explained.—The *tribe* of Gad numbered in the wilderness of Sinai more than 40,000 fighting-men. Nomadic by nature, and possessing large herds of cattle, they preferred to remain on the east side of Jordan, and were reluctantly allowed to do so by Joshua, on condition of assisting their countrymen in the conquest and subjugation of Canaan. Their territory lay to the north of that of Reuben, and comprised the mountainous district known as Gilead, through which flowed the brook Jabbok, touching the Sea of Galilee at its northern extremity, and reaching as far east as Rabbath-Ammon. The men of Gad—if we may judge from the eleven warriors who joined David in his extremity—were a race of stalwart heroes; 'men of might, and men of war fit for the battle, that could handle shield and buckler, whose faces were like the faces of lions, and were as swift as the roes upon the mountains' (1 Chron. xii. 8). Jephthah the Gileadite, Barzillai, Elijah the Tishbite, and Gad '*the* seer,' were also in all probability members of this tribe.

GADA'MES, or more accurately GHADAMES (the *Cydamus* of the Romans), the name of an oasis and town of Africa, the centre of divergent routes to Tunis, Tripoli, Ghat, and Tidikelt, is situated on the northern border of the Sahara, in lat. 30° 9′ N., long. 9° 17′ E., on the south-western boundary of the pashalic of Tripoli, and 310 miles south-west of the town of that name. It contains six mosques and seven schools; but the education offered to the young is limited to the reading of the Koran and a little Arabic writing. The gardens of G. grow dates, barley, wheat, millet, &c., and are watered by the hot spring (89° Fah.), from which the town had its origin. The climate is dry and healthy, though very hot in summer. The revenue of G., estimated at 10,000 mahboobs (£1700), is derived from annual tributes levied on property, and from custom dues and tolls. It is an important
for manufactures and foreign goods from T
the interior, and for exports of ivory, b
hides, ostrich-feathers, gold, &c., from the
to Tripoli. Previous to 1856, about 50
principally females, were annually importe
but in that year a decree was issued by th
peremptorily forbidding the traffic, which
ingly has been completely abolished. Po
who are devoted Mohammedans.

GAD-FLY. See Bot and Tabanus.

GA'DIDÆ, an important family of malac
fishes, having a moderately elongated body
with small soft scales, the head naked, the
soft and destitute of spines, the ventral fin
under the throat and pointed, one dorsal fin
the air-bladder large. Some of the species a
but others attain a large size. To this fami
the Cod, Ling, Hake, Dorse, Haddock,
Coal-fish, Burbot, &c. The species are wide
buted. Most of them are marine. A few
Burbot, are fresh-water fishes. The more im
species are separately noticed.

GA'DWALL (*Anas strepera*, or *Ch*
strepera), a species of duck, not quite so larg
mallard, a rare visitant of Britain, but abu
many parts of the continent of Europe, and
so in Asia and in North America. It is al
in the north of Africa. Being a bird of pas
a native both of arctic and of tropical region



Gadwall (*Anas strepera*).

G. breeds in marshes, and lays from seven
eggs. Except at the breeding season, it is
seen in small flocks, and an individual is s
to be found in a flock of other ducks. Its
loud and harsh. It is much esteemed for th
and is common in the London market, being
chiefly from Holland.

GÆA, or GE, according to the Greek myt
the goddess of the earth, appears in Hesiod
first-born of Chaos, and the mother of
Pontus, and many other gods and titans.

under the name of *Tellus*.

GAELIC LANGUAGE AND LITERAT
The term Gaelic (Gwyddelian or Gadhel) i
in two senses. In its wider signification, it de

the northern branch of the Celtic languages, comprehending the Irish, the Highland-Scottish, and the Manx. See CELTIC NATIONS and IRISH LANGUAGE AND LITERATURE. In its narrower signification, it designates the Highland-Scottish dialect, also known by the name of Erse or Irish. Mr W. F. Skene, one of the latest and best informed writers on the subject, holds that the differences between the language spoken by the Scotch Highlanders and the language spoken by the native Irish are (1) 'partly in the *pronunciation*, where the accentuation of the language is different, where that peculiar change in the initial consonant, produced by the influence of the previous word, and termed by the Irish grammarians eclipsis, is unknown except in the sibilant, where the vowel sounds are different, and there are even traces of a consonantal permutation; (2) partly in the *grammar*, where the Scottish Gaelic prefers the analytic form of the verb, and has no present tense, the old present being now used for the future, and the present formed by the auxiliary verb, where the plural of one class of the nouns is formed in a peculiar manner, resembling the Anglo-Saxon, and a different negative is used; (3) partly in the *idioms* of the language, where a greater preference is shewn to express the idea by the use of substantives, and the verb is anxiously avoided; and (4) in the *vocabulary*, which varies to a considerable extent, where words now obsolete in Irish are still living words, and others are used in a different sense.'—*The Dean of Lismore's Book*, introd. pp. xiv. xv. (Edin. 1862).

The origin of the differences thus described is a question still in dispute. Mr Skene contends that they are ancient, and enter into the organisation of the language. The Irish scholars, on the other hand, hold that they are comparatively modern and unimportant, and little more than provincial corruptions of the mother-language of Ireland. The late Mr Richard Garnett, one of the most learned of English philologists, is on the Irish side, holding 'that Irish is the parent tongue, that Scottish Gaelic is Irish stripped of a few inflections, and that Manx is merely Gaelic with a few peculiar words, and disguised by a corrupt system of orthography;' and, again, that the language of the Scottish Highlands 'does not differ in any essential point from that of the opposite coast of Leinster and Ulster, bearing, in fact, a closer resemblance than Low German does to High German, or Danish to Swedish.'—*Philological Essays*, pp. 202. 204 (Lond. 1859). That the north of Ireland, and the Scottish Highlands and West Islands, were, at an early period, peopled by the same race, or races, is admitted on both sides. Mr Skene further admits, that from about the middle of the 12th c. to about the middle of the 16th c., Ireland exercised a powerful literary influence on the Scottish Highlands; that the Irish sennachies and bards were heads of a school which included the West Highlands; that the Highland sennachies were either of Irish descent, or, if they were of native origin, resorted to bardic schools in Ireland for instruction in the language and the accomplishments of their art; that in this way the language and literature of the Scottish Highlands must have become, by degrees, more and more assimilated to the language and literature of Ireland; and that it may well be doubted whether, towards the middle of the [illegible] c. there existed in the Scottish Highlands [illegible] of acquiring the art of writing the [illegible] except in Ireland, or the conception of a [illegible] and cultivated literature, which was not [illegible] the language and learning of that [illegible] Skene holds, at the same time, that a [illegible] Gaelic, preserving many of the independent features of a native language, existed among the Scottish Highlanders as a spoken dialect; and that a popular and unwritten literature existed in that native and idiomatic Gaelic, in the poetry handed down by tradition, or composed by native bards innocent of all extraneous education in the written language of Ireland.

The first books printed for the use of the Scottish Highlanders were a translation of Knox's Prayer Book in 1567, by John Carswell, Bishop of the Isles; a translation of Calvin's Catechism, in 1631; a translation of the Psalms of David, begun in 1659, and completed in 1694; and a translation of the Bible, published by the Rev. Robert Kirke, minister of Balquhidder, in 1690. All these works are in the Irish orthography and Irish dialect; the last-mentioned work, indeed, is nothing more than a reprint of Bishop Bedell's Irish version of the Bible, with a short vocabulary of Scottish Gaelic words, to adapt it to the use of the Scottish Highlanders.

The first translations into the Scottish Gaelic were of Baxter's *Call to the Unconverted*, published in 1750; of the Psalms of David, in 1753, in 1787, and in 1807; of the New Testament, in 1767 and 1796; of Alleine's *Alarm*, in 1781; of the Old Testament, in 1783—1787, and in 1820; and of the Old and New Testaments, in 1826.

Vocabularies of the Scottish Gaelic were published in 1690, in 1702, in 1741, in 1795, and in 1815. The first Dictionary, by R. A. Armstrong, appeared in 1825; the largest and best was published under the auspices of the Highland Society of Scotland, in two quartos, in 1828. The best grammar is that of the Rev. Alexander Stewart, minister at Dingwall, published in 1801, and reprinted in 1812.

The oldest specimen of the written language connected with Scotland is the *Book of Deer* (see DEER), compiled in the twelfth century. The written language had, however, disappeared in Scotland during the next three centuries; as the oldest collection of *poetry* in the Scottish Gaelic, preserved in *The Dean of Lismore's Book*, compiled between 1511 and 1551, by Sir James Macgregor, vicar of Fortingall, and Dean of Lismore, is written phonetically. It is now in the Advocates' Library at Edinburgh. Selections from it have been published at Edinburgh (1862), with translations by the Rev. Thomas M'Lauchlan, as well into English as into modern Scottish Gaelic, and with a preliminary dissertation by Mr W. F. Skene. The volume contains nine pieces ascribed to 'Ossian, the son of Finn,' who speaks of himself as contemporary with St Patrick, and pieces by later and less known writers. The literary merit of the compositions is very slender.

The bibliography of the scanty literature of the Scottish Gaelic will be found in Reid's *Bibliotheca Scoto-Celtica* (Glasg. 1832). The modern names of most note are those of Robert Calder Mackay, or Robb Donn, as he is more commonly called in his native Sutherland, whose poems were published at Inverness in 1829; and Duncan Ban McIntyre, of Glenorchy, whose poems were published at Glasgow in 1834. The former was born in 1714, the latter in 1724; both were self-educated. The traditional prose literature has been collected and illustrated by Mr J. F. Campbell of Islay, in three pleasing volumes, *Popular Tales of the West Highlands* (Edin. 1860—1862).

Mr Skene has very clearly and fairly stated the long-disputed question as to the authenticity of the famous Poems of Ossian, published first in English, and afterwards in Gaelic, by Mr James Macpherson. The conclusions arrived at are: 1. That the characters introduced into Macpherson's poems were not invented by him, but were really the subjects removed to Heidelberg. In 1856, he published the life of his brother, General Friedrich von G.

GAGING, or **GAUGING**. When this term is used without qualification, it refers specially to the gaging of the contents of casks; and in many places, the popular name for the excise officer who measures the contents of casks containing excisable liquors is 'gauger.' Sliding scales, which are graduated according to the mathematical rules for determining the solid contents of regular solids approximating to the form of the casks, are used, but considerable practice and skill are required to apply them with accuracy.

GAILLAC, a town of France, in the department of Tarn, and on the right bank of the river of that name, is situated in a fertile vine-growing district, 32 miles north-east of Toulouse. It is ill built, and has no public building of any importance except the communal college. Distilling, tanning, ship-building, and a brisk trade in wine and brandy are carried on. Pop. (1872) 5694.

GAILLARD, **Gabriel Henri**, a French historian, was born at the village of Ostel, near Soissons, 26th March 1726. He was educated for the bar, but soon abandoned it for literature, and afterwards turned his attention exclusively to history. His first work was entitled *Essai de Rhétorique Française à l'Usage des jeunes Démoiselles*, &c. (1745), and the favourable reception which it met with induced him to publish his *Poétique Française à l'Usage des Dames*. In 1757 appeared his *Histoire de Marie de Bourgogne, Fille de Charles le Téméraire;* which was followed, in 1766, by the *Histoire de François I.*, and in 1782 by the *Histoire de Charlemagne, précédée de Considérations sur la première Race, suivie de Considérations sur la seconde Race, et contenant l'Eloge du Premier President de Lamoignon.* In a diffuse, one-sided, and rhetorical style, he represented the relations of France to England and Spain in his *Histoire de la Rivalité de la France et de l'Angleterre* (1771–1777) (which procured his admission into the French Academy), and *Histoire de la Rivalité de la France et de l'Espagne.* G. was the author of many other works. He wrote *Éloges* on Malesherbes (his intimate friend), Descartes, Charles V., Henry IV., Corneille, Molière, &c. He died 13th February 1806.

GAINSBOROUGH, a market-town and seaport of England, in the county of Lincoln, is situated on the right bank of the Trent, about 20 miles above the embouchure of that river in the Humber mouth, and 16 miles north-west of Lincoln. It is a well built town, consisting mainly of one long street, running parallel with the river, which is here spanned by a fine stone bridge of three elliptical arches. It was constituted a port in 1841. The most interesting of the buildings of G. is that called the Old Hall or Manor House, a portion of which has recently been converted into a Corn Exchange. It is said to have been occupied, or held in property, by the several lords of the manor of G. ever since the Saxons established themselves in this neighbourhood. Among the other public buildings are the parish church which, with the exception of a fine old tower, dating from the 12th c., was rebuilt in 1736, and the town-hall. There are also a grammar school, established in 1589, and other educational institutions; a literary institute and several libraries. G. is favourably situated in a commercial point of view, sea-going vessels being able to reach its wharfs by the river, while by means of the Keadby, the Chesterfield, and other canals, it maintains communication with the interior of the country. Vessels drawing twelve feet of water can ascend the Trent to the town. G. has important manufactures of linseed oil, and carries on malting, rope-making and ship-building extensively. Pop. (1871) of township, 7564.

GAINSBOROUGH, **Thomas**, one of the most eminent English landscape-painters, was born at Sudbury, in the county of Suffolk, 1727, and early displayed a decided talent for painting. 'Nature,' it has been said, 'was his teacher, and the woods his academy, where he would pass his mornings alone, making sketches of an old tree, a marsh, brook, a few cattle, a shepherd and his flock, or any other objects that casually came in view.' At 14 years of age, he was sent to London, where he was for some time with Mr Gravelot, the engraver, and afterwards with Hayman. At 19, he married, and set up in Bath as a portrait-painter, in which capacity he was very successful; but his genius first found adequate expression in the delineation of the rich and quiet scenery of his native country, and to this he mainly devoted himself after leaving Bath for London in 1774. On the institution of the Royal Academy, G. was chosen one of the first members, but never took much interest in its proceedings. He died August 2, 1788, of a cancer in the neck. His last words exhibited more the enthusiasm of the painter than the logic of the theologian: 'We are all going to heaven, and Vandyck is of the party.' G.'s portraits are remarkable as 'striking likenesses,' but are not carefully finished. The best are those of the Royal Family, of Abel the composer, and Quin the actor. His fame, however, rests chiefly on his landscapes; in these, he shews himself a faithful adherent to nature, as he knew it in his own beautiful island. He is, in fact, to be regarded as the first truly original English painter, and, in the opinion of Sir Joshua Reynolds, fit to be the head of an English school. Among his finest productions are, 'The Shepherd's Boy,' 'The Fight between Little Boys and Dogs,' 'The Seashore,' and 'The Woodman in the Storm.' His most celebrated picture is 'The Blue Boy,' in the Devonshire Gallery.

GAIUS, a Roman jurist, most probably of the age of the Antonines, and the chief source of our knowledge of Roman law prior to Justinian. Considering the important place which he holds in ancient legal literature, it is strange that his personal history should be almost entirely unknown, and that almost every circumstance connected with him should be a subject of controversy. The discussion as to whether the name is properly *Gaius* or *Caius* is a mere verbal dispute; but the questions regarding his country, his condition, and even his religion, have been canvassed at considerable length. From his being uniformly called by the single appellation G., it has been inferred that he was either a foreigner or a freedman: from his familiarity with the Greek language, some have argued that he was of Greek origin; from his being cited as 'our' G. by Justinian, who was a native of Illyricum, it is argued by some that G. must have been an Illyrian by birth; while others, arguing from the same fact, and from other equally inconclusive data, have even set him down as a Christian. That the last inference is a false one, cannot admit of a moment's doubt; the others, even if it were possible to settle them definitively, are of no practical importance. As to the precise age of G., thus much is certain, that before the revision of the Roman laws, and the reform of the legal studies by Justinian, the *Institutions* of G., as well as four other of his treatises, were the received text-books of the schools of law. His *Institutions*, moreover, formed the [illegible] work of the *Institutions* of Justinian. Fr [illegible] thus preferred to Ulpian or Papinian,

—by Baulet in 1826, by Domenget
lat in 1844. In England, it has
little notice, except in a few of the
ls, and there chiefly as a literary
has any English translation of the
appeared.
Wisigothorum, or *Breviarium*
ance a recast of the *Institutions* of G., published in 506 by Alaric for the use of the Roman subjects of the west Gothic kingdom. It is chiefly curious as illustrating the analogies and the discrepancies of Roman and barbarian law, and as supplying the germ of many of the medieval institutions by which Roman practice was supplanted. See, in addition to the editions of the *Institutions* enumerated above, Huschke, *Zur Kritik und Interpretation von Gaius Institutionen*, in his *Studien des Römischen Rechts*; also Mackeldey's *Lehrbuch des Römischen Rechts*; and Savigny, *System des heutigen Röm. Rechts*.

GALA WATER, a small river of Scotland, 21 miles in length, rises among the Moorfoot Hills in Edinburghshire, flows in a south-south-east direction through a beautiful and romantic country, and, forming in the lower portion of its course the boundary between Selkirk and Roxburgh shires, unites with the Tweed near Abbotsford.

GALA'CTIC CIRCLE (see GALAXY). This circle is to sidereal what the invariable ecliptic is to planetary astronomy, the ground plane of the sidereal system.

GALACTODENDRON. See COW-TREE.

GALACTO'METER, or **LACTOMETER**, a very simple instrument for testing the richness of milk; it consists of a glass-tube, graduated to 100 parts. New milk is poured in up to the top of the graduated part, and allowed to stand; and when the cream has completely separated, the value of its quantity is shewn by the number of parts in the 100 which it occupies. Another form of instrument was invented by Dörffel, consisting of a small hydrometer with a scale two inches long divided into 20 degrees, the zero being placed at the point which the instrument sinks in water, and the 20th degree corresponding with the density 1·0383. This instrument is preferred by the continental chemists; and 14 is held to shew milk undiluted with water.

GALACZ, an important town and river-port of Moldavia, the centre of the commerce of the whole Rumanian Principality, is situated on the left bank of the Danube, about three miles below the point where it is joined by the Sereth, and 92 miles from its mouth. It occupies a slope stretching gently down to the river, and is divided into an Old and New Town, the former consisting mostly of irregular one-storied houses, the latter built more after the fashion of Western Europe. With the exception of its churches and the residences of the foreign consuls, G. has no remarkable buildings. But its dockyard, its large bazaar, its numerous grain-stores, its magazines of eastern wares, and its rich banking establishments deserve notice. It is the principal emporium for the various produce of the Rumanian side of the Lower Danube, which is brought down to G. from the interior in bullock-carts, and thence shipped to foreign countries. The only cities on the whole of the great river that carry on a more extensive trade are Vienna and Pesth. The chief exports consist of wheat, wheat-flour, maize, barley, and rye; also of smaller quantities of oats, beans, millet, rape, and linseed. Other articles of produce are soft pine timber and planks, oak staves, tallow, wool, hides, petroleum, spirits, cheese, and salt fish. The increase in the commerce of G. during the last twenty years has been very great. In 1852, the total value of the exports amounted to £567,000, and of the imports to £442,000; while (according to the *Consular Report* for 1871) the average value, for the five years preceding the date of that report, of the exports and imports of G. and Brahilov (q.v.), of which at least one half must be assigned to G., amounted to about £3,000,000—Great Britain taking £1,500,000 of the former, and supplying £1,000,000 of the latter. The chief British imports are cotton goods, iron (bars and sheet), coal, coffee, agricultural machinery; and colonial produce, spices, drugs, tea, sugar, &c. In 1871 the number of ships that entered the Danube for G. and the other river-ports of Roumania was 1911, with a burden of 392,545 tons, Great Britain owning more than a third of the tonnage. The population of G. is estimated at 80,000, and forms a medley of Moldavians, Greeks, Jews, Armenians, Italians, French, English, and Germans.

GALAGO (*Galago* or *Otolicnus*), a genus of mammalia of the Lemur family, remarkable for the great length of the hind-legs, and the great size of the ears, which are membranous, and capable of being folded down as in bats. The head is rounded, the muzzle short, the eyes very large; all the feet have five toes, all the nails are flat, except those of the first digits of the hind feet, which are armed with sharp claws; the tail is very long, and almost bushy. The species are natives of Africa and Madagascar, varying from the size of a rabbit to that of a rat, more or less nocturnal in their habits, very lively and active, feeding partly on fruits and partly on insects; one of them (*G. Senegalensis*) is known in Senegal as the *gum animal*, from living much in acacias, and feeding, or being supposed to feed, on their gum. 'These pretty animals have all the activity of birds, leaping from bough to bough. They watch insects flitting among the leaves, listen to the fluttering of the moth as it darts through the air, lie in wait for it, and spring with the rapidity of an arrow, seldom missing their prize, which is caught by their hands.' When they leap, they always seize with their hands the branch on which they intend to rest. They make nests of grass and leaves for their young in the branches of trees. They are a favourite article of food in Senegal.

GALA'NGALE (*Alpinia*), a genus of plants of the natural order *Zingiberaceæ* or *Scitamineæ*, having perennial stems with terminal inflorescence and succulent fruit. The root-stocks possess stimulating properties similar to those of ginger. The true G. is the produce of *A. galanga*, a native of the Eastern Archipelago, and cultivated there; having a stem six or seven feet high, broad leaves, and a branched panicle of greenish-white flowers. The root stock, when young, yields a kind of arrowroot, and is used as an article of food; it acquires pungency and aromatic properties as it becomes older. G. is much used in the East for the same purposes as ginger.

GALA'NTHUS. See SNOW-DROP.

GALAPAGOS ISLANDS (so named from *galápago*, the Spanish word for *tortoise*) are a volcanic group in the Pacific, situated on or near the equator, and in long. between 89° and 92° W. They are thirteen in number, the largest measuring 60 miles by 15, with an elevation of 4000 feet. They can hardly be said to be peopled, being visited chiefly for their turtles, which are of enormous size. The ten principal members of the cluster are Albemarle, Indefatigable, Chatham, Charles, James, Narlborough, Hood, Barrington, Bindloes, and Abingdon.

GALASHIELS, the chief seat in Scotland of the Scotch tweed manufacture, occupies two miles of the narrow valley of the Gala, immediately above the junction of that river with the Tweed. It is 33½ miles south of Edinburgh, and 4 north of Melrose on the Waverley line. At its railway station are the junctions of a line to Selkirk, and of one that lies up Tweed valley to Peebles and the Caledonian.

rn frontier of Italy, whither
e preparations for a war with
He joined the camp towards the end of the year 169; but a pestilence breaking out, the emperors and their court set off for Rome, whither G. accompanied or followed them. On the return of M. Aurelius to the seat of war, G. obtained permission to be left at Rome, alleging that such was the will of Æsculapius, as revealed to him in a dream. How long G. stayed at Rome on this second occasion is not known, but we ascertain from his works that he attended M. Aurelius and his two sons, Commodus and Sextus, and that at about the end of the 2d c. he was employed to compound a celebrated medicine called Theriaca for the Emperor Severus. If the statement of one of his Arabic biographers be correct, who expressly says that G. was only twice at Rome, we must infer that the greater part of his middle and more advanced life was spent in that city. The place and date of his death are not known with certainty, but it is believed that he died in Sicily about the year 201.

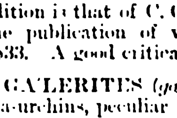
The works that are still extant under the name of G. consist, according to Choulant, in his *Handbuch der Bücherkunde für die ältere Medicin*, of 83 treatises acknowledged to be genuine; 19 whose genuineness has been questioned; 45 undoubtedly spurious; 19 fragments; and 15 commentaries on different works of Hippocrates. Besides these, he wrote a great number of works whose titles only are preserved, and altogether it is believed that the number of his distinct treatises cannot have been less than 500.

We may divide his works into (1) those on anatomy and physiology; (2) those on dietetics and hygiène; (3) those on pathology; (4) those on diagnosis and semeiology; (5) those on pharmacy and materia medica; (6) those on therapeutics, including surgery; (7) his commentaries on Hippocrates; and (8) his philosophical and miscellaneous works. We have most of these works in Greek, the language in which they were originally written; some are, however, preserved only in Latin translations, and a few only in Arabic. His most important anatomical and physiological works are *De Anatomicis Administrationibus*, and *De Usu Partium Corporis Humani*. Of the latter, Dr Greenhill (Smith's *Dictionary of Greek and Roman Biography*) remarks that 'it is no less admirable for the deep religious feeling with which it is written, than for the scientific knowledge and acuteness displayed in it.' For a good general account of G.'s anatomical and physiological knowledge, we may refer to a memoir published by the late Professor Kidd of Oxford in the sixth volume of *The Transactions of the Provincial Medical and Surgical Association*, entitled 'A Cursory Analysis of the Works of Galen, so far as they relate to Anatomy and Physiology,' and Daremberg's *Exposition des Connaissances de Galien sur l'Anatomie, la Physiologie, et la Pathologie du Système Nerveux* (Paris, 1841), may also be consulted with advantage. His anatomical and physiological writings are by far the most valuable of his works. They contain undoubted evidence of his familiarity with practical anatomy; but whether he derived his knowledge from dissections of human bodies or those of the lower animals, is uncertain. The latter is the most probable view - (1) because he frequently recommends the dissection of apes, bears, goats, &c.; and (2) because he mentions, as something extraordinary, that those physicians who attended the Emperor M. Aurelius in his wars against the Germans had an opportunity of dissecting the bodies of the barbarians. Much curious information regarding G.'s views on dietetics and hygiène will be found in Adams's *Commentary on the First Book of Paulus Ægineta*. His pathology was very speculative and imperfect. In his diagnosis and prognosis, he laid great stress on the pulse, on which subject he may be considered as the first and greatest authority, for all subsequent writers adopted his system without alteration. He likewise placed great confidence in the doctrine of critical days, which he believed to be influenced by the moon. In materia medica, his authority was not so high as that of Dioscorides. Numerous ingredients, many of which were probably inert, enter into most of his prescriptions. He seems to place a more implicit faith in amulets than in medicine, and he is supposed by Cullen to be the author of the anodyne necklace, which was so long famous in England. We cannot attempt to enter into his system of therapeutics. We may, however, observe, that his practice is based on two fundamental principles—(1) that disease is something contrary to nature, and is to be overcome by that which is contrary to the disease itself; and (2) that nature is to be preserved by that which has relation to nature. Hence arise two general indications of treatment—the one taken from the affection contrary to nature, which affection requires to be overcome; the other from the strength and natural constitution of the body, which requires to be preserved.

Before G.'s time, the medical profession was divided into several sects, who were always disputing with one another; as, for example, the Dogmatici, Empirici, Eclectici, Pneumatici, and Episynthetici. After his time, all these sects seem to have merged in his followers. The subsequent Greek and Roman medical writers were mere compilers from his writings; and as soon as his works were translated (in the 9th c.) into Arabic, they were at once adopted throughout the East, to the exclusion of all others. In short, G. reigned paramount throughout the civilised world till within the last 300 years. The records of the London College of Physicians afford a striking illustration of this fact, in so far as England is concerned. In 1559, Dr Geynes 'was cited before the college for impugning the infallibility of Galen. On his acknowledgment of his error and humble recantation, signed with his own hand, he was received into the college.'

The Greek text has been published four times. The first edition was the Aldine, printed in 1525, in 5 folio volumes; the latest and most accessible edition is that of C. G. Kühn, in 20 octavo volumes, the publication of which extended from 1821 to 1833. A good critical edition is still required.

GALERITES (*galerus*, a cap), a genus of fossil sea-urchins, peculiar to and abundant in the Chalk measures. The generic name, as well as that popularly given to them in the districts where they abound, viz., 'Sugar-loaves,' is descriptive of the elongated and more or less conical shape of their shell. The body in breadth is nearly circular or polygonal. The under surface is entirely flat, and has the mouth placed in its centre, with the vent near the margin. There are five avenues of pores reaching from the mouth to the summit. These fossils are often found silicified. The species figured is one of the most abundant; it has received its specific name from its resemblance to the white caps worn by the priests of Jupiter.



Galerites Albogalerus.

GALERIUS, VALERIUS MAXIMIANUS, a Roman emperor of humble parentage, was born near Sardica, in Dacia, entered the imperial army, and rose from one grade of military rank to another, until Diocletian conferred on him, along with C stantius Chlorus, the title of Cæsar (292 A.D.), gave him his daughter in marriage. On the a cation of Diocletian (305 A.D.), he and Constan became *Augusti*, or joint-rulers of the Roman em On the death of Constantius at York (306 A.D. troops in Britain and Gaul immediately decl their allegiance to his son, Constantine (afterw Constantine the Great), much to the chagrin of who expected the entire sovereignty of Rome fall into his hands. He died in 311 A.D. GALIA'NI, FERDINANDO, an Italian savant, born in Chieti, a province of the Abruzzi, in 1 and exhibited at an early period an extraordin aptitude for learning. Philosophy, history, ar ology, and more especially the science of polit economy, were his favourite studies; but, nevert less, he first attracted notice by a clever squi the death of the public executioner. This consi of a collection of essays eulogistic of the decea in which the style of the president and lea members of the Neapolitan Academy was a ably imitated. It was entitled, *A Collectio Papers in honour of Domenico Jannacone, Pu Executioner, revised and issued by the Presiden the Academy, Gian Antonio Sergio, Advocate*, excited universal comment in Naples. The yo delinquent was condemned to a period of seclus prescribed for penitential exercises. His next p lication, *Della Moneta*, was more deserving o pen, and evinced his great learning and powers reflection. It must be regarded as a valuable c tribution to the science of political economy. leading principle which it seeks to establish is, t coin is a merchandise, and that its value and inte ought to be left free like other goods. By adoption of the sage monetary doctrines propoun by an economist, who barely numbered 20 ye the financial ruin of Naples is said to have b then averted. In 1751, he visited the chief ci of Italy, and was everywhere honourably receiv From Pope Benedict XIV. he received repea proofs of favour and confidence. Having contrac during his travels intimate friendships with som the most famous naturalists of his country, he im diately entered with enthusiasm into their purs and on his return to Naples collected a rich ass ment of the stones and volcanic matter of Vesuvi which he subsequently presented to the p accompanied by a learned thesis. On one of stone specimens, he engraved the following tive inscription, '*Beatissime pater, fac ut lap— panes fiant;*' and received, by way of answer, rich prebend of Amalfi, for which he had previo qualified himself by entering into holy orders. 1759, he became secretary to the Neapolitan Emba at Paris, where his wit, vivacity, and learning m him a universal favourite. In 1767, he visi England, whose social and political instituti he studied deeply. On his return to Paris, wrote another treatise on political economy, entit *Dialoghi sul Commercio del Grano* (Dialogues u the Trade in Corn), in which he argues against b

rotectionists and the pure free-traders.
l to Naples, he was successively
arious posts of trust and importance.
Naples in 1787, leaving behind him rare

GALICZ. See Halicz.

GA'LILEE, the name applied to a porch or chapel placed at the entrance to a church, beyond which women were not permitted to pass. In abbeys, for example, the monks came to the galilee to see their female relatives. A portion of the nave was sometimes marked off by a step, or, as at Durham, by a line of blue marble, to mark the boundary to which women were limited. There are fine specimens of galilees at Lincoln, Ely, and Durham.

GALILEE (Heb. *Galil*, a 'circle' or 'circuit') is the name originally applied to a small district belonging to the Jewish tribe of Naphtali (see Josh. xx. 7). Here were situated the 20 towns which Solomon gave to Hiram, king of Tyre, for his assistance in building the temple. Phœnician colonies, in consequence, appear to have established themselves here, or the towns perhaps reverted by some chance to their original Canaanitish occupants, for at a later period we find Isaiah (ix. 1) speaking of the district as 'Galilee of the nations.' These 'nations,' or Gentiles, appear to have greatly increased in numbers, and to have finally spread themselves over all the surrounding country, until, in the time of our Lord, the name 'Galilee' embraced the whole northern portion of Palestine from the Mediterranean to the Jordan. As early as the time of the Maccabees (book I. chap. v. verses 20–23), the number of Jews in G. was very small; Strabo, a contemporary of Christ, states that in his day it was mainly inhabited by Syrians, Phœnicians, and Arabs, to whom Josephus adds Greeks. The principal towns at the dawn of Christianity were Tiberias, Tarichæa, and Sepphoris; those that figure in the gospels are Cana, Capernaum, Nazareth, and Nain. The Jewish inhabitants of G. spoke a broader and coarser dialect than their southern brethren of Judæa, and were held in low estimation by the latter, partly on account of their more liberal sentiments in regard to religion. It has been thought likely that this liberality, the existence of which is indisputable, was owing to their intercourse with their different heathen neighbours. Every one of the disciples was a Galilean either by birth or residence, and consequently may not have been a *Jew* at all in the strict sense of the term; i.e., in being able to boast of having 'Abraham for his father.' The first three gospels are chiefly taken up with records of the Saviour's ministrations in this province. After the destruction of Jerusalem, the despised G., as if retributively, became the refuge of the proud doctors of Jewish law, and the city of Tiberias the seat of Rabbinical learning. The ruins of many fine synagogues are still extant in the old towns and villages of this region. At present, G. belongs to the pashalic of Damascus, in the Turkish province of Syria or Soristan, and, as of yore, is remarkable for its beauty and fertility. It still has a considerable number of Jewish inhabitants.

GALILEI, Galileo, the creator of experimental science, was born at Pisa on the 15th of February 1564. He belonged to a Florentine family more ancient than opulent. G., by desire of his father, exclusively directed his early studies to medicine, and the prevailing Aristotelian philosophy, the dogmas of which he soon ventured to disbelieve and despise. At the age of eighteen he made one of his most important discoveries. Happening on one occasion to observe, in the cathedral of Pisa, the oscillation of a lamp casually set in motion, G. was struck with the apparent measured regularity of its vibrations; and having tested the correctness of this observation by comparing the beat of his own pulse with the action of the pendulum, he concluded that by means of this equality of oscillation a simple pendulum (q. v.) might become an invaluable agent in the exact measurement of time. This discovery he subsequently utilised by the successful application of the pendulum in constructing a clock for astronomical purposes. G.'s irrepressible bias towards mechanical constructions and experimental science received a new impulse from his intercourse with a friend of his father's, Ostilio Riccio, professor of mathematics, who, in compliance with the youth's entreaties, initiated him into the principles of mathematics. Such was G.'s absorption and delight in his new studies, that his father at length sanctioned his abandonment of the art of medicine, in order that he might concentrate his powers on his chosen sciences. The first fruit of his geometrical investigations was the invention of a hydrostatic balance, by which the specific gravity of solid bodies might be ascertained with the nicest accuracy. In 1589, the fame of G.'s extraordinary learning having reached the Grand Duke of Tuscany, this enlightened prince appointed him professor of mathematics in the university of Pisa, where he covertly inculcated many of those great innovations in physical science which have since added such lustre to his memory. About this period he turned his attention to the then very imperfectly comprehended laws of bodies in motion; and in opposition to all received systems, he propounded the novel theorem, that all falling bodies, great or small, descend with equal velocity. This soon led him to the discovery of 'the *three* laws of motion,' and the law regulating the motion of falling bodies, which is expressed by the formula $S = \frac{1}{2} ft^2$. This theory of falling bodies was proved correct by several experiments which were made from the summit of the leaning tower of Pisa, greatly to the chagrin of the Aristotelians, whose enmity to G. now grew more decided. In consequence, he deemed it prudent to relinquish his chair at Pisa, and retired to Padua, where he accepted the offer of the Venetian senate to lecture on mathematics in the university for the space of six years. It is also said, however, that G. lost his chair at Pisa, from having ridiculed the mechanical pretensions of John de' Medici, son of Cosmo I. G.'s engagement at Padua was eventually prolonged to the term of 18 years; but so urgent was his desire to return to his birthplace, that he sought a restoration to his former post at Pisa, and was gratified by an assent being eagerly accorded by Cosmo de' Medici, with exemption from any but a voluntary exercise of the duties of the professorship. During his sojourn at Padua, his course of lectures enjoyed extraordinary popularity; crowds of pupils flocked to hear him from all parts of Europe; and he was the first to adapt the Italian idiom to philosophical instruction. Among the various and noble discoveries with which he enriched science, may be noticed a species of thermometer, a proportional compass or sector, and more important than all, the construction of the refracting telescope for astronomical investigation. In 1609, he offered his first complete telescope to the Doge of Venice, Leonardi Deodati, by whom it was tested from the tower of St Mark with equal surprise and delight. In the same year he constructed a microscope; and then this indefatigable interpreter of the mysteries of nature commenced his astronomical researches by means of his own telescope. He speedily concluded that the moon, instead of being a self-luminous and perfectly smooth sphere, owed her illumination to reflection, and presented an unequal surface, deeply furrowed by valleys and mountains of great extent. The Milky Way he pronounced a track of countless separate stars; and these discoveries were crowned by a still more important series of observations, which led to the discovery of the four satellites of Jupiter on the night of the 7th of January 1610 (though it was not till the 13th of the same month that he came to the conclusion that they were satellites, and not fixed stars), which he named the Medicean stars, in honour of his constant protectors in that family. He also was the first to note movable spots on the disc of the sun, from which he inferred the rotation of that orb. Encircled by the lustre of these sublime discoveries, he departed from Padua, and returned to Tuscany in 1610, where renewed quarrels with the Aristotelians disquieted and embittered his existence. In 1611, he visited Rome, and was received with great distinction, being enrolled a member of the Lincei Academy; but four years later, on repeating the visit, his reception was widely different, as by that time in his work on the solar spots he had openly advocated the Copernican system, and was in consequence denounced as a propounder of heretical views. He repaired again to Rome, to demand an experimental inquiry into the soundness of his views; but the grand duke apprehending inquisitorial dangers for his favourite, summoned him back to Tuscany; at the same time the pope, through the famous Cardinal Bellarmine (a sincere friend of G.'s), commanded him to abstain from all future advocacy of his heretical doctrines. Some time after, he wrote his most famous work in the form of a dialogue between three fictitious interlocutors, the one in favour of the Copernican system, the second an advocate of the Ptolemaic, and the third a rabid supporter of the Aristotelian school. Of course, the whole weight of the *proof* falls into the Copernican scale; and nothing can exceed the classic beauty of this composition, or the compactness of the chain of its argument. In 1630, G. contrived to obtain the papal imprimatur, which was subsequently revoked; but having got a similar authorisation at Florence, he published, in 1632, this exponent of his opinions under the title of *Un Dialogo intorno i due Massimi Sistemi del Mondo.* Hardly had the work been issued, when it was given over to the jurisdiction of the Inquisition. Pope Urban, previously Cardinal Barberini, and, until now, a friend and eulogist of G., was led to believe that G. had satirised him in the work under the title of *Simplicio*, as one who is careless about scientific truth, and who timidly adheres to the saws of antiquity. He resolved to punish the audacious philosopher. In spite of his 70 years and heavy infirmities, G. was summoned before the Inquisition to answer for his heresies. After a wearisome trial and incarceration, his judges condemned G. to abjure by oath on his knees the sublime truths of his scientific creed. This he was weak enough to do. His latest biographer, M. Philarète Chasles, however, denies that G. was put to the torture, and pronounces the letter of G. to Reinecci, from which Tiraboschi quotes to prove it, a forgery. His famous whisper, *E pur si muove* ('But nevertheless it does move'), is also in danger of being regarded as a fiction. G. was sentenced to an indefinite term of imprisonment in the Inquisition, which was soon commuted by Pope Urban, at the request of Ferdinand the Grand Duke of Tuscany, into permission to reside at Siena, and finally at Florence, should the prisoner's health require the change. In his retreat at he continued with unflagging ardour his researches, even when hearing grew enfeebled sight was extinguished. He died on January 1642, at the age of 78, and wa

Vie, son Procès, et ses Contemporains,
les Documents Originaux (Paris, 1862). We
iefly recapitulate G.'s most important contributions to physical science under the following heads: 1. The relation between space and time in the case of falling bodies, also the 'three laws of motion;' 2. The path of projectiles is a parabola; 3. The isochronism of the pendulum; 4. That air has weight, also partial discovery that suction is owing to the pressure of the atmosphere; 5. The re-invention of Aristotle's theory respecting sound; 6. The invention of the telescope; 7. The discovery of the satellites of Jupiter, phases of Venus, and spots on the sun. For the nature of these discoveries, see PENDULUM, FALLING BODIES, PROJECTILES, &c.

GALL. A synonym for bile, the secretion of the Liver (q. v.)

GALL, FRANZ JOSEPH, the founder of phrenology, was born at Tiefenbrunn, near Pforzheim, on the borders of Baden and Würtemberg, 9th March 1758. He studied medicine at Vienna, and settling there, became known as a practical physician, and by the publication of his *Philosophisch-Medicinische Untersuchungen über Natur und Kunst im gesunden und kranken Zustande des Menschen* (Vienna, 1791). But he acquired a much more extended reputation by his lectures on the structure and functions of the brain, which he began to deliver in 1796. See PHRENOLOGY. His views were so subversive of received doctrines on the subject of mind, that a spirit of opposition was excited, and the lectures were prohibited in 1802 by the Austrian government. Along with his pupil Dr Spurzheim (q. v.), who became his associate in 1804, G. quitted Vienna in 1805, and during his travels through Germany, Holland, Sweden, and Switzerland, expounded his views in many of the universities and principal cities, where he found many adherents as well as opponents. In 1807, he settled as a physician in Paris, and there began lecturing and writing for the propagation of his opinions. As a foreigner teaching science to the French, he was discountenanced by Napoleon. On 14th March 1808, he and Spurzheim presented to the Institute of France a Memoir of their discoveries, on which a committee of the members of that body (including Pinel, Portal, and Cuvier) drew up an unfavourable *Report*. Of this there is a translation in the *Edinburgh Medical and Surgical Journal* for January 1809. G. and Spurzheim thereupon published their *Memoir*, with a reply to the *Report*, in a volume entitled *Recherches sur le Système Nerveux en général, et sur celui du Cerveau en particulier; suivi d'Observations sur le Rapport*, &c. (Paris, 1809, 4to). This was followed by their larger work, *Anatomie et Physiologie du Système Nerveux*, &c. (Paris, 1810–1819, 4 vols. 4to), with an Atlas of 100 plates; but the two phrenologists having parted in 1813, the name of G. alone is prefixed to vols. 3 and 4; and it alone is borne by a reprint of the physiological portion of the work, entitled *Sur les Fonctions du Cerveau, et sur celles de chacune de ses Parties* (Paris, 1825, 6 vols. 8vo). Of the contents of that edition, there is a summary in the *Phrenological Journal*, x. 459. A German translation of it, entitled *Vollständige Geisteskunde*, &c., appeared at Nuremberg in 1833; and an indifferent English version by Dr Winslow Lewis, junior, at Boston, United States, in 1835 (6 vols. 12mo). A translation of the chapters *On the Functions of the Cerebellum* is included in a volume with that title, published by G. Combe (Edin. 1838, 8vo). In answer to accusations of materialism and fatalism brought against his system, G. had early published a part of the work under the title of *Des Dispositions innées de l'Ame et de l'Esprit*, &c. (Paris, 1812). He continued to practise medicine and pursue his researches at Montrouge, near Paris, till his death, 22d August 1828. A catalogue of his collection of skulls, &c., is printed in the *Phrenological Journal*, vols. vi. and vii. As a thinker, he was original and independent; as an observer, industrious and persevering; as a writer and lecturer, forcible and clear. Even those who reject his system as insufficiently borne out by facts, allow that he has conferred signal service on science by his discoveries in the anatomy and physiology of the brain, and that by stirring to the bottom many questions regarding mind, and the organic conditions by which its phenomena are affected, he has contributed to deepen the foundations of psychology, and to render it applicable to human affairs. It is long since the apprehension of danger to religion and morality from his doctrines died away among the intelligent and well informed. In Great Britain, phrenology became known less through G.'s writings than through those of Spurzheim, who came over to England in 1814. So early, however, as 1803 it had been criticised in the *Edinburgh Review*, ii. 147. See further, *Transactions of the Phrenological Society*, p. 1 (Edin. 1824); *Phrenological Journal*, vols. 5, 8, 9, 11, 15, 16, 17, and 19; a *Historical Notice of the Discovery of the Anatomy of the Brain*, appended to G. Combe's *Phrenology Applied to Painting and Sculpture*, p. 151 (Lond. 1855); Professor Laycock on *Mind and Brain*, ii. 164, 168 (Edin. 1860).

GALL, ST, one of the most important manufacturing towns of Switzerland, capital of the canton of the same name, is pleasantly situated on the left bank of the Steinach, at an elevation of 2081 feet above sea-level, and is distant 40 miles from Zürich in a straight line east-north-east. It is a well-built town, surrounded by old walls; but the ditch has been filled up and converted into garden-grounds. Among the principal buildings are the Abbey Church, which was completely modernised in the course of last century; the monastery, portions of which are now occupied by public government offices, and by the convent library, containing 1506 MSS., and among them several of the classics, that were at one time thought to have been lost. See GALL, ST, ABBEY OF. The greatest building is the schoolhouse, which contains a natural history museum and the town library. The manufactures of St G. consist chiefly of cotton goods, particularly of *Swiss muslins*. It has also linen manufactures, carries on bleaching and embroidery extensively, and is the great mart for the produce of Appenzell and Thurgau. Pop. (1870) 16,675.

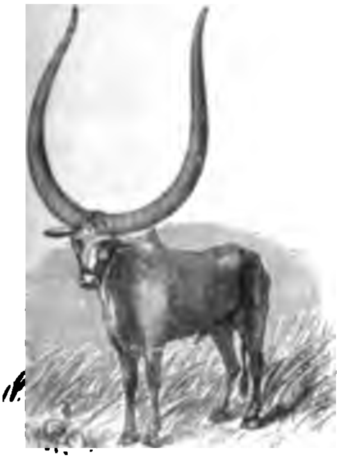
GALL, ST (Ger. *St Gallen*), ABBEY OF, a celebrated Swiss Benedictine monastery, which gives its name to the canton in which it is situated. It was founded early in the 7th c. by St Gall, or Gallus, an Irish monk, a disciple of Columbanus, and one of that distinguished band, who in that age, from the various monasteries of Ireland and the kindred establishment of Iona, carried the elements of learning and civilisation over a large portion of the continent of Europe. Gallus had accompanied Columbanus to Anegray and Luxeuil, and ultimately himself, in company with a few followers, repaired to Switzerland, where, in a hermitage on the banks of the Steinach, he acquired such fame for sanctity by his teaching and example, that on his death, there arose, in honour of his memory, what, in progress of time, became one of the most celebrated of the many magnificent establishments of the Benedictine order. The succession of abbots from the days of Gallus is carefully chronicled, and the share which each of them had in the erection and enlargement of the monastic buildings. It will be enough to say that, through the piety and munificence of the faithful, the abbey of St G. gradually became one of the master-pieces of medieval architecture; and that the genius and skill which were lavished on its construction, and on the decoration of its halls and cloisters, had a large share in developing the Christian art of the period. The monks of St G., too, may be reckoned among the best friends and preservers of ancient literature. They were indefatigable in the collection and transcription of MSS. biblical, patristic, sacred and profane history, classical, liturgical, and legendary. Some of the MSS. which are still shewn in the library are monuments of the skill and industry of the copyists; and several of the classics, especially Quintilian, Silius Italicus, and Ammianus Marcellinus, have been preserved solely through the MSS. of St Gall. For a time, the abbey was subject to the Bishop of Constance, and an animated dispute was for a long time maintained between that prelate and the monks as to the right of electing the abbot. It ended, however, in the recognition of the right of free election; and ultimately, from the growth of the monastic possessions, and the important position which the abbot held, the monastic domain, which comprised a great part of Northern Switzerland, became a distinct jurisdiction, within which the abbot, like many of his brethren in the great Benedictine monasteries, exercised all the rights of a suzerain. For several centuries, the abbey of St G. held one of the highest places in the order. Its schools enjoyed wide reputation. Its members held a distinguished place among the scholars of medieval Germany; and many of them, as, for example, Notker, are known to have cultivated not only the ordinary learning of the schools, but also physic, mathematics, and astronomy. The school of St G., too, was one of the most eminent for the cultivation of music, and its MSS., preserved in its library, have been extensively made use of by the restorers of ancient ecclesiastical music. A town of considerable importance grew up around the monastery, and was called by the same name; and as the wealth and influence which attached to the dignity of the abbot began to make it an object of ambition to the rich and powerful families, we find the succession of abbots, in the 13th and 14th centuries, sadly degenerated from their pious and learned predecessors in the office. A stringent reform was enforced about the time of the council of Constance; but the burghers of St G. had grown dissatisfied under this rule; and on the outbreak of the Reformation in 1525, they threw off their subjection, and embraced the new doctrines. At the close, however, of the religious war in 1532, the Catholic religion was re-established, and the abbot reinstated, though with diminished authority, in his ancient dignity. At the French Revolution, the abbey of St G. was secularised (1798), and its revenues were soon afterwards sequestrated (1805). By a later ecclesiastical arrangement, the abbey of St G. was raised to the dignity of a bishopric, which, in 1823, was united to that of Chur. They were afterwards, however, separated; and in 1847, St Gallen was erected into a bishopric, with a distinct jurisdiction.

GALL, ST, CANTON OF, a Swiss canton, bounded on the N. by Thurgau and the Lake of Constance, E. by the Vorarlberg, S. by the Grisons and Glarus, and W. by Zürich and Schwytz. The country is for the most part mountainous: the general slope of the surface being towards the north and north-west. Several of the summits attain a height of 6000 or 7000 feet, one (the Gallanda) a height of 8800, and one (Schirle) that of 9000. The Rhine touches the canton of St G. near Pfeffers, and for about 50 miles forms its eastern boundary. The chief rivers that intersect the canton are the Seez, the Tamina, and the Thur. Portions of the Lakes of Constance, Zürich, and Wallenstadt, lie within its boundaries. The chief produce of the canton consists of fruit, especially apples and cherries, wine, *kirschwasser*, corn, maize, and potatoes. The amount of corn produced is but trifling, and a considerable part of the land is devoted to pasture. Iron is found in considerable abundance, and of good quality, at Gunzenberg; and coal, as also peat, is raised within the canton.

es are of linen, muslin, cotton, lace, , and glass; and wax-bleaching and also extensively carried on. The linen- of very old standing. Its seat is the town all, which was celebrated for its linens as the 13th c., but it has in later times been entirely replaced by the manufacture of

ection of St G. into a distinct canton is ively of recent date. It was formed upon isation of the domain of the abbot by of the abbey territory with several dis- reviously subject to the older cantons—viz., inthal, Sargans, Werdenberg, Sax, Gaster, h, together with the town of Rapperschwyl; the new canton of St G. actually encloses sides the canton of Appenzell, which forms, ere, an island within the new district. The is a Swabian dialect of German. The G. sends eight members to the National its government is one of the most demo- Switzerland. It consists of a Great Council, ers of which are chosen for two years by of all citizens above 21 years; and who among themselves for four years , called the Lesser Council, consisting mbers. The local prefects and other rs are elected annually in their several The area of the canton is 772 square (1870) 191,015, of whom about 120,000 olics, and the rest chiefly Calvinists. own, St Gall (q. v.).

LA OX, or **SANGA**, a remarkable species iety of ox inhabiting Abyssinia. The chief rity is the extraordinary size of the horns, rise from the forehead with an outward, and n inward curve, producing a very perfect of a lyre, and finally curve a little outwards



Ox (copied from Youatt's work on *The Ox*).

tip, to which they taper gradually. In a en presented by Mr Salt to the Museum of llege of Surgeons in London, the length of orn measured round the outer curve is three and a half inches, the circumference of each base is one foot three inches, the distance n the tips three feet four inches. A piece of three or four inches between the horns is d by a tuft of hair. Bruce represents the ous growth of the horns as a kind of dis- r monstrosity, accompanied with emaciation animal. Salt controverts this account, but figures the animal so as rather to confirm it. The G. O., however, differs from the common ox in having a hump on the shoulders, in the abrupt descent of the back towards the tail, in the greater length of the legs, and in the narrower space between the horns.

GALLAND, Antoine, a French orientalist and numismatist, was born in 1646 at Rollot near Montdidier, in Picardy. In 1670 he accompanied the French ambassador, Nointel, to Constantinople, when he visited Jerusalem and other places. He returned to France in 1675, but subsequently made two voyages to the East. Colbert and Louvois interested themselves on his behalf, and procured him the means of devoting himself to study. In 1701, he was made a member of the Académie des Inscriptions, and in 1709, professor of Arabic in the Collége de France. He died 17th February 1715. The greatest part of G.'s writings relate to Numismatics and the East, but the thing which has secured him the most imperishable reputation, is his translation of the *Arabian Nights* in 12 vols. (*Mille et Une Nuits, Contes Arabes*, Paris, 1704–1708). This was the first translation of these grotesque and gorgeous stories ever made into any language of Christendom, and for a good while G. got the credit of being himself the author as well as the translator. Among his other writings, we may mention *Paroles remarquables, bons Mots, et Maximes des Orientaux* (Paris, 1694), and *Les Contes et Fables Indiennes de Bidpai et de Lokman* (2 vols., Paris, 1724).

GALLAS ('invaders'), a race inhabiting the south and east of Abyssinia. The general name by which the tribes designate themselves is *Oroma* (*orma*, men). Although generally belonging to the negro race, they are not purely negroes, but form with the Fulahs, Mandingoes, and Nubas, as it were, the transition to the Semitic variety, and seem to belong to that great family inhabiting the east of Africa, from the frontiers of the Cape land to Abyssinia, and usually denominated the Kafirs. They are a vigorous, well formed people, of a dark-brown colour, with hair frizzled, but not quite woolly, round faces, and small sharp eyes, and are distinguished not less by their energy and warlike spirit, than by their mental capacities. They first appear in history in the 16th c., as a barbarous people, extending their conquests from the interior of Africa, laying waste, by constant incursions, the countries of Eastern Africa, to the mountains of Abyssinia, gradually subduing or expelling the original inhabitants thence their name), occupying great part of Abyssinia, and advancing as far as the Red Sea and the Gulf of Aden. It is only of late years that their power in Abyssinia, and their incursions into that country, have been partially checked, chiefly by the vigorous government of the king of Shoa, who has subdued some of the G. tribes, and induced them to profess such Christianity as exists in Abyssinia. They still, however, occupy many districts of Abyssinia, and extend their power to an indefinite extent over the countries situated south and south-west of it. Politically, the G. do not form a single nation, but are divided into numerous tribes, forming separate kingdoms and states, which are frequently at war with each other. Most of the G. follow pastoral avocations. Some, however through intercourse with the semi-christian, semi-civilised Abyssinians, have become tillers of the soil. The wandering G. are mainly engaged in hunting and the slave trade. The larger number of the G. are still heathens, though Mohammedanism has lately made great progress among them. Their religion bears a resemblance to that of the Kafirs. Compare of the former, and supplying £1,000,000 of the latter. The chief British imports are cotton goods, iron (bars and sheet), coals, coffee, agricultural machinery; and colonial produce, spices, drugs, tea, sugar, &c. In 1871, the number of ships that entered the Danube for G. and the other river-ports of Roumania was 1911, with a burden of 392,845 tons, Great Britain owning more than a third of the tonnage. The population of G. is estimated at 80,000, and forms a medley of Moldavians, Greeks, Jews, Armenians, Italians, French, English, and Germans.

GALA'GO (*Galago* or *Otalicnus*), a genus of mammalia of the Lemur family, remarkable for the great length of the hind-legs, and the great size of the ears, which are membranous, and capable of being folded down as in bats. The head is rounded, the muzzle short, the eyes very large; all the feet have five toes; all the nails are flat, except those of the first digits of the hind feet, which are armed with sharp claws; the tail is very long, and almost bushy. The species are natives of Africa and Madagascar, varying from the size of a rabbit to that of a rat, more or less nocturnal in their habits, very lively and active, feeding partly on fruits and partly on insects; one of them (*G. Senegalensis*) is known in Senegal as the *gum animal*, from living much in acacias, and feeding, or being supposed to feed, on their gum. 'These pretty animals have all the activity of birds, leaping from bough to bough. They watch insects flitting among the leaves, listen to the fluttering of the moth as it darts through the air, lie in wait for it, and spring with the rapidity of an arrow, seldom missing their prize, which is caught by their hands.' When they leap, they always seize with their hands the branch on which they intend to rest. They make nests of grass and leaves for their young in the branches of trees. They are a favourite article of food in Senegal.

GALA'NGALE (*Alpinia*), a genus of plants of the natural order *Zingiberaceæ* or *Scitamineæ*, having perennial stems with terminal inflorescence and succulent fruit. The root-stocks possess stimulating properties similar to those of ginger. The true G. is the produce of *A. galanga*, a native of the Eastern Archipelago, and cultivated there; having a stem six or seven feet high, broad leaves, and a branched panicle of greenish-white flowers. The root-stock, when young, yields a kind of arrow-root, and is used as an article of food; it acquires pungency and aromatic properties as it becomes older. G. is much used in the East for the same purposes as ginger.

GALA'NTHUS. See SNOW-DROP.

GALAPAGOS ISLANDS (so named from *galápago*, the Spanish word for *tortoise*) are a volcanic group in the Pacific, situated on or near the equator, and in long. between 89° and 92° W. They are thirteen in number, the largest measuring 60 miles by 15, with an elevation of 4000 feet. They can hardly be said to be peopled, being visited chiefly for their turtles, which are of enormous size. The ten principal members of the cluster are Albemarle, Indefatigable, Chatham, Charles, James, Narborough, Hood, Barrington, Bindloes, and Abingdon.

GALASHIE'LS, the chief seat in Scotland of the Scotch tweed manufacture, occupies two miles of the narrow valley of the Gala, immediately above the junction of that river with the Tweed. It is 33½ miles south of Edinburgh, and 4 north of Melrose on the Waverley line. At its railway station are the junctions of a line to Selkirk, and of one that lies up Tweed valley to Peebles and the Caledonian. In 1630, G. was erected a burgh of barony. By the Reform Act of 1868, it is now a parliamentary burgh, and along with Hawick and Selkirk sends a member to parliament. It is governed by a council of 15—of whom one is provost and four are bailies. The parliamentary and municipal boundaries are co-terminous, but they exclude about one-eighth of the population. In 1871, the population within the burgh was 9678, but the population of the whole town was above 11,500. The town has no drainage system, and draws its water for domestic purposes chiefly from wells in the alluvial subsoil. Its principal claim is its manufacturing enterprise. It had, in 1873, 20 woollen factories containing 94 'sets' of carding engines, 810 power-looms, 413 hand-looms, 68,800 spindles—employing 3400 hands, and capable of turning out annually about £450,000 worth of goods. The product is almost exclusively the well-known woollen cloth called Scotch tweed. The mills are almost dependent on steam for motive power. The town has the largest and best appointed skinnery in Scotland. The boundary line between Melrose and Galashiels parishes intersects the town, and the burgh boundaries embrace portions of both parishes. This has been a cause of great confusion in the administration of the Public Health Act, and of the new Education Act.

GALATA, a suburb of Constantinople (q. v.).

GALA'TIA was in ancient times the name of a country of Asia Minor, and was so called from a body of Gauls who settled there. In the 3d c. B.C., great hordes of Gauls, under Brennus, invaded Greece. Some of them took possession of Byzantium and the Propontis, passed the Hellespont on the invitation of Nicomedes, king of Bithynia, in the year 278 B.C., subdued Troas and the north of Phrygia, and were first checked by Attalus, king of Pergamus, in a great battle about the year 239 B.C., and compelled by him to settle permanently within certain limits. The state of G., which hitherto had had no accurately defined boundaries, was now confined between Paphlagonia, Pontus, Cappadocia, Lycaonia, Phrygia, and Bithynia. It was also called Gallogræcia, and was peopled by numbers of Phrygians, Greeks, and Paphlagonians, as well as Gauls or Celts. The form of government was at first purely aristocratic, but at a later period the twelve tetrarchs who shared the government among them, in conjunction with a senate of 300 members, succeeded in making their dignity hereditary. At length one of them (30 B.C.), supported by Pompey, assumed the title of king. After his death, the kingdom descended to Amyntas, but was shortly after conquered by the Romans, and converted into a Roman province, divided under Theodosius into *Galatia prima*, with the capital Ancyra, and *Galatia secunda*, with the capital Pessinus. The majority of the Gauls of G. retained their old Celtic language as late as the time of Jerome (4th c.), who says that they spoke the same dialect as the people about Treves; and as Jerome had himself lived there, and was a good scholar, he may be regarded as an authority on the subject. G. was twice visited by the Apostle Paul.

GALA'TIANS, EPISTLE TO THE. This epistle was written by the Apostle Paul during his residence at Ephesus, probably about the year 56 A.D., and is generally reckoned the third or fourth of the Pauline epistles in the order of time. The circumstance which called it forth was the diffusion, throughout the Galatian churches, of Judaistic practices and notions, chief among which stood the famous rite of circumcision, regarded by Paul as the symbol of all that was exclusive, external, merely ical, and therefore thoroughly antagonistic to universality of the gospel. Paul had himself the first to preach Christ in this region, and the majority of his converts were Gentiles, would naturally vex him all the more keenly them lapsing into practices inconsistent ir new faith, and for which they had not excuse that might have been proffered Jews, viz., that antiquity had made such venerable. It would also appear that the ising adversaries of Paul had been circulating ious reports concerning himself, hinting that was no divinely appointed apostle, but at best ure messenger of the church of Jerusalem, he had quarrelled with Peter, the great apostle circumcision, and that he could play 'fast oose' on this very question of circumcision In his reply to the underhand attacks calumniators, Paul asserts the truth of his passionately declaring that he would pronce a curse on the very angels from heaven, if would dare to preach another, vindicates his and gives the true version of the story ance with Peter. He then proceeds to relation of Judaism to Christianity, and a series of exhortations and admonin, the first of which is the well-known 'Stand therefore in the liberty wherewith Christ hath le us free, and be not entangled again with the a of bondage' (v. 1). The commentaries on s are very numerous; among others may ned those of Luther, Winer, Rückert, De yer, Ellicott, and Alford.

ALATI'NA, S. PIETRO IN GALATINA, a town in of Italy, in the province of Otranto, is a fertile but unhealthy plain, 13 miles town of Lecce. Some maintain that very ancient place, but there seems no hisund for the assertion. G. is a thriving town, and possesses fine public edifices me churches. Pop. 8400. Raimondo s of Taranto, and Lord of Galatina, the town with ramparts, as a tribute ns for having ransomed him from the ,000 ducats.

ALATO'NE, a very ancient town in the south Italy, in the province of Lecce, about nine north-east of Gallipoli, is situated in a very but insalubrious plain. Pop. 5500. In the between Joanna Queen of Naples and G., having declared for the former, was by Alfonso, and its ramparts destroyed. It possessed by several illustrious families.

LAXY, THE (Gr. *gala*, *galaktos*, milk), or Way, is the great luminous band which etches across the heavens from horizon to and which is found, when carefully traced, a zone, completely encircling the whole ost in a great circle. At one part of it opens up into two branches, one faint rupted, the other bright and continuous, not reunite till after remaining distinct 150°. This great zone has occupied the ion in the heavens since the earliest ages. will find its course mapped out on any be, and a verbal account of it in Sir John *Outlines of Astronomy*, by which he may accuracy of the chart. That course, as the naked eye, following the line of its brightness, conforms nearly to that of a called the Galactic Circle, inclined at an out 63° to the equinoctial, and cutting in 0 hours 47 minutes, and 12 hours 47 ight ascension. Throughout the space above stated, it is divided into two branches, this great circle is intermediate to the two, lying nearer that which is the brighter and more continuous. The most casual survey of the Galaxy shews that it is wanting in regularity of outline. Besides the two great branches into which it divides, it has many smaller ones which spring out from it. At one point, it diffuses itself very broadly, and opens out into a fan-like expanse of interlacing branches nearly 20° in breadth. At the same point the branches terminating abruptly, a wide gap presents itself in the zone, on the opposite side of which it recommences its course with a similar assemblage of branches. At other points, its course is described by Sir John Herschel as 'irregular, patchy, and winding;' while at more than one point, in the midst of its brightest parts, broad dark spaces occur. One of these, known from early times among navigators as the 'coal-sack,' is a singular pear-shaped vacancy of about 8° in length, and 5° broad, occurring in the centre of a bright area overlying portions of the constellations of the Cross and Centaur. The 'coal-sack' occupies about half the breadth of this bright space, and presents only one star visible to the naked eye, though it contains many telescopic stars. Its blackness, which attracts the most superficial observer, is thus due to the contrast with the brilliant ground by which it is surrounded.

The Galaxy was examined by Sir William Herschel with his powerful telescope, and found to be composed entirely of stars. How a collection of stars can assume such appearances as are presented in the Galaxy, is explained in the article Stars (q. v.).

GALBA, SERVIUS SULPICIUS, Roman emperor from June 68 A.D. to January 69, was born 24th December 3 B.C., of a respectable family. He was raised to the consulship in 33 A.D.; and in the administration of the province of Aquitania under Tiberius, of Germany under Caligula, of Africa under Claudius, and of Hispania Tarraconensis under Nero, he distinguished himself for bravery, strictness, and justice. His friends had urged him, on the death of Caligula, to take possession of the throne, but he continued faithful to Claudius, and therefore stood high in his favour. In 68, Julius Vindex rose with the Gallic legions against Nero, and called on G. to assume the imperial dignity, and thus rid the earth of its oppressor. G., who had been informed that Nero was contriving his death, came forward against him at first as the legate of the Roman people, and it was only when he heard of Nero's death that he proceeded to Rome to take possession of the throne offered him by the Prætorians. G. was now upwards of 70 years old, and it soon appeared that his character had deteriorated, as, indeed, had already been manifested in his later administrations. Indulgence to greedy favourites, ill-timed severity, above all, avarice, which led him to withhold the usual donatives to the troops, made him unpopular. The legions in Upper Germany called on the Prætorians to choose another emperor; G. thought to soothe them by adopting Piso as his coadjutor and successor; but he thus offended Otho, who, as administrator of Lusitania, had supported G., and looked to be rewarded. The Prætorians, who had received no donative on occasion of Piso's adoption, were easily excited to insurrection by Otho, and the emperor having gone out to quell the rebellion, was cut down by the soldiers as he crossed the forum.

GA'LBANUM, a gum resin used in medicine in the same cases as assafœtida. It is principally employed in chronic catarrh, and has been given (especially by the Germans) in amenorrhœa and chronic rheumatism. It is generally administered in the form of the *compound galbanum pill*, which contains galbanum, sagapenum, assafœtida, myrrh, and soft soap. It is sometimes applied externally in plasters as a mild stimulant in indolent swellings. It is brought from the Levant, and appears in commerce either in tears or in large masses. It is soft, ductile, whitish, or, when long kept, yellowish in colour; has a peculiar balsamic odour, and an acrid, bitter taste. Although it has been known from the earliest ages, and is mentioned by Moses (Exod. xxx. 34) under the name *chelbenah* (translated galbanum in the English Bible), it is still uncertain from what plant it is derived. *Galbanum officinale*, *Ferula galbanifera*, and *Opoidia galbanifera*, all of the natural order *Umbelliferæ*, have, on various grounds, been supposed to be the source of galbanum; and the confidence with which they have been so represented has perhaps prevented travellers from making that inquiry into the subject which otherwise they might have made. It is highly probable that galbanum is the produce of an umbelliferous plant. *Bubon Galbanum*, a plant of this order, found at the Cape of Good Hope, yields a gum resin very similar to galbanum.
